was £26,920,000, which was £1,120,000 above the estimate. The income tax first began to produce £2,000,000 for each penny in 1889. Since then £1,440,000 a year has been given away in abatements to the poorer taxpayers, and yet in 1901 a penny of income tax produced over £2,400,000, and the total amount of income assessed has increased £120,000,000 in twelve years. The total receipts from customs in 1902 are estimated at £30,800,000; excise, £33,100,000; death duties, £14,000,000; stamps, £8,000,000; land tax and house duty, £2,500,000; income tax, £33,800,000. The total taxation revenue is estimated at £122,200,000, and non-taxation revenue at £21,055,000, making a total revenue of £143,255,000. Suspension of the sinking-fund brings the estimated expenditure down to £182,962,000, to which £1,250,000 must be added for interest on new debt.

The amount of the funded debt on March 31, 1900, was £552,606,989; the capitalized value of terminable annuities was £60,238,885; and the unfunded debt was £16,133,000, making a total of £628,978,783, not including £10,186,000 for reproductive services, of which £277,305 were borrowed under the Russian Dutch loan act of 1891, £95,335 under the imperial defense act of 1888, £2,810,014 under the barracks act of 1890, £1,456,145 under the telegraph act of 1892, £693,528 under the naval works acts of 1895 and 1899, £3,060,368 under the Uganda railway act of 1896, £454,903 under the act of 1895 for the acquisition of sites for public offices, £515,294 under the Whitehall public office act of 1897, and £823,590 under the Royal Niger Company act of 1899, which sums increase the total indebtedness to £639,165,265, against which may be offset £24,312,000, the value of the Suez Canal shares purchased from the Khedive, £868,461 of other assets, and £3,517,047 of exchequer balances in bank. The total debt on March 31, 1901, was £687,932,000, not including £14,731,000 for reproductive services, the debt having been increased £59,000,000 as the result of the war. The funded debt outside of war debt was increased £1,425,000 by the operation of life annuities, which can not be suspended when the sinking-fund is, and the terminable annuities were increased in capital value £1,378,000 through the fall in consols.

The Army.—The regular army of the United Kingdom in the year ending March 31, 1901, was, according to the estimates, composed of 9,365 officers, 1,290 warrant officers, 19,145 sergeants, 4,382 drummers and musicians, and 178,267 rank and file; total strength, 212,449 of all ranks, being 27,596 men above the strength for the preceding year. There were 354 officers and 136 men attached to the general staff, with 209 accountants, 86 chaplains, 96 surgeons, and 77 veterinarians; 551 officers, 1,336 non-commissioned officers and musicians, and 12,351 men in the cavalry; 1,473 officers, 3,281 non-commissioned officers and musicians, and 34,231 men in the royal artillery; 683 officers, 1,525 non-commissioned officers and musicians, and 7,749 men in the royal engineers; 3,382 officers, 8,208 non-commissioned officers and musicians, and 103,547 men in the infantry; 350 officers, 798 non-commissioned officers and musicians, and 11,042 men in the colonial corps; 243 officers, 1,107 non-commissioned officers, and 1,296 men in departmental corps; 490 officers, 1,303 non-commissioned officers, and 5,311 men in the army service corps; 550 officers, 485 non-commissioned officers, and 2,560 men in the medical corps; 613 officers, 6,101 non-commissioned officers, and 22 men on the staff of auxiliary forces; 36 officers, 110 non-commissioned officers, and 129 men instructing in gunnery and musketry; 102 officers, 280

non-commissioned officers, and 22 men at Woolwich, Sandhurst, and other colleges and schools, and 77 officers and 147 non-commissioned officers in other establishments. The estimates provided, moreover, for 217,551 additional imperial, colonial, and irregular forces during the war in South Africa, making the total strength, exclusive of India, 430,000 men of all ranks. The force maintained for service in the United Kingdom on Jan. 1, 1899, was 106,686 men of all ranks, consisting of 11,676 cavalry, 17,572 artillery, 5,351 engineers, and 72,087 infantry and special corps. Of the total number 79,057 were stationed in England, 3,942 in Scotland, and 23,687 in Ireland. There were at the same date 125,165 British soldiers stationed abroad, of whom 4,257 were in Egypt, 44,605 in the colonies, 74,466 in India, and 1,837 in Crete. The effective strength of the regular forces, home and colonial, in 1901 was reported to be 234,963; of the army reserve of the first class, 24,128; of the militia, 110,743; of the yeomanry, 10,114; of the volunteers, 230,785; total, 610,733 of all ranks at home and in the colonies, or 677,314, including 66,581 regular forces, on the Indian establishment. There were serving in South Africa on Dec. 1, 1900, 142,893 non-commissioned officers and men of the regular army, consisting of 11,600 cavalry, 12,700 artillery, 105,300 infantry, and 13,293 others; also 33,000 colonial troops, 8,000 imperial yeomanry, 7,500 volunteers, and 18,900 militia. The total strength of the forces in South Africa, exclusive of officers, was on that date 210,293. Of the non-commissioned officers and men serving in the British army on Jan. 1, 1899, there were 165,038 Englishmen, 17,285 Scotchmen, 28,358 Irishmen, 10,015 born in the colonies and India, 97 foreigners, and 1,580 not specified.

Army reform has been discussed since the first call for troops to go to South Africa, when only a single battalion could be sent from England without mobilization, and the inadequate reinforcement had to be slowly got together by drafts from India and from the colonial garrisons. The war has shown that better organization is required, and that Great Britain must be able to send at least 3 army corps abroad besides having a properly organized force for home defense. More artillery and mounted troops are needed; the transport and medical service requires to be reformed; the officers should be better trained; there should be less parade drill, and more musketry practice, scouting, and individuality. Apart from war, there must be maintained 115,000 men in India and the colonies, and this force depends on voluntary recruiting. The Government has decided to develop the existing system rather than either to establish a separate Indian army or to adopt compulsion for home defense, which could not in any case be taken up after a year which gave 140,000 voluntary recruits of various kinds. The system decided on by Mr. Brodrick, the Secretary of State for War, is the division of Great Britain and Ireland into the following six army corps districts: Aldershot, Salisbury Plain, Ireland, Colchester, York, and Scotland. Each district will contain troops of all arms necessary for an army corps, and will be provided with barracks, stores complete, and transport. The first 3 corps will consist entirely of regulars; the last 3 will contain 60 battalions of militia and volunteers and 21 militia and volunteer field-artillery batteries. Officers appointed to command in peace must be certified fit to hold the same commands in war. There will be large delegation of authority to army-corps commanders, the decentralization of authority, and the centralization of responsibility. Volunteers and militia in the army

corps will be specially trained. The corps composed of regulars are produced, not by greatly increasing the regulars, but by increasing them from garrison duty abroad; by establishing 5 garrison battalions of older soldiers; by employing 5 Indian battalions in certain stations; and by transferring small coaling stations to the navy, so as to avoid dual control. This will give 5 additional battalions, and will free 18 battalions from garrison duty abroad if the navy takes the coaling stations, otherwise 13 battalions. The militia will be raised from the strength of 100,000 to 150,000, and improved. Each man will receive 3d. a day for rations, as in the army, and will have after two trainings, in order to keep him, the total sum of £4 10s. instead of a 30s. bounty. All men after serving in the regular army and with the reserve, or after ten years of service in the militia, will be entitled to 4d. a day, or £6 a year, for joining the militia reserve for home defense. When necessary these men will be trained in musketry. The gain will be 50,000 men, without raising a single additional recruit. The yeomanry, to be known as the imperial yeomanry, corresponding to similar corps in the colonies, will be armed with rifles and receive horse allowance and extra pay. They will be raised to a strength of 35,000 men, furnishing mounted troops for home defense. The volunteers will consist of 25 battalions, 15 batteries of field-artillery, and 40 batteries of heavy field-artillery, to be specially trained for the army corps and for positions round London. They will have more drill and rifle shooting. The total number of new troops is 126,500, to cost an average of £15 a man, or less than £2,000,000 a year. The institution of these corps and the experience of the war entail reforms in artillery, in the drill and training of troops, in the education of officers, the modification of the rifle, and facilities for training by maneuvers. The home force, consisting of 155,000 regulars, 90,000 army reserves, 150,000 militia, 35,000 yeomanry, and 250,000 volunteers, will number 680,000 men. Of these 260,000 will constitute a field army, 196,000 garrisons at home, 100,000 the volunteers trained for the defense of London, and 4,000 on the staffs, making 560,000 effectives, and leaving a surplus of 120,000, representing the sick and untrained recruits. The question of reform in the War Office was left to be considered by a committee of which Clinton Dawkins was chairman, and to some of its recommendations the Secretary of State gave effect. One of the reforms in the War Office decided upon is to increase the military element considerably.

The army maintained in South Africa throughout 1901 was 200,000 strong, and 30,000 troops were despatched to China, mostly from India. The removal of Major-Gen. Sir Henry Colville from the command of Gibraltar, and his enforced retirement on half-pay, drew upon the Government the censure of its opponents in Parliament. He was dismissed on the advice of Sir Evelyn Wood and the recommendation of Lord Roberts, commander-in-chief of the army, because he failed to succor Gen. Broadwood at Sanna's Post, in the Orange Free State, withdrawing his force when close to the scene of the disaster. Much stronger criticism was directed at the Government by supporters as well as adversaries when the officers selected to command the three army corps of regulars were announced—Sir Redvers Buller, Sir Evelyn Wood, and the Duke of Connaught. Gen. Buller, who had failed to relieve Ladysmith, but sacrificed many soldiers in the attempt after first advising the commander of the garrison to surrender, was acknowledged to be no suitable com-

mander in war for the first corps, in that his appointment was described as a preliminary to his retirement. He replied in an angry speech to his assailants, and when, yielding to the outcry, the Government canceled the appointment, another storm of reproaches broke out, and the officer, who was liked in society and in the army, became a popular hero, Major-Gen. Sir John P. D. French was assigned to the command of the first army corps. The War Office will henceforth be constituted very much as it was before the last transformation, with the Secretary of State as president of the council, the commander-in-chief next, and as other members the Parliamentary and Permanent Under-Secretaries, the Financial Secretary, the Quartermaster-General, Inspector-General of Fortifications, Director-General of Ordnance, Adjutant-General, Director-General of Mobilization and Intelligence, Director-General of the Medical Department, the Secretary of the Council, and any staff-officers that may be specially summoned. An executive committee is constituted, consisting of the Permanent Under-Secretary and the deputy chiefs of the several departments, who will consider all important matters concerning more than one department, and each department will have its special committee, to report to the Permanent Under-Secretary. The Director-General of the Medical Department is added to the Army Board, which, in addition to its present duties, will consider the annual estimates of each department and the allocation of sums allotted for military purposes, the establishments of officers and men of the regular, militia, yeomanry, and volunteer forces, and any subject submitted for discussion by the commander-in-chief or the chief of a department.

The army estimates for the year ending March 31, 1902, provide for a total expenditure of £87,915,000, about £1,000,000 less than the expenditures, including supplementary estimates, for the year ending March 31, 1901. The war expenses were computed at £58,230,000, against £64,736,000 in the previous year. Permanent additions and automatic increases of expenditure make the ordinary expenditure £25,450,000, not including the additions proposed in the new army scheme, the expense of which was estimated at £1,912,000, nor the annual installment for the rearmament of fortresses and the accumulation of stores approved by Parliament in 1901.

The Navy.—There were 14 first-class battle-ships completed on Jan. 1, 1901; launched, but not ready, 7; building or projected, 8; second-class battle-ships ready for service, 12; third-class battle-ships ready, 11; armored cruisers, 6 completed, 8 launched and completing, and 6 building or authorized; protected cruisers, 125 completed and 2 building; torpedo gunboats, etc., 33 completed; destroyers, 96 completed, 1 launched, and 12 ordered; first-class torpedo-boats, 11 ready and 4 building; second-class torpedo-boats, 71; torpedo-vessels, 2; antiquated battle-ship, 13; coast-defense vessels, 10; third-class torpedo-boats, 95. In the year ending March 31, 1901, there were under construction 15 battle-ships, 20 armored cruisers, 2 second-class cruisers, 8 sloops, 41 destroyers, 4 torpedo-boats, and 1 royal yacht. There were 174 vessels in commission on Jan. 1, 1901, of which 43 were in the Mediterranean and the Red Sea, 14 formed the Channel squadron, 15 were stationed on the coast of North America and in the West Indies, 10 in the East Indies, 30 in the China seas, 16 at the Cape of Good Hope and on the west coast of Africa, 8 in the Pacific, 12 in Australia, 4 on the southeast coast of America, 11 were on particular service, 7 were on surveying service, and 4 formed the training squadron.

The estimates of 1901 provided for 82,821 officers and men on sea-service, 4,200 in the coast-guard, 18,590 marines, 1,531 officers and men and 215 marines on other services, 1,003 pensioners, and 6,520 boys in training, making a total of 114,880 of all ranks, an increase of 4,240 over the previous year. The estimates of 1902 provided for a further increase of 3,745 officers and men, making the total number of 118,635. The sum voted for the navy was £30,875,500, against £28,791,900 in 1901. The ship-building vote showed an increase of £1,274,900.

The vessels built since 1896, including the Canopus class, are fitted with water-tube boilers. Construction of the later ships of this class and those of the newer Formidable class, as well as armored cruisers, destroyers, etc., was delayed by the engineering strike. The Formidable, launched at Portsmouth on Nov. 17, 1898, the Irresistible, launched at Chatham in December, 1898, and the Implacable, built at Devonport, are improved Majestics having a displacement of 14,700 tons, driven by 15,000 horse-power, developing a speed of 18 knots, and armed with 4 12-inch guns in barbettes, and 12 6-inch and 16 3-inch quick-firers. According to the program for 1899 3 others of this class have been built. The London was launched in September, 1899, and was followed by the Bulwark and the Venerable. A supplementary program called for 4 more battle-ships of 14,000 tons, and 2 have since been added. The vessels of this class are named the Duncan, Cornwallis, Russell, Exmouth, Montagu, and Albemarle. They have 11-inch armor, an armament of 4 12-inch, 12 6-inch, and 12 3-inch guns, and engines of 18,000 horse-power, capable of making 19 knots. The Canopus, Ocean, Goliath, Albion, Glory, and Vengeance displace 12,900 tons, carry 4 12-inch guns, 12 6-inch quick-firers, and 6 12-pounders, and with 13,500 horse-power make 18½ knots. The protected cruisers Powerful and Terrible, of 14,200 tons, armed with 9.2-inch guns fore and aft and 12 6-inch quick-firers, 18 12-pounders, and 12 3-pounders, have made 22 knots with 25,000 horse-power. The Dido, Doris, Isis, Furious, Gladiator, Vindictive, Arrogant, Hermes, Hyacinth, and Highflyer, of 5,600 and 5,750 tons, have powerful quick-firing armaments, and can steam 19 and 19½ knots. The Diadem, Andromeda, Niobe, Europa, Spartiate, Argonaut, Amphitrite, and Ariadne, of 11,000 tons, carry quick-firing guns only, 16 6-inch, 14 12-pounders, and 20 small ones, and with 16,500 horse-power engines are designed to make 20½ knots. The Cressy, Hogue, Aboukir, Sutlej, Euryalus, and Bacchante, armored cruisers, of 12,000 tons, have 21,000 horse-power engines, giving a speed of 21 knots, and have the same main armament as the Powerful. The Kent, Monmouth, Bedford, and Essex, also armored, armed with 14 6-inch quick-firers and 13 small ones, displace only 9,800 tons, but have engines of 22,000 horse-power, giving a speed of 22 knots. They are 440 feet long, with 66 feet beam and 24½ feet draught, and have 4 inches of armor on their sides. The armored cruisers Drake, King Alfred, Leviathan, and Good Hope have 14,100 tons displacement, and will have engines of 30,000 horse-power, expected to develop a speed of 23 knots, with an armament a little stronger than that of the Powerful. The Berwick, Cornwall, Cumberland, Donegal, Lancaster, and Suffolk, armored cruisers of the same size as the Kent class, have 14 7.5-inch quick-firers and many small ones. The Encounter and Challenger are new protected cruisers of 5,600 tons, able to make 19½ knots and carry 11 6-inch and 15 small quick-firers. The Queen and the Prince of Wales

are first-class battle-ships of the London type, having the same armament, with a displacement of 15,000 tons and engines of 18,000 horse-power, giving a speed of 19 knots. A further development is reached in the 3 battle-ships of the program of 1901, named the King Edward VII, the Commonwealth, and the Dominion, which will have a displacement of 16,500 tons, being 420 feet long, 20 feet longer than the London, and with engines of 18,000 horse-power are expected to be half a knot faster. They will have a protective deck above the machinery and below the water-line, an armor belt reaching 9 inches above the water-line, where it is joined to another belt that rises to the main deck and encircles the entire ship. The armament will consist of 4 12-inch guns, 4 9.2-inch guns, and 10 6-inch guns in casemates of 7-inch armor, with shields separating the 6-inch guns to limit the effect of a bursting charge in any gun to its own crew. The program provides also for the construction of 6 more first-class armored cruisers and 10 destroyers. The cruisers will be improved Monmouths, larger, swifter, with stronger armor and heavier guns. The first-class protected cruiser Spartiate was completed early in 1901. The Challenger and Encounter, of the second class, are an improvement on the Hermes type, having a displacement of 5,600 tons, 1 11-inch and 15 small guns, and 19½ knots speed. They have no wood or copper sheathing. The Pandora is a new third-class cruiser, the only one built lately. The destroyer Viper, with turbine wheel, attained a speed of over 40 knots in the trial in 1900. In the Cobra the same design was followed, which is reproduced with improvements in the latest destroyers. The hulls of these vessels have been found to be too weak for the machinery.

Aug. 3, 1901, the Viper, after striking a rock near Alderney, broke into halves. On Sept. 18, during a storm the Cobra, the only other vessel fitted with the Parsons turbine engines, broke into two pieces in the open water during the naval maneuvers off the North Sea coast of England, and 67 lives were lost, including that of the inventor of the engines, which on these 400-ton vessels, built of ½-inch steel, had the same power as those placed in 10,000-ton battle-ships. Every one of the 113 destroyers completed before March 31, 1901, has water-tube boilers. The first 42 made 26 knots or over on trial; then 66 were ordered to show 30 knots, and in the last 5 a higher speed was demanded. The Albatross made 31½ knots, the Viper with the Parsons engine made in a continued trial 33½ knots, and the Cobra maintained a speed of over 30 knots for three hours with her full load. A speed of 32 knots was demanded in the next one, and in the last one on the program 33 knots. The Government purchased 5 more destroyers, and in 1901 ordered 10 others. The latest torpedo-boats, 4 in number, have a speed of 25 knots. The ship-building program for 1901 comprises 3 battle-ships, 6 armored cruisers, 2 third-class cruisers, and 5 torpedo-boats, besides the 10 destroyers; also 5 submarine boats, on which work was begun in 1900. Parliament voted £9,003,256 to be spent in naval construction during the year ending March 31, 1901. The battle-ships of the Formidable class are armed with a new 12-inch breech-loading wire gun, those of the Cressy class with 9.2-inch breech-loaders of new pattern, and a new gun of 7.5-inch caliber has been adopted. The older machine guns are replaced with .303-inch Maxims. Telescopesights are provided for quick-firing guns. Many of the ships are equipped with wireless telegraph apparatus. A parliamentary committee has given its approbation to the water-tube boiler

for the navy; but the Belleville pattern, with which many ships have been fitted, is condemned.

Commerce and Production.—The area of grain crops in Great Britain in 1900 was 7,335,408 acres, and in Ireland 1,346,978 acres; the area of green crops in Great Britain was 3,180,422 acres, and in Ireland 1,098,871 acres. Flax was grown on 467 acres in Great Britain and 47,327 acres in Ireland, the hop vine on 51,308 acres in Great Britain; 308,108 acres in Great Britain and 12,645 acres in Ireland were bare fallow, 4,759,158 acres in Great Britain and 1,218,009 acres in Ireland were under grass and clover, and 16,729,035 acres in Great Britain and 11,505,187 acres in Ireland were permanent pasture. Of 32,346,000 acres, the total area of England, 11.9 per cent. is uncultivated, 5.1 per cent. is woodland, 6.9 per cent. grazing land and heath, and 76.1 per cent. is under crops and grass. In Wales, having an area of 4,774,000 acres, 12.1 per cent. is uncultivated, 3.8 per cent. woods, 24.8 per cent. heath and pasture, and 59.3 per cent. under crops and grass. The area of Scotland is 19,456,000 acres, of which 21.9 per cent. is barren, 4.5 per cent. woods, 48.4 per cent. heath and grazing land, and 25.2 per cent. under crops and grass. In Ireland, with a total area of 20,334,000 acres, 23.6 per cent. is barren, 1.5 per cent. woodland, 52 per cent. grazing land and heath, and 22.9 per cent. under farm crops and grass. The total area of Great Britain is 56,782,000 acres, including 588,000 acres of inland waters. The surface of mountain and heath land is over 12,900,000 acres, nearly three-fourths of it being in Scotland. Of the total area of the island 86 per cent. is utilized, 32,437,000 acres being under crops and cultivated grasses. The extent of arable land has fallen from 18,335,000 acres in 1870 to 15,708,000 acres in 1900, while the permanent pasture has increased from 12,073,000 to 16,729,000 acres. The land devoted to wheat, turnips, and clover has decreased, also the extent of bare fallow, while the areas under oats, mangolds, cabbage, and miscellaneous green crops have increased, as well as cultivated pasture. The wheat area shows the greatest reduction, from over 4,500,000 acres in 1870 to less than 1,500,000 acres in 1900.

The live stock in Great Britain in 1900 comprised 1,500,143 horses, 6,805,170 cattle, 26,592,226 sheep, and 2,381,932 pigs; in Ireland, 491,143 horses, 4,608,443 cattle, 4,386,697 sheep, and 1,268,474 pigs. There was a decrease of about 16,000 in the number of horses and 647,000 in sheep, and in cattle a slight increase. The area planted to wheat in 1900 was 1,845,042 acres in Great Britain and 53,797 acres in Ireland; to barley, 1,990,265 acres in Great Britain and 174,184 acres in Ireland; to oats, 3,026,088 acres in Great Britain and 1,104,848 acres in Ireland; to beans, 263,240 acres in Great Britain and 2,296 acres in Ireland; to peas, 263,240 acres in Great Britain and 443 acres in Ireland; to potatoes, 561,361 acres in Great Britain and 654,413 acres in Ireland; to turnips, 1,688,606 acres in Great Britain and 297,895 acres in Ireland. The production of wheat in the United Kingdom in 1899 was 1,731,000 bushels; of barley, 6,817,000 bushels; of oats, 51,393,000 bushels; of beans, 85,000 bushels; of peas, 10,000 bushels; of potatoes, 2,760,000 tons; of turnips, 4,309,000 tons. The average yield of wheat was 33.38, of barley 40.17, of oats 45.26, of beans 42.63, of peas 23.95 bushels to the acre; of potatoes 4.16, and of turnips 14.29 tons.

The quantity of fish landed on the coasts of England and Wales in 1900 was 429,641 tons, on the coast of Scotland 268,457 tons, on the coast of Ireland 30,189 tons; total, 728,287 tons, valued at

£9,210,297. Including shell-fish, the value was £9,673,274. The number of men employed in the fisheries in 1899 was 108,513; the number of boats, 26,573. The quantity of fish conveyed inland was 488,181 tons in 1899, and the net imports were 104,779 tons, valued at £2,693,946; exports of herrings, £2,205,217; total fish exports, £2,931,262.

The production of iron ore in the United Kingdom in 1899 was 14,461,330 tons, valued at £3,895,485, containing 4,913,846 tons of iron, value £17,034,874. The production of iron pyrites was 12,230 tons, value £4,671; production of lead ore 30,999 tons, valued at £296,784, containing 23,552 tons of metal, worth £355,379; production of tin ore, 6,392 tons, valued at £440,509, containing 4,013 tons of metal, value £508,094; production of copper ore, 8,144 tons, valued at £33,798, containing 637 tons of metal, worth £49,768; production of copper precipitate, 175 tons, value £1,550; production of zinc ore, 23,135 tons, valued at £139,482, containing 8,698 tons of metal, worth £220,132; production of bog iron ore, 4,321 tons, value £1,080; production of alum clay and shale, 13,829 tons, valued at £2,599, containing 550 tons of metal, worth £71,125; production of sodium, 380 tons, value £41,350; production of silver, 191,127 ounces, value £21,942; production of gold ore, 3,047 tons, valued at £10,170, containing 3,327 ounces of metal, value £12,086.

The total value of metallic ores was £4,826,178, and of their metallic contents when extracted £18,314,750. The quantity of clay of all kinds quarried in 1899 was 15,064,857 tons, value £1,542,657; of sandstone, 5,212,624 tons, value £1,653,704; of slate, 639,840 tons, value £1,787,071; of limestone, 12,302,890 tons, value £1,335,067; of salt, 1,914,893 tons, value £644,174; of oil shale, 2,210,824 tons, value £553,003; of granite, 4,709,925 tons, value £1,095,763; of chalk, 4,678,132 tons, value £209,629; of gravel and sand, 1,771,276 tons, value £132,399; of gypsum, 212,563 tons, value £76,456; of arsenic and arsenic pyrites, 17,348 tons, value £66,374; of barytes, 24,664 tons, value £25,644; of ochre, 16,314 tons, value £13,579; value of other minerals, excluding coal, £27,511; production of coal, 220,094,781 tons, value £83,481,137; value of all non-metallic minerals, £92,644,168; value of total mineral production in 1899, £97,470,296, of which £68,240,751 represent English, £15,102,883 Welsh, £13,843,230 Scotch, £220,130 Irish, and £63,302 Manx products. The number of persons employed in mines was 764,166, of whom 729,009 worked in 3,216 coal-mines and 35,157 in 794 metalliferous mines. The value of the mineral products of the United Kingdom in 1898 was £77,415,063, the increase of £20,000,000 in 1899 being due to increased production and enhanced price of coal. The exports of coal in 1899 were 43,111,404 tons, valued at £23,093,250, compared with 36,562,796 tons, valued at £18,135,502 in 1898. Of the total exports in 1899 France took 6,870,365 tons, Italy 5,526,995 tons, Germany 5,058,573 tons, Sweden 3,049,121 tons, Russia 3,397,692 tons, Egypt, 2,125,924 tons, Spain 2,291,439 tons, Denmark 2,052,807 tons, Norway 1,445,008 tons, the Argentine Republic 1,001,251 tons, Holland 1,288,829 tons, and the rest went principally to Brazil, Belgium, Portugal, and Algeria. The exports of coal in 1900 were 44,089,197 tons, of which 18,459,207 tons were shipped from Welsh ports, Gloucester, and Bristol, 13,135,435 tons from Northumberland, Durham, and other northeastern English ports, 5,779,153 tons from ports on the east coast of Scotland, and 1,597,941 tons from western Scottish ports. To northern Russia, Denmark, Germany, Holland, Belgium, Iceland, and the whale fisheries the

quantity supplied was 18,108,371 tons; to France, central Europe, the Balkan countries, southern Russia, Egypt and other Mediterranean countries, the Azores, and Madeira, 21,067,742 tons. From Cardiff alone 13,383,319 tons were shipped. The coal shipped for the use of steamers in 1900 was 11,752,316 tons, against 12,226,801 tons in 1899.

The imports of iron ore in 1899 were 7,054,578 tons, valued at £5,374,918, of which 6,186,022 tons, valued at £4,598,636, came from Spain. The total quantity of iron ore produced and imported in 1899 was 22,041,788 tons. There were 411 furnaces in blast which smelted 22,820,302 tons of ore, producing 9,421,435 tons of pig iron. The imports of pig and puddled iron were 171,373 tons and the exports 1,380,342 tons. The exports of bar and angle iron were 159,659 tons; of rails, 590,667 tons; of wire, 48,498 tons; of plates for tinning, 85,729 tons; of tin plates, 256,373 tons; of cast and wrought iron, 358,773 tons; of hoops and plates, 347,937 tons; of old iron, 115,726 tons; of steel, 329,309 tons; of steel and iron, 44,167 tons; total iron and steel, 3,717,180 tons. The importation of copper ore and regulus was 207,381 tons; of copper, 65,784 tons; of lead, 198,377 tons; of tin, 27,173 tons; of zinc, 69,949 tons.

The quantity of raw cotton imported in 1899 was 1,626,246,944 pounds; retained for home consumption, 1,342,314,176 pounds; exported, 283,932,768 pounds. The importation of raw wool was 668,817,315 pounds, of which 292,937,192 were exported and 375,880,123 pounds retained for consumption. The consumption of cotton in 1900 was 1,690,500,000 pounds; of wool, 616,000,000 pounds; of flax, 197,000,000 pounds. The value of cotton manufactures was £68,665,000; of woollens, £21,601,000; of linen, £5,867,000; total textile manufactures, £96,133,000. The imports of raw cotton in 1900 were 1,762,000,000 pounds, of which 216,000,000 pounds were exported. The supply of wool, hair, etc., was 821,000,000 pounds, of which 559,000,000 pounds were sheep and lamb wool, 30,000,000 pounds obtained from imported sheepskins, 141,000,000 pounds produced in the United Kingdom, 22,000,000 pounds imported goats' hair, and 69,000,000 pounds imported woolen rags; exports of foreign wool were 195,000,000 and of domestic wool 25,000,000 pounds, leaving for home consumption 601,000,000 pounds. The imports of flax and tow were 160,000,000 pounds, the home production 16,000,000 pounds, the exports 9,000,000 pounds, leaving 167,000,000 pounds for home consumption. The exports of cotton piece goods were 5,034,000,000 yards; of woollens, 173,000,000 yards; of linen, 155,000,000 yards; of cotton yarn, 158,000,000 pounds; of woollen yarn, 57,000,000 pounds; linen yarn, 16,000,000 pounds. The total value of cotton manufactures exported in 1900 was £69,700,000; of woollen manufactures, £21,700,000; of linen manufactures, £6,100,000; total textile manufactures, £97,500,000.

The total value of imports into the United Kingdom in 1900 was £523,633,486; exports of British and Irish produce and manufactures, £291,451,306; exports of foreign and colonial produce and manufactures, £63,099,288. The total value of the foreign commerce was £878,184,080, or £21 8s. 3d. per capita. The share of England in the total commerce of 1899 was 90.6 per cent., that of Scotland 7.9 per cent., that of Ireland 1.5 per cent. Of £485,035,583, the total value of imports in 1899, British possessions supplied £106,829,295, while £378,206,288 came from foreign countries. Of £264,492,211, the value of exports of British and Irish produce and manufactures, £87,597,468 went to British possessions and £176,894,743 to foreign countries. The im-

ports of live animals for slaughter in 1900 were £9,614,637 in value; of articles of food and drink free of duty, £178,513,847; of articles of food and drink paying duty, £27,242,421; of tobacco, £4,816,399; of metals, £33,186,303; of chemicals, dyes, and tanning substances, £5,768,374; of oils, £9,690,576; of textile materials, £65,971,462; of raw materials for various industries, £56,777,299; of manufactured articles, £91,310,487; of miscellaneous articles, £16,768,990; imports by parcel-post, £1,119,625. The domestic exports of live animals were £903,945 in value; of articles of food and drink, £13,612,364; of raw materials, £41,862,269; of yarns and textile fabrics, £102,230,983; of metals and metal manufactures, £45,422,986; of machinery and mill work, £19,621,557; of new ships, £8,608,153; of apparel and articles of personal use, £10,400,349; of chemicals and medicinal preparations, £9,271,510; of other articles manufactured or partly manufactured, £36,565,410; by parcel-post, £2,951,800. The importation of wheat was 16,031,800 quarters. The total imports of cereals, including flour, were 189,572,329 hundredweight; imports of potatoes, 8,903,534 hundredweight; of rice, 6,290,803 hundredweight; of hams and bacon, 7,443,918 hundredweight; of fish, 2,226,898 hundredweight; of refined sugar, 19,253,478 hundredweight; of raw sugar, 13,276,692 hundredweight; of tea for consumption, 249,792,086 pounds; of butter, 3,378,516 hundredweight; of margarin, 920,416 hundredweight; of cheese, 2,711,805 hundredweight; of beef, 4,322,738 hundredweight; of preserved meat, 804,471 hundredweight; of fresh mutton, 3,392,850 hundredweight; of the number of sheep and lambs, 382,822; number of cattle, 495,134; great hundreds of eggs, 16,881,838; proof gallons of spirits, 8,764,550; gallons of wine for consumption, 15,880,069. Of the wheat imports 10,135,200 hundredweight came from British possessions and 58,480,790 hundredweight from foreign countries, of which the United States provided 32,588,470, the Argentine Republic 18,524,000, Russia 4,421,500, Germany 1,828,300, Roumania 756,100, Turkey 131,200, and Chile 2,500 hundredweight, while of the British possessions Canada sent 6,337,600, Australasia 3,788,200, and India 9,400 hundredweight. The imports of flour were 21,542,035 hundredweight, of which 17,871,307 hundredweight came from the United States. Of the imports of tea 49.61 per cent. came from India, 35.20 per cent. from Ceylon, 11.99 per cent. from China, 1.84 per cent. from Dutch possessions, and 1.36 per cent. from other countries. The value of grain and flour imported in 1900 was £58,921,510; of raw cotton, £41,027,181; of meat, £36,152,710; of timber and wood, £27,877,443; of sheep and lamb wool, £21,836,184; of sugar, raw and refined, £19,274,491; of butter and margarin, £19,915,371; of silk manufactures, £14,291,242; of woolen manufactures, £11,472,231; of tea, £10,929,723; of flax, hemp, and jute, £10,028,379; of hides and leather, £8,792,934; of fruit and hops, £8,448,979; of iron manufactures, £8,307,421; of seeds, £7,550,462; of cheese, £6,853,317; of iron ore, £5,639,003; of eggs, £5,406,141; of copper, £5,276,859; of wines, £5,201,594; of tin, £4,359,133; of copper ore and regulus, £4,690,548; of lead, £3,319,574; of currants and raisins, £3,237,362; of coffee, £2,578,465; of zinc and zinc manufactures, £2,001,737; of pig and puddled iron, £1,461,332; of steel, £1,218,179. The exports of cotton yarn and manufactures and yarn were £69,775,339 in value; of coal and coke, £38,606,446; of iron and steel and manufactures thereof, £32,017,157; of woolen and worsted yarn and manufactures, £21,790,823; of machinery, £19,621,557; of chemicals,

£9,271,510; of apparel and haberdashery, £6,826,373; of linen manufactures, £6,215,301; of manufactured copper, £2,931,793; of hardware and cutlery, £2,139,423; of jute manufactures, £1,959,886; of linen yarn, £935,009; of jute yarn, £486,222. The exports of cotton fabric yarn were £62,032,313, and of cotton yarn £7,743,926; of woolen and worsted fabrics £15,665,250, and of woolen and worsted yarn £6,125,573. The total for iron and steel exports included £5,998,731 for pig iron, £1,541,058 for bar, bolt, rod, and angle iron, £3,202,251 for railroad iron of all sorts, £904,567 for wire, £3,978,376 for tin plates, £4,727,945 for hoops, sheets, and plates, £5,872,457 for cast and wrought iron of all sorts, £375,280 for old iron, and £5,416,492 for steel and mixed iron and steel manufactures.

The imports from British possessions and the exports to British possessions of British and Irish produce and manufactures in 1899 were:

BRITISH POSSESSIONS.	Imports.	Exports.
India.....	£27,740,503	£31,316,412

The imports of gold in 1900 were £26,190,873, and exports £18,397,459; imports of silver were £13,322,300, and exports £13,574,580.

Navigation.—The total number of vessels entered at the ports of the United Kingdom during 1899 was 359,821, of 105,188,504 tons; the total number cleared was 356,079, of 104,159,577 tons. This includes 292,416, of 56,312,586 tons, entered and 289,309, of 55,252,608 tons, cleared coastwise. The tonnage of vessels engaged in foreign trade entered at British and Irish ports during 1899 was 48,876,000 tons, of which 32,865,000 tons were British and 16,011,000 tons were foreign. The tonnage cleared in the foreign trade was 48,907,000 tons, of which 32,784,000 tons were British and 16,123,000 tons were foreign. The tonnage of vessels entered with cargoes from foreign countries was 36,226,000, of which 25,453,000 tons were British and 10,773,000 tons were foreign. The tonnage cleared with cargoes was 42,988,000, of which 28,968,000 tons were British and 14,020,000 tons were foreign. The total tonnage entered and cleared with cargoes was 79,214,000, of which 54,422,000 tons were British and 24,793,000 tons were foreign. With cargoes and in ballast the total foreign tonnage entered and cleared was 32,133,898 tons, and of this Norway had 7,442,597 tons, Germany 5,238,057 tons, Denmark 3,375,632 tons, Sweden 3,318,348 tons, the Netherlands 2,950,447 tons, France 2,535,136 tons, Spain 2,006,440 tons, Belgium 1,474,438 tons, Italy 1,087,806 tons, Russia 903,547 tons, the United States 569,979 tons, and Austria 413,229 tons. Of the total tonnage entered and cleared in the foreign trade London had 16,529,075 tons, Cardiff 13,420,355 tons, Liverpool 11,818,000 tons, Newcastle 6,170,720 tons, Hull 4,585,183 tons, Glasgow 3,612,934 tons, Southampton 3,122,453 tons, Newport 2,848,897 tons, Blyth 2,553,069 tons, Swansea 2,193,090 tons, Middlesbrough 2,099,409 tons, Shields 2,078,392 tons, Sunderland 1,949,076 tons, Grimsby 1,911,513 tons, Kircaldy 1,810,486 tons, Leith 1,795,726 tons, Grangemouth 1,534,851 tons, Harwich 1,436,695 tons, Manchester 1,196,382 tons, Bristol 1,151,221 tons, and Hartlepool 889,876 tons.

The number of vessels registered as belonging in the United Kingdom on Jan. 1, 1900, was 20,196, of 9,164,342 tons, of which 11,167, of 2,246,850 tons, were sailing vessels and 9,029, of 6,917,492 tons, were steamers. The number of vessels engaged in the home and foreign trade in 1899 was 15,197, of 9,246,634 tons, employing 244,135 men, of whom 36,064 were foreigners, exclusive of 33,805 Lascars. The total number of vessels belonging to the British Empire was 34,896 in 1899, of 10,602,199 tons. Of the vessels engaged in the home and foreign trade in 1899 the number in the home trade alone was 6,485 sailing vessels of 397,177 tons, and 3,295 steamers of 476,449 tons; and 178 sailing vessels, of 20,250 tons, and 338 steamers, of 308,898 tons, were engaged partly in the home and partly in the foreign trade, while 1,236 sailing vessels, of 1,700,548 tons, and 3,665 steamers, of 6,343,312 tons, were engaged exclusively in the foreign trade. The number of vessels built and first registered in the United Kingdom during 1899 was 1,245, of 749,414 tons, comprising 570 sailing vessels, of 45,510 tons, and 675 steamers, of 703,904 tons. The number of vessels built for foreigners was 241, of 199,596 tons, of which 53, of 4,973 tons, were sailing vessels and 188, of 194,623 tons, were steamers.

Railroads, Posts, and Telegraphs.—The total length of railroads open to traffic in the United Kingdom on Jan. 1, 1900, was 21,700 miles, of which 15,044 miles were in England and Wales, 3,480 miles were in Scotland, and 3,176

miles were in Ireland. There were 181 miles built during the year. The paid-up share and loans capital amounted to £1,152,317,501. The number of passengers carried during 1899 was 1,106,691,991, exclusive of holders of season tickets. The receipts from all sources were £101,667,065, of which £43,734,399 came from passengers and £52,116,399 from freight. The working expenses were £60,090,687, being 59 per cent. of the gross receipts. There were 1,177 miles of tramways on June 30, 1900, the receipts of which for the year were £4,075,352; number of passengers carried, 1,065,374,347; paid-up capital, £20,582,692; net receipts, £1,370,277.

The number of letters that passed through the British post-office during the year ending March 31, 1900, was 2,246,800,000, of which 1,908,900,000 were delivered in England and Wales, 196,890,000 in Scotland, and 141,100,000 in Ireland, being 55 letters per capita for the whole United Kingdom, 60 letters for England and Wales, 46 letters for Scotland, and 31 letters for Ireland. The number of post-cards carried during the year was 400,300,000; book packets, 702,800,000; newspapers, 163,400,000; parcels, 75,400,000; money orders, 12,087,459, for the total amount of £35,201,262, of which 10,292,890, for the amount of £30,505,351, were inland orders; the number of postal orders, 82,115,674, for £28,633,884. The telegraphs had on March 31, 1900, a length of 44,970 miles, with 329,660 miles of wire. The number of messages sent during the year was 90,415,123, of which 76,116,209 were sent in England and Wales, 9,387,975 in Scotland, and 4,910,939 in Ireland. There are 68,657 miles of long-distance telephone lines, and 16,189,156 conversations were held in the year ending March 31, 1900, from the post-offices, while the telephone company had 988 exchanges, in which 639,476,448 conversations were held. The postal revenue for the year ending March 31, 1900, was £13,394,335, and the expenses were £9,683,704, leaving a net revenue of £3,710,631. The total telegraph receipts were £3,460,492, and expenses £3,748,930, leaving a deficiency of £288,438, reducing the net postal and telegraph revenue to £3,422,193, from which should be deducted £298,888, the annual interest on the debt incurred for the purchase of the telegraphs from private companies in 1870.

The Session of Parliament.—The Parliament elected in October, 1900, met in extraordinary session in December purely for the purpose of sanctioning supplementary estimates for the expenses of the war in South Africa, and after a discussion of the war lasting two weeks the session was closed. The death of Queen Victoria on Jan. 22, 1901, necessitated the assemblage of Parliament, which held a formal session on the following day, when members of both houses who were present took the oath of allegiance to King Edward VII. After the delivery of tributes to the virtues of the deceased sovereign there was an adjournment till the middle of February. When the members of the Privy Council were sworn, King Edward declared his determination to be a constitutional sovereign in the strictest sense of the word. All civil and military officers under the Crown in the United Kingdom were continued in their functions, as has been the law since the reign of Queen Anne, and all officers in the colonies and dependencies, as was enacted in the reign of William IV. The King opened his first Parliament in person on Feb. 14. As provided by the bill of rights, he made the formal Protestant declaration, denouncing the doctrine of transubstantiation, and characterizing as superstitious and idolatrous the adoration of the Virgin Mary and invocation of saints and

the sacrifice of the mass as used in the Church of Rome, solemnly avowing that this declaration is made without equivocation or mental reservation, and without dispensation from the Pope. Various absurdities in ancient laws never repealed came to light in connection with the demise of the Crown. Under the law of Queen Anne, officials were retained for six months only, and ministers were required to seek re-election to Parliament. All come under the operation of the common law of master and servant, by which the contract of service is terminated by the demise of the master so effectually that officials appointed directly by the Crown, such as ambassadors, can not legally claim pay for the time that they have already served. Mr. Labouchere called attention to the anomaly in the House of Commons by saying that he spied strangers within the bar, designating the First Lord of the Treasury. Mr. Lowther, who temporarily occupied the chair, thought it was a point for courts of law to decide. The common law of master and servant does not apply to civil servants, because they receive their appointments from the ministry, nor to officers of the navy, because their commissions are not made out by the Crown; but it does to officers of the army, and it applies without any qualification in the British protectorates, where continuity of administration is peculiarly important. In practice the law has been disregarded. To bring the law into harmony with custom the Attorney-General drew up a bill providing that the holding of office under the Crown, whether within or without British dominions, shall not be affected, nor shall any reappointment be necessary by the demise of the Crown. The law was made to take effect from the last demise of the Crown. The ministers wished to bring in no debatable matter, and therefore left untouched the anomalies and uncertainties of the law as regards the vacation of seats in the House of Commons on appointment to offices under the Crown. On appointment to certain offices members must give up their seats in ordinary times, but they can go from one office to another and still hold them. Some members of Parliament defended the right of constituencies to express their opinion upon the acceptance of office by their representatives. The declaration against Roman Catholicism, originally framed under the influence of the Guy Fawkes scare, which the King would have to repeat in his coronation oath, was a more serious matter. It was regarded by Roman Catholics as offensive. Lord Herries moved in the House of Lords that a committee be appointed to consider and report upon the royal declaration. The Prime Minister, deploring the indecent violence of language in which the oath was formulated, consented to a joint committee of both houses, with the proviso that no modification of the oath should be considered that would diminish its efficacy as a security for the maintenance of the Protestant succession. Lord Portsmouth wished the denunciation of the doctrine of transubstantiation to be retained because it had invaded the Church of England. The question was widely discussed in the press and in meetings, and gave rise to much feeling. The committee reported in favor of expunging the words which describe the mass as superstitious and idolatrous. Roman Catholics objected to the reference to the adoration of the Virgin, because they do not adore the Virgin. Low Churchmen and Dissenters generally resisted any alteration in the declaration. Lord Grey and many other Protestant politicians were willing to abolish it altogether, as even in its modified form it was a gratuitous insult to 12,000,000 loyal British sub-

jects. The Archbishop of Canterbury complained that there were no bishops on the committee, and wanted the report sent back to the committee with some bishops added to it. The proposed new form in which the Roman Catholic doctrines mentioned are declared to be contrary to the Protestant religion was ridiculed by Earl Grey because the Pope himself might subscribe to such a truism. The law excludes Roman Catholics from the throne, and the real guarantee for the Protestant succession was held to be the determination of the people of the country not to permit the ascendancy of a foreign organization; still an oath was considered necessary by most Englishmen as a test by which the title of any given candidate for the succession must be established or invalidated. The form finally embodied in the bill that was presented in the House of Lords by the Government left out the reference to Mariolatry to which Roman Catholic peers objected, and added the words "in which I believe" after the words "are contrary to the Protestant religion." The Catholics still were not contented, while among the Protestants of the stricter sects an agitation was kindled that was ominous for the fate of the bill in the House of Commons; therefore the Government dropped it after it had passed the Lords. A royal titles act, introduced after consultation with the Governments of the colonies, gave authority to the King to alter the royal style and titles as might seem fit with a view to the recognition of the British dominions beyond the seas. The form proposed to be assumed by the new sovereign is Edward VII, by the Grace of God of the United Kingdom of Great Britain and Ireland and of all the British Dominions beyond the Seas King, Defender of the Faith, Emperor of India. Whether the title Defender of the Faith shall be retained was a question to be considered. It was conferred by Pope Leo X on Henry VIII, who wrote a book to refute Luther, and when the same monarch was subsequently excommunicated and declared infamous by Paul III this title was not expressly revoked. It was adopted by Elizabeth, and has been borne by all the Protestant British monarchs.

In the speech from the throne the Government measures promised were one for increasing the efficiency of the military forces, one changing the constitution of the Court of Final Appeal in consequence of the increased resort to it, resulting from the expansion of the empire during the last two generations, one amending the law of education; and if time allowed, legislation for regulating the voluntary sale by landlords to occupying tenants in Ireland, for amending and consolidating the factory and workshops acts, for improving the administration of the law respecting lunatics, for amending the public health acts respecting lunatics, for amending the public health acts in regard to water-supply, for the prevention of drunkenness in licensed houses or public places, and for amending the law of literary copyright. The war in South Africa was said to be not entirely terminated, but measures had been taken to enable the troops to deal effectually with the forces by which they were still opposed; the fruitless guerrilla warfare of the Boer partizans entailed a regrettable loss of life and expenditure of treasure, and until they submitted it would be impossible to establish in those colonies institutions which will secure equal rights to all the white inhabitants and protection and justice to the native population. Credit was given to the Indian troops and the British naval forces for having largely contributed to the release of the

besieged in the Legations at Peking. The opening of the first Parliament of the Commonwealth of Australia by the Duke of Cornwall was mentioned, and his intended visit to New Zealand and Canada. The raising of fresh contingents for South Africa by Canada and the Australasian colonies, the success of the Ashanti expedition, and the alleviation of the suffering and mortality caused by drought in India through a seasonable rainfall were noted as subjects for rejoicing. Care had been taken to limit expenditure, yet the naval and military requirements of the country and the South African war necessitated an inevitable increase in the estimates. The demise of the Crown rendered necessary a renewed provision for the civil list, the King placing unreservedly at the disposal of Parliament the hereditary revenues of the Crown that had been so placed by his predecessor. In referring to the death of the late Queen at the opening of the speech, the new monarch pledged himself to walk in her footsteps. The Government having been strengthened by its renewed mandate from the people and possessing an overwhelming majority, while the Opposition was divided on the war policy and disorganized, ministers were careless, and their party lacked discipline to such an extent that the ministerial majority frequently sank to a perilously low point, and on an important amendment to the factory bill the ministry was actually defeated. The Radicals and the Irish Nationalists, whose alliance had been avowedly dissolved, were encouraged by this circumstance to join forces again and to attack the Government on its conduct of the war and its failure to make peace. Acrimonious debates on these subjects took up most of the time of Parliament, though when the house divided on these questions a large section of the regular Opposition voted with the Government. Sir Henry Campbell-Bannerman insisted that the Government was wrong in demanding unconditional surrender, that the Boer leaders would accept terms proper to be offered to freemen. The burning of farms as a military measure was denounced by Liberals in general. Mr. Dillon's motion condemning the conduct of the war as disgraceful and dishonoring to a nation professing to be Christian was not approved by Liberals, and mustered only 91 votes against 243. Mr. Chamberlain and Mr. Balfour took a firm stand against granting the least shred of independence to the Boers, though whenever they laid down their arms they should be leniently treated. Besides farm-burning, the destruction of all stock and stores accessible to the Boers, the employment of armed natives, the executions for treason, the suspension of constitutional rights in Cape Colony, the threats of retaliation against the enemy still in the field, and above all the concentration of Boer non-combatants in camps of detention, were vigorously denounced, yet Mr. Lloyd-George's motion protesting against the concentration camps obtained only 134 votes against 253. Mr. Redmond hoped that the Boers would be strengthened in their resistance until they separated South Africa from the empire that deluged it in blood. The conciliation of those in the field was the means to bring the war to an end that Sir Henry Campbell-Bannerman, the nominal leader of the Opposition, proposed, and Mr. Chamberlain was held responsible for the failure of negotiations with Botha. The futile proclamation announcing that Boers who did not surrender before Sept. 15 would have their property confiscated and be banished was shown by Sir William Vernon Harcourt to be contrary to public law, yet Mr. Asquith approved the contention of Mr. Chamberlain that the Boer

fighters were to be treated as bandits. The division in the Liberal ranks resulted in the formation of the separate faction of Liberal Imperialists, led by Mr. Asquith, who was Sir Henry Campbell-Bannerman's deputy in the leadership of the main party, and who was supported in his revolt by Sir Edward Grey and Sir Henry Fowler. The differences of the two sections could not be composed, and the return from his retirement of Lord Rosebery to the leadership of the whole party seemed the likely outcome when the Boer resistance should be finally broken and the period of reconstruction in South Africa at hand. A grant of £100,000 to Lord Roberts was opposed by few except the Irish compatriots of the distinguished soldier. The King's civil list was fixed at £470,000 a year, with an annual allowance of £70,000 to the Queen if she should survive her husband, and payments calculated according to previous precedents to the Duke of Cornwall and York and the King's daughters, no account being taken of the revenues received by the King from the Duchy of Lancaster and by the heir apparent from the Duchy of Cornwall. Mr. Labouchere, Mr. Keir Hardie, and the Irish Nationalist leaders mustered 60 votes against this provision for the royal family.

The financial proposals of the Government, army reform, and the condition of the navy were, next to the war, the subjects most discussed. The ordinary expenditure on the army and navy had doubled in ten years, and the expenses in South Africa made it quadruple. The army cost more than any other except the mammoth army of Russia; yet it had been found deficient as a fighting machine, and Mr. Brodrick's reform proposals were regarded as illusory, and the addition of 117,000 men to the former strength of 563,000 as fictitious. Slight and ineffective as the reform seemed to be, the cost of the army amounted to about as much as the naval budget, and the traditional naval policy of the Government suffered a relapse in the stress of the military perplexity. Mr. Winston Churchill took up the note of warning that his father, Lord Randolph Churchill, had emphasized by the sacrifice of his public career. Experienced statesmen had similar fears, and Mr. Balfour promised that, whatever was done for the army, the navy should not be neglected. In the voting on the finance bill the Cabinet carried the proposal for a loan of £60,000,000 by a majority of 69, the duty of 4s. 2d. a hundredweight on sugar by one of 60, the coal duty by 44 majority. Trifling concessions were made by Sir Michael Hicks-Beach in regard to both the coal and the sugar duty. The Nationalists moved to exempt Ireland from the main provisions of the bill. Mr. Morley and Sir William Harcourt admitted that, since the war was so popular, it was right that the masses should bear their share of its cost. The majority on the third reading of the bill was 170.

The question of establishing a final Court of Appeal for the empire was referred to a colonial conference, the majority of whose members were opposed to any drastic changes in the composition of the existing court, the Judicial Committee of the House of Lords, though they made suggestions for strengthening and improving that tribunal, which form the basis of further consultations with the governments of the colonies.

The question of educational reform was one which the Government could no longer evade, its own carelessness having led to legal complications that must be straightened out. Schemes for improving both primary and secondary education have been put forward in every succeeding session

of Parliament, but the Conservative Government, having resigned the matter largely into the hands of the clergy at the outset, was unwilling to acknowledge responsibility. A judgment of the courts in the Cockerton case showed that the school boards had illegally invaded the domain of secondary education, making legislation necessary. The decision was that school boards can not employ funds derived from the school rates for giving instruction that is not elementary, or instruction to persons who are not children. Sir John Gorst introduced a makeshift bill, disappointing and inadequate, which was finally abandoned on the ground that there was not sufficient time to pass it through all the stages. The principle was affirmed that in secondary education the school boards, elected on narrow local or sectional issues, were not fitted to exercise the controlling authority, which should be entrusted rather to a body selected for general intelligence and administrative capacity on some such basis as the county councils are selected. The Liberal Opposition, urged by their Non-conformist supporters and stimulated by a popular agitation, protested against such a principle, and championed the claims of the school boards. The Government brought in a second bill of a single clause, and under the ten-minute rule pressed it through, in spite of the objections of the Opposition and a minority of its own party. The bill gives to county and borough councils control of schools in which science and art are taught beyond the elementary grades and of evening and continuation schools for pupils over fifteen years of age, and legalizes for a year the continuation of the existing schools and their support out of school rates by agreement between school boards and the councils. A bill authorizing the laying of a Pacific cable in cooperation with the colonies was passed in the teeth of vigorous Irish opposition. The agricultural rating act was renewed, but in deference to the Liberals its duration was limited to four years. A new act regulating factories and workshops was passed, in which the ministers were compelled by an adverse vote to change the hour for closing on Saturdays from one to twelve o'clock, and by threats of Irish resistance to leave out an important clause affecting laundries, because Mr. Ritchie proposed to bring under the operation of the factory act laundries conducted by religious societies for charitable purposes as well as ordinary laundries. The two-shift clause, on which the previous bill was wrecked, was omitted, also a clause dealing with overtime in certain trades. Dangerous trades are to be determined by the Government without arbitration. A beer bill was introduced by a private member in consequence of the popular alarm caused by the fatal poisoning of nearly 100 persons in Manchester by beer containing arsenic. This arsenic was traced to the sulfuric acid used in the preparation of glucose, one of the constituents of light beer made from rice. The friends of British agriculture asked for a measure prohibiting brewers from using any materials other than malt and hops. It was argued on the other side that foreign agriculturists would benefit by such a restriction, British barley not being the best for malting purposes, and that the public would be deprived of a beer which suited the taste and the pocket of the multitude, and which by a proper inspection of its materials could be rendered as safe and wholesome as that brewed from malt and hops alone. The Government bill did not prohibit the use of substitutes, but provided that beer made from barley, hops, and yeast shall be served when customers call for malt beer, and

that all other kinds shall be sold as part malt beer; but hop substitutes, being innocuous and difficult to detect, are prohibited. To please the Protectionists of the school of Mr. Chaplin, who would be glad to have the corn duties reimposed, the Government ordered that only British beef should be supplied to the army in Great Britain, an order that could have no appreciable effect on American beef exports. The Irish, although active and aggressive, extracted no legislation from the Government. Mr. Balfour expressed approval of the project for an Irish Catholic university, and a royal commission was appointed to inquire into the state of higher education in Ireland outside of Trinity College. A new Irish member drew attention to the Irish language question by attempting to address the House in Erse until he was checked by the Speaker. Subsequently Mr. Wyndham referred sympathetically to the aims and efforts of Irishmen to revive and cultivate their ancient language. He brought upon himself, however, the reproaches of the Irish party when the Government seized Mr. O'Brien's Dublin newspaper for libeling the King and broke up Irish Land League meetings in Sligo and other parts of the country. A resolution was offered for the purchase of Irish railroads by the state. Mr. Redmond obtained 140 votes for a motion in favor of the compulsory sale of lands in Ireland. The Irish members contended that Ireland should not be compelled to contribute money for a military system she abhorred, and Mr. Claney's motion to that effect obtained 102 votes. When Irish members refused to vote on the education estimates in which Ireland had no interest they were named by the Speaker and removed by the police. A rule was subsequently adopted suspending for the remainder of the session any member whose refusal to obey the Speaker's order to withdraw is carried so far that it would necessitate a resort to force. Another new rule enables the Government to carry in batches votes in supply that remain outstanding after the expiration of the allotted days. The Irish members forced upon the house two controversies with newspapers for breach of privilege. On the last day of the session a London editor who had charged the Secretary for War with partiality in the communication of news was called before the bar to apologize.

The trial before the House of Lords of Earl Russell for bigamy was an antiquated pageant which served to call attention to the senselessness of the surviving privileges of the nobility. The deceased wife's sister bill was read a second time by a majority of 279 to 122, but went no further. Other measures offered by private members, such as a cremation bill, met with a similar fate. Mr. Pirie carried through a Scotch education bill that was approved by the leaders on both sides of the house. The pure bill was read a second time by a large majority, and then turned over to a standing committee. Mr. Strachey's outdoor relief bill passed through the Commons, but was rejected in the Lords for financial reasons. The Bishop of Winchester offered a licensing bill which the Government changed materially and let fall after carrying it through the House of Lords. The bill as amended provided that any person convicted as a habitual drunkard who attempts within three years of such conviction to purchase intoxicating liquor should be liable to a fine of 20s. in the first instance and 40s. afterward, and a licenseholder knowingly allowing intoxicants to be sold to such a person to a fine of £10 for the first and £20 for each subsequent offense; that any one found drunk in charge of a child shall pay

208.; that drunkenness either of a husband or a wife is ground for separation. Another bill was intended to prevent evasions of the law prohibiting the sale of drink during certain hours on Sunday except to travelers. The bill proposed that only certain selected houses should have the privilege to sell to travelers, paying an extra license fee therefor, and that no traveler should be served within 6 miles from his home, instead of 3 miles as before, and if traveling by rail, not within 25 miles. The bill forbidding the sale of liquors to children was not sacrificed with other incomplete legislation, and was finally passed after it had been greatly altered by the standing committee. Any license-holder who serves intoxicating liquor to a child apparently under the age of sixteen years for consumption either on or off the premises is liable to penalties. The act is designed to save children from the contamination to which they are exposed when sent to fetch beer or other liquor from public-houses. The law relating to youthful offenders was amended in such a manner as to prevent the imprisonment of very young children.

Parliament was prorogued on Aug. 17. In the King's speech the conquest of the South African republics was said to have progressed steadily and continuously, although the difficulty and extent of the country had caused military operations to be protracted. The barrenness of the session in legislative results was excused on the plea that the attention of Parliament had been taken up by the provisions made necessary by the special circumstances of the year—the demise of the Crown, the continuance of an arduous war, and the necessity of raising fresh revenue by a wider range of taxation. While providing for the heavy expenditure of the war, Parliament had further made provision for the increase in many important respects of the efficiency of the naval and military forces of the empire. The emergency education bill, vesting in local authorities the superintendence of important departments of education, was described as a measure intended to prepare the way for further reforms, as was understood by the Liberals when they wished the authority conferred by the bill to be vested in the Education Department, and defended the school boards against the depreciatory strictures of Sir John Gorst. Of about 300 bills submitted to Parliament only 40 became law, a third fewer than the average for ten years, fewer than in any session of recent times. Except the sale of liquor to children act and the Scotch education act the only act of a private member that went through was Lord Windsor's libraries act.

Dependencies.—British colonies are of three principal classes, the Crown colonies, in which the Government is exercised by imperial officers instructed from the Colonial Office in London; colonies possessing representative institutions, in which the home Government retains the control of the executive; and colonies having responsible government in which the right of veto over legislation remains vested in the Crown, but is exercised only for urgent imperial reasons. The imperial Government expends about £2,000,000 a year on the colonies, mainly for the maintenance of naval defenses and military garrisons. The military forces maintained in the colonies in 1900 comprised 60,079 men, of whom 5,450 were stationed at Gibraltar, 10,817 in Malta, 135 in Cyprus, 15,514 in Cape Colony and Natal, 3,576 in Mauritius, 723 in St. Helena, 1,871 in Sierra Leone, 1,782 at Halifax, 320 at Esquimaux, 3,067 in Bermuda, 1,778 in Jamaica, 1,538 in Barbados and St. Lucia, 1,778 in Ceylon, 1,794 in the Straits

Settlements, 3,494 at Hong-Kong, 1,279 at Wei-Hai-Wei, and 1,130 elsewhere, not including 4,411 in Egypt and the British army in India, numbering 73,484 officers and men. Ceylon, in the year ending March 31, 1901, contributed £123,800, Mauritius £22,200, Hong-Kong £51,600, the Straits Settlements £87,200, Malta £5,000, and Natal £4,000 in aid of imperial military expenditure, while the West African colonies gave £10,000 for military expeditions, and Canada £10,000 for military expeditions and £21,000 for the Esquimaux fortress.

Gibraltar is a Crown colony and a military and naval fortress at the entrance of the Mediterranean, over which a military officer is invariably appointed Governor, Sir George Stewart White in 1901. The revenue in 1899 was £59,954; expenditure, £59,520. The tonnage of vessels entered in 1898 was 4,328,859, of which 3,241,492 tons were British. A naval dockyard is being constructed, enclosed by three moles, with two or three new graving docks, 850 feet, 550 feet, and 450 feet in length, and a deep harbor 260 acres in extent. The works were begun in 1893, and in 1896, when Mr. Goschen had succeeded Earl Spencer as First Lord of the Admiralty, the plan was extended so as to include large workshops and a set of storehouses, the whole to cost £4,500,000. The moles have been completed, one of the docks also, one of the other docks was far advanced, and the workshops were nearly done when the work, except the parts already contracted for, was stopped early in 1901. Thomas Gibson Bowles had pointed out in Parliament that modern siege-guns posted on the neighboring heights could destroy everything. The Earl of Selbourne, First Lord of the Admiralty, appointed a committee in which Mr. Bowles was associated with the naval and military commanders and an eminent engineer. This committee reported in favor of a harbor on the eastern side of the rock, enclosed within two moles nearly half a mile long, sheltered from the Mediterranean storms by a heavy sea mole of three times their length, connected by a tunnel through the Rock with the western harbor, which would not be abandoned, but used in peace time as far as it was completed or so near completion that it would be better to carry it out, stores and munitions for war to be kept in chambers excavated from the tunnel, and the coal supply in the eastern harbor, which should have a graving dock of capacity adapted to the heaviest battleship at the maximum draught at which she could float after severe damage in action, with workshops and storehouses equal to any demands. This harbor is estimated to cost £5,200,000, and it can not be built in less than ten years, because the sea is so rough that work can go on only half the time. It is less exposed to land fire, though more open to attack from the sea. It is doubtful whether the sea mole can be built so as to last, or even built at all. If it takes too long, the second dock on the western side will be carried to completion, as it is better to have a dock with risks than no dock at all. The discussion alarmed the Spanish Government, which feared that England might covet the neighboring heights commanding the costly unfinished harbor. The Spanish military authorities took measures to guard against a surprise. Even if the docks on either side of the Rock are not available in war time, they will contribute to the successful termination of a war by the aid they give during peace to the efficiency of the Mediterranean and Channel squadrons.

Cyprus is Turkish territory administered by Great Britain under a convention. The High

Commissioner is Sir William F. Haynes Smith. The area of the island is 3,584 square miles, with 209,286 inhabitants, of whom 47,926 are Mohammedans and the rest Orthodox Greeks. The revenue in 1900 was £200,638, and expenditure £134,682. The only debt is an advance of £314,000 made by the British Government in 1899 for railroads and harbor and irrigation works. The products are wheat, barley, olives, wine, cotton, carobs, silk, linseed, cheese, wool, and hides. The imports in 1900 were valued at £289,962, and exports at £264,851. Of the revenue £54,221 were derived from tithes, £35,662 from the property tax, £30,571 from customs, and £28,300 from excise. Of the expenditures the heaviest items were for police and public works. Since the British occupation revenue has exceeded expenditure, but the surplus and over £700,000 more contributed by the British Government was required to pay the Turkish tribute of £92,799 and 4,000,000 okes of salt. Live animals and foodstuffs constitute two-thirds of the exports, which go to Great Britain, Turkey, Egypt, and France, while the two former supply the bulk of the imports. The product of wheat in 1900 was 1,500,000 bushels; of barley, 2,000,000 bushels; of wine, 3,750,000 gallons, of which 1,250,000 gallons were exported; of brandy, 241,000 gallons.

Malta has been the base for the repair and refitment of vessels of the British Mediterranean squadron, but much of this work has been transferred to Gibraltar. The island has an area of 117 square miles. The revenue in 1899 was £354,265; expenditure, £351,354. The Governor in the beginning of 1901 was Lieut.-Gen. Sir Francis Wallace Grenfell. He was succeeded by Lord Congleton. Cotton, oranges, figs, and honey are the chief products, and there are manufactures of matches, cotton goods, and filigree work. The number of vessels entered in 1899 was 3,560, of 3,297,712 tons; cleared, 3,560, of 3,292,942 tons. Parliament voted £1,000,000 in 1901 under the provision for naval and military works to build a needed breakwater. Malta has been a British colony over a hundred years. The people voluntarily accepted British sovereignty, and have always claimed the right of self-rule, which England has not admitted, the island being primarily a naval and military station. In 1887 a Constitution was conferred which gives to a limited class, estimated at 10 per cent. of the population, the right to elect members to the Council of Government, which has control over expenditures. The elected members having refused to agree to new taxes which the British Government decided to impose in Malta, the taxes were decreed by an order in Council. This angered the people of Malta, who protested that they could pay no higher taxes, their former wealth having decayed under the military government, which was constantly becoming harsher and more grinding. An order in Council substituting the English language for the Italian as the official language of the country stirred up a deeper and more universal feeling of resentment and indignation. In meetings held on May 5 and June 2, 1901, the people of all classes showed a unanimous sentiment, both against the imposition of new taxes so long as Malta is deprived of the right of self-rule in local affairs and against the abolition of Italian as the language of government and of the courts. Malta, it was contended, on the occasion of its self-cession, received from the King of England a solemn promise that the rights of the Maltese would always be respected, and among these rights the maintenance of the Italian language in its ancient position was considered to be one of the most

vital. The change of the official language has been in contemplation for some years. In 1899 a deputation was sent to London to protest against the substitution of English for Italian, which was coupled in the minds of the people with a supposed plan to wean them from the Roman Catholic faith and make Protestants of them. They were greatly agitated in 1896 by a decree legalizing mixed marriages and marriages by Protestant clergymen, against which the Holy See protested. The native clergy were greatly incensed at the adoption of English as the official language, which will not go into full effect till after the end of fifteen years, and all the educated class, who use the Tuscan tongue, resisted the change with equal heat and earnestness, and to the astonishment of the English the common people were not less wrought up about the matter. It was expected that the poorer classes, who speak Maltese, a mixed patois which is not exactly Italian, which the English are prone to believe is rather a variety of Arabic, would welcome a change that would wipe out one of the social distinctions between them and the aristocracy. They are so eager to learn English, which in trade at home and when they seek their fortunes in foreign countries is more useful to them now, that in the schools, in which they choose what foreign language they will take, 97 take English where 3 select Italian. In 1899, when an English officer, Col. Hewson, brought the question to a test by refusing to sign depositions written in Italian on the ground that he did not understand the language and was consequently sent to jail for contempt of court, Mr. Chamberlain announced the decision of the Government to make the English language optional in all the courts, and to insist that summonses, warrants, and the like served on English-speaking persons should be written in English as well as Italian. An order in Council gave British subjects not born or naturalized in Malta a right to use the English language in proceedings against them. In 1901 an order in Council announced the abolition of Italian as the official language and the sole use of English after a fixed period. When mass-meetings were held and petitions were addressed to the British sovereign, Government, Parliament, and people, and all the Maltese seemed to be of one mind and to regard what the Foreign Office represented to be a reform as a blow at the existence of the Maltese as a distinct people, Mr. Chamberlain supposed that they were misled by the false representations of aristocratic ringleaders who desired only to preserve the ascendancy of their caste. The elected members of the Council of Government, acting in conjunction with a national committee that had been formed, framed a petition to the King on Aug. 8 protesting against the additional taxation that Mr. Chamberlain had announced on July 30. Two days later a popular demonstration took place in which the British flag was torn down and police and soldiers were called out to curb the excesses of the multitude. The elected members of the Council refused to sanction the expenditure of any public money if the Maltese were to be taxed without representation, and to have English foisted on them in the place of their own official language. Mr. Chamberlain had gone so far that he was unwilling to recede, and saw no solution of the deadlock except to legislate for the colony by means of orders in Council. If the elected members of the local Government should persist in their attitude, he suggested the abrogation of the Constitution of 1887.

Aden, the chief coaling station on the Suez

Canal route to India, is a volcanic peninsula, 75 square miles in extent, while the island of Perim has an area of 5 square miles. The Political Resident at the head of the Government is commander of the garrison. The imports in 1900 were 38,099,806 rupees by sea and 2,750,444 rupees by land, besides 3,414,306 rupees of precious metals; exports, 30,460,258 rupees by sea and 1,140,755 rupees by land, besides 3,643,502 rupees of precious metals. The port was visited during 1900 by 1,224 merchant steamers, of 2,467,665 tons, and 1,687 native vessels, of 52,906 tons. The exports are coffee, gums, hides and skins, and tobacco, the produce of Arabia and the coast of Africa. Attached to Aden are the protected island of *Socotra* and the *Kuria Muria Islands*. Socotra has an area of 1,382 square miles, and produces dates, gums of various kinds, and butter. The *Bahrein Islands* are a British protectorate under a native sheik, from which pearls were exported of the value of £454,962 in 1899, the total value of exports being £654,238, and of imports £641,506.

British Borneo has an area of 31,106 square miles, with about 175,000 inhabitants. The Governor, Edward Woodford Birch in 1901, administers the country for the British North Borneo Company, and has jurisdiction over the island of *Labuan* and the recently annexed territory of *Tambunan*. The native sultanates of *Brunei* and *Sarawak* have also been taken under British protection. Tobacco of the Sumatra variety has been extensively planted in North Borneo, and there are numerous coffee plantations, besides a considerable and increasing number of pepper, coconut, hemp, and gambier plantations. The revenue in 1899 was £542,919; expenditure, £410,290; exports, £3,439,560; imports, £2,456,998. The imports of the sultanate of Sarawak were £3,281,609, and exports £4,476,006. The state of Sarawak, which has an area of about 50,000 square miles, and a population of 500,000 Melanaus, Malays, Dyaks, Kayans, Kenyahs, Muruts, and Chinese and other immigrants, is ruled by the Rajah Sir Charles Johnson Brooke, nephew of Sir James Brooke, who received a cession of the country from the Sultan of Brunei in 1842. Coal exists in large quantities, and gold, silver, antimony, and cinnabar are mined by the Chinese. There are valuable diamond-mines which by agreement with the De Beers Company of Kimberley have remained unproductive. The military force consists of 250 Dyaks under a British officer. The revenue, derived from opium, gambling, and arrack farms, exemption taxes from Malays and Dyaks, taxes collected from the Kayans, and import and export duties, amounted in 1900 to £915,966, having more than doubled in ten years, while trade has trebled. The imports amounted to £615,912, and exports to £686,586. The chief exports are pepper, sago, gutta-percha, gold, gambier, dried fish, and rubber. Sago is made into flour by Chinese in factories at Kuching and exported thence to Singapore. Timber is exported to China. Chinese settlers cultivate pepper, gambier, and sago. The native tribes raise rice and collect jungle produce. The Dyaks go all over Borneo and to Sumatra and the Federated Malay States in search of gutta-percha, which is growing scarce. The Melanaus have forests of sago-palms, which they preserve and cultivate. The Malays are the sailors and fishermen and the carpenters. Other trades are followed by the Chinese, who are also the merchants and the laborers on the plantations and in the mines. Tamils have lately been attracted to this country. Chinese colonies for the cultivation of rice have been planted with Government aid. Chinese capitalists of the Straits Set-

tlements are seeking investments in Sarawak, and Chinese merchants contemplate a line of steamers to Hong-Kong.

Ceylon has a legislative body in which the various races are represented. The Governor in 1901 was Sir Joseph West Ridgeway. The island has an area of 25,333 square miles and a population estimated in 1899 at 3,477,094. The tea plantations are cultivated by the labor of Tamils imported from the south of India. The revenue in 1899 was 25,913,141 rupees; expenditure, 24,952,460 rupees. The public debt was £3,445,839, raised for the railroads, 297 miles in length, and for the break-water and water-works at Colombo. The area planted to tea in 1898 was 424,856 acres, while 19,023 acres were planted to coffee, 864,296 to coconuts, 46,117 to cinnamon, 33,260 to cacao, 11,127 to tobacco, and 753,872 to rice and grain. The value of imports in 1899 was 111,992,349 rupees, and of exports 111,955,937 rupees. The exports of tea were 51,864,763 rupees in value; of plumbago, 22,255,400 rupees; of coconut kernels and fiber, 14,353,403 rupees. The tonnage entered and cleared in 1899 was 7,439,205. The *Maldiv Islands*, having a population of 30,000 Mohammedans, who are sailors and traders, are tributary to the Ceylon Government. The total population of Ceylon at the census of March 31, 1901, was 3,576,990, including 3,360 military, 4,104 seamen, and 4,913 prisoners of war. The coolie immigrants employed on estates increased from 262,262 in 1891 to 441,523 in 1901. The public expenditure of Ceylon, chiefly from loans, has recently been very heavy, 12,750,000 rupees being estimated for the financial year 1902 on the harbor works and graving dock at Colombo, three lines of railway, and irrigation works, all of which are expected to be completed by 1904. Drainage works and water-supply for Colombo are next to be taken in hand, and a railroad will be built from Colombo through a rich native cinnamon and coconut district to Chilaw. Attention is being given to the pearl oyster fisheries on the northern coast with a view to preserving and cultivating the oysters. The restriction of tea shipments from both India and Ceylon has had the effect of improving prices in the London market. Arabi Pasha and Ali Fehmy, the last of the Egyptian leaders who were exiled to Ceylon in 1883, departed in the summer of 1901. There were then already over 5,000 Boer prisoners confined in the camp at Diyatalawa. The depression in the price of tea has caused more attention to be given to other products. There were in 1901 under tea 393,000 acres; under cacao, 24,000 acres; under cardamoms, 7,000 acres; under rubber, 2,500 acres. Some cinchona was also planted. Coffee, which once covered 272,000 acres, occupied only 8,000 acres. The great native industries in coconut and other palms, cinnamon, and citronella grass take up a great area, and the Government is extending rice cultivation by restoring old irrigation works and constructing new ones. The population increased in ten years 19.4 per cent. The population of Colombo in 1901 was 154,279. The permanent population of the island, excluding soldiers, seamen, and prisoners, was 3,564,613, comprising 1,460,990 Singhalese, 873,580 Kandians, 950,844 Tamils, including immigrants, 224,066 Moormen, or Mohammedans, 11,242 Malays, 23,256 Burghers and Eurasians, 6,374 Europeans, and 14,264 others.

Hong-Kong, ceded to Great Britain by China in 1841, is the distributing point for British commerce with the far East. The Governor in 1901 was Sir Henry A. Blake. The area of the island is 29 square miles; population, 221,441, mainly

Chinese. The ordinary revenue in 1899 was £2,865,759; expenditure, £3,031,131. The public debt is £341,800, incurred for water-works, sanitation, and fortifications. The number of vessels entered during 1899 was 5,444, of 6,720,769 tons, exclusive of 22,566 junks, of 1,849,435 tons.

The *Straits Settlements* are a Crown colony, and the Governor, Sir Frederick Cardew in 1901, is also High Commissioner for the Federated Malay States, in which Sir F. A. Swettenham is Resident-General. The island of Singapore has an area of 206 square miles, besides which the colony includes Penang, Malacca, Province Wellesley, and the Dindings on the coast of the Malay Peninsula. The Federated Malay States under British protection are Perak, Selangor, Pahang, Sungei Ujong, and Negri Sembilan. There were 149,697 Chinese and 18,981 Indian immigrants in 1899. The population of Perak is 214,254; of Selangor, 81,592; of Sungei Ujong, 23,602; of Pahang, 57,462; of Negri Sembilan, 41,617. The revenue of the colony in 1899 was \$5,200,025; expenditure, \$5,061,013. Perak had a revenue of \$6,580,306, and the expenditure was \$5,441,692; Selangor's revenue was \$6,692,330, and the expenditure \$3,414,551; Negri Sembilan, including Sungei Ujong, had \$1,085,015 of revenue, and the expenditure was \$851,704; and the revenue in Pahang was \$375,350, and expenditure \$1,814,030. Rice, tapioca, sugar, and pepper are grown in Province Wellesley and Malacca and in some of the native states, which produce also Liberian coffee and gambier. The export of tin in 1899 from Perak was 18,960 tons; from Selangor, 15,185 tons; from Negri Sembilan, 3,700 tons. Tin is mined also in Pahang, where gold is obtained, and in Negri Sembilan and Perak. The export of gold from Pahang in 1899 was 18,295 ounces. Singapore is a center of trade for the islands of Malaysia as well as of the peninsula. The exports, besides tin, sugar, coffee, and pepper, include nutmegs, mace, sago, rice, tapioca, buffalo hides, rattan, gutta-percha, tobacco, gambier, India-rubber, copra, gums, and dyestuffs. The value of imports in 1899 was \$283,939,452; of exports, \$239,054,727. The chief imports, which were largely reexported, were rice of the value of \$22,666,810; cotton cloth, \$13,052,117; opium, \$12,142,831; fish, \$6,864,684; coal, \$5,955,577; tobacco, \$4,452,815; petroleum, \$2,393,442; tin, \$55,225,453; spices, \$13,657,479; gambier, \$5,542,938; gums, \$16,149,762; sago and tapioca, \$6,754,749; rattan, \$4,441,770; copra, \$6,904,420. The number of vessels entered during 1899 was 8,624, of 6,595,075 tons, not including 15,466 native vessels, of 598,195 tons; the number cleared was 8,635, of 6,591,935 tons, besides 15,653 native vessels, of 609,705 tons. The Mexican silver dollar was declared the legal standard of value for the colony by an order in Council issued on Feb. 2, 1895. The British dollar and the Hong-Kong dollar are legal tender. The commerce of the native state of Perak in 1899 was \$11,615,260 for imports and \$25,707,051 for exports; of Selangor, \$18,008,485 for imports and \$20,894,185 for exports; of Negri Sembilan, \$8,840,000 for both imports and exports; of Pahang, \$1,531,661 for imports and \$2,062,241 for exports. The immigration of Chinese in 1900 was 200,947, and of Indians 41,707, but the supply of labor is still below the demand. With the increase of trade the cost of living has risen enormously. Many Chinamen have made fortunes out of tin. The Government of the Straits Settlements revenue has increased, the opium and other monopolies having been let out at greatly increased rates. The revenue in 1900 was \$5,386,927, and the expenditure was \$6,037,084, the excess being due to

the Singapore and Kranji Railroad and the Penang pier that the Government is building. In spite of the wealth existing there, Singapore is one of the most backward cities in Asia. The Germans, who have increased their shipping in the East at a rapid rate, have profited by the growth of trade in the Malay peninsula, and have diverted a part of the trade of Singapore to Malacca. The total trade of the Straits Settlements in 1900 was valued at £28,250,000 for imports and £24,250,000 for exports. The trade of the Federated States reached nearly \$100,000,000 in silver, an increase of \$10,000,000 over the previous year, and exports exceeded imports by \$10,000,000. The revenue of the 4 states exceeded \$15,500,000, the duty on tin yielding \$7,000,000. There are 250 miles of railroad, 1,400 miles of telegraph, and in Perak irrigation works are being constructed at a cost of \$1,000,000 to benefit 60,000 acres. The population of the Federated States is 676,138, an increase of 258,371 in ten years. The supply of alluvial tin will be exhausted some day, and this consideration has prompted the Government to make experiments in planting Arabian coffee, Indian tea, cinchona, pepper, and South American rubber.

Mauritius has a Council of Government, composed of 8 official, 9 nominated, and 10 elected members. The Governor in 1901 was Sir Charles Bruce. The area of the island is 705 square miles, with a population estimated in 1899 at 379,659, containing only a small proportion of white creoles, who are diminishing in number. Besides Africans descended from former slaves or imported since as laborers, and the various mixed races, there were 3,079 Chinese and 261,739 natives of India, the majority of them Hindus, the rest Mohammedans. Port Louis, the capital, containing 52,517 inhabitants, has become an Asiatic town, and the sugar-plantations have been divided into small properties and acquired by Indians. The revenue in 1899 was 9,066,313 rupees, and expenditure 8,407,082 rupees. The debt of the colony was £1,192,184 in 1899. The value of the imports in 1899 was 19,096,212 rupees; exports, 24,745,029 rupees. The export of raw sugar was 23,044,657 rupees; of aloe fiber, 566,030 rupees; of rum, 154,812 rupees; of vanilla, 133,946 rupees. The number of vessels entered during 1899 was 272, of 337,369 tons; cleared, 275, of 339,187 tons.

Many small groups and isolated islands in the Pacific have at various periods been taken under British protection. The *Cook Islands* have been transferred to New Zealand. The *Gilbert Islands*, the *British Solomon Islands*, *Duff Islands*, *Santa Cruz Islands*, *Starbuck Island*, *Malden Island*, *Jarvis Island*, *Fanning Island*, *Palmyra*, *Baker Islands*, *Washington Island*, the *Ellice Islands*, the *Phoenix group*, the *Tokelau group*, *Dudzo Island*, the *Suvaroff Islands*, the *Manihiki group*, and *Ducie Island* are most of them coral atolls, producing coconut-trees in abundance, and some have valuable guano deposits. The recently annexed *Christmas Island*, about 50 square miles in extent, has rich deposits of phosphate which are worked by an English company employing 13 whites and 720 Indian coolies. *Pitcairn Island*, having an area of 2 square miles, is inhabited by 126 descendants of the mutineers of the *Bounty*, who govern themselves by their own Parliament, raise bananas, corn, arrowroot, fruits, coconuts, and poultry and pigs to supply passing vessels, but have little communication with the outside world.

St. Helena is a volcanic island in the south Atlantic, once important as a port of call on the Cape route to the East. Its area is 47 square

miles, and the population is about 4,000. The revenue in 1899 was £11,593; expenditure, £11,432; imports, £91,699; exports £4,592. *Tristan da Cunha, Goughs Island, Inaccessible, and Nightingale Island* are rocky isles in the Atlantic inhabited by descendants of British sailors. *Ascension Island*, northwest of St. Helena, is a coaling station and sanitarium for the war vessels on the west coast of Africa. The *Falkland Islands*, near the Straits of Magellan, have an area of 6,500 square miles and 1,759 inhabitants, British settlers who export wool, hides and skins, and tallow. The revenue in 1899 was £13,219; imports, £73,978; exports, £139,203.

The *Bermudas* are a group of 360 small islands in the north Atlantic, 580 miles east of Cape Hatteras, having a total area of 20 square miles and a population in 1899 of 16,423 persons, of whom 6,282 were whites and the rest colored. The Governor in 1901 was Gen. G. Digby Barker. The revenue for 1899 was £39,955, and expenditure £39,243; imports, £394,388; exports, £119,151, consisting of early onions, potatoes, and tomatoes sent to the American market, and lilies for Easter decoration. The revenue in 1900 was £40,124; expenditure, £47,532; debt £49,000. The imports were £397,136, 63 per cent. coming from the United States and 27 per cent. from Canada; exports, £93,769. About 3,000 Americans visit Bermuda in the winter. On an average 3,000 imperial troops are stationed there. In 1901 many Boer prisoners from South Africa were brought to this colony. The tonnage of vessels entered and cleared in 1900 was 729,832.

British Guiana has a legislative body called the Court of Policy, composed of 7 official and 8 elective members, to which 6 more elective representatives are added to form the combined court, which decides questions of taxation and expenditure. The Governor in 1901 was Sir Walter J. Sendall. The area of the colony is about 120,000 square miles, with a population of 278,328, including 2,533 Europeans, 99,615 Africans, 3,714 Chinese, and 105,463 East Indians. There were 8,500 births and 9,706 deaths in 1898. The revenue in 1899 was £538,838, and expenditure £525,542. The sugar estates occupy only 69,814 acres, and very little other land is cultivated. The gold-mines produced 112,464 ounces in 1899, and 112,823 ounces in 1900, against 125,080 ounces in 1898 and 126,702 ounces in 1897. The value of imports in 1900 was £1,318,701; exports, £1,927,960. Steam dredging for gold has been begun on the Barima river, and if successful will be attempted on the Cuyuni and other rivers. The output of gold in the year ending June 30, 1901, was 109,207 ounces. There were 15,563 laborers employed in the gold-mines. Diamond mining was begun in 1900, mainly in the Mazarini fields, which are more extensive than was first supposed, the diamonds occurring under similar conditions to the Brazilian deposits. The planters are opposed to the development of the interior, fearing that it will draw coolies away from the coast. Jute and rice are new industries. Ochre and cement are being developed. The forests are full of valuable timber. Sugar, the only product cultivated for export, does not occupy more than 70,000 acres, and the whole cultivated area is only 352,000 acres, not a sixtieth of the fertile area.

British Honduras has an area of 7,562 square miles and 35,226 inhabitants, of whom 501 are whites and the rest negroes and colored. The Governor in 1901 was Col. Sir David Wilson. The revenue in 1899 was £51,535, and expenditure £53,994. The value of imports in 1899 was £212,237, and of exports £263,090. The export of ma-

hogany was 6,499,168 feet; of logwood, 24,098 tons. Bananas, plantains, and coconuts are shipped to New Orleans. Some coffee is grown, and there is a transit trade in vanilla, rubber, coffee, and sarsaparilla. United States gold was adopted as the money standard in 1864, but the currency in circulation is mostly Government notes and silver.

The principal colonies and dependencies of the British Empire are elsewhere described (see AUSTRALASIA, CANADA, EAST AFRICA, INDIA, NEWFOUNDLAND, SOUTH AFRICA, WEST AFRICA, WEST INDIES).

GREECE, a monarchy in southeastern Europe. The legislative authority is vested in a single chamber called the Boule, composed of 207 members elected for four years by universal adult male suffrage. The reigning King is Georgios I, born Dec. 24, 1845, second son of King Christian of Denmark, elected King of the Hellenes on March 18, 1868, after the deposition of King Otto, with the approval of the protecting powers—England, France, and Russia. The heir apparent is Konstantinos, Duke of Sparta, the eldest son of the King and Queen Olga, daughter of the Russian Grand Duke Constantine, born Aug. 2, 1868, who married the Princess Sophia of Prussia, sister of the Emperor Wilhelm II. The Cabinet first constituted on April 14, 1899, was composed in the beginning of 1901 as follows: President of the Council and Minister of the Interior, G. N. Theotokis; Minister of Foreign Affairs, Athos Romanos; Minister of Worship and Education, S. B. Stais; Minister of War, Col. Nicolas Tsamados; Minister of Marine, Basil Boudouris; Minister of Justice, N. Karapavlos; Minister of Finance, A. N. Simopoulos.

Area and Population.—The area of the Hellenic Kingdom is 25,014 square miles, with a population of 2,433,806. Including the Greeks of the Turkish Empire, estimated at 4,000,000 in European Turkey, 2,000,000 in Asia Minor, and 550,000 in Crete, Cyprus, Samos, and other islands, the people of Greek nationality are believed to number about 8,750,000.

Finances.—The mediating powers which arranged peace between Greece and Turkey guaranteed a loan of 170,000,000 drachmas, exacting as the condition that the revenues from the salt, petroleum, matches, playing-cards, and other monopolies, the tobacco duty, the stamp-duty, and the import duties of the port of Piræus, should be assigned for the payment of interest on the external debt to an international commission consisting of representatives of Germany, Austria-Hungary, France, Great Britain, Italy, and Russia. Out of the loan a war indemnity of 93,930,000 drachmas was paid to Turkey, 31,350,000 drachmas were applied to the redemption of the floating gold debt, 2,440,000 drachmas went to settle other obligations, and 21,960,000 drachmas were given to the Government to meet the deficit of 1897, leaving about 20,000,000 drachmas available for balancing succeeding budgets. The revenue in 1897 was 98,461,708 drachmas, and the expenditure was 137,050,965 drachmas. In 1898 the revenue was stated approximately to be 107,085,658 drachmas, and the expenditure 101,988,039 drachmas. For 1899 the budget estimate of revenue was 107,085,658 drachmas, and of expenditure 103,418,273 drachmas. The estimate of revenue for 1900 was 22,856,000 drachmas from direct taxes, 40,482,000 drachmas from customs and excise, 20,327,400 drachmas from stamps and fees, 12,710,750 drachmas from monopolies, 4,439,690 drachmas from state property, 1,051,600 drachmas from sales

of state property, 1,942,142 drachmas from repayments and deductions, 472,000 drachmas from telegraphs, 440,000 drachmas from lighthouses, 42,000 drachmas from schools, 5,796,321 drachmas from various sources, and 1,646,946 drachmas from extraordinary sources; total, 112,206,849 drachmas. The expenditures for 1900 were estimated at 32,609,650 drachmas for the public debt, 117,300 drachmas for allowances, 185,000 drachmas for various obligations, 6,254,013 drachmas for pensions, 1,325,000 drachmas for the civil list, 538,620 drachmas for the Boule, 2,424,122 drachmas for the Ministry of Foreign Affairs, 6,363,679 drachmas for the Ministry of Justice, 16,266,061 drachmas for the Ministry of the Interior, 5,214,047 drachmas for the Ministry of Worship, 18,308,586 drachmas for the Ministry of War, 7,824,948 drachmas for the Ministry of Marine, 2,157,220 drachmas for the Ministry of Finance, 10,511,392 drachmas for collection of taxes, and 3,898,830 drachmas for various purposes; total, 114,088,468 drachmas. The revenue for 1901 was estimated at 115,734,159 drachmas, and the expenditure at 113,646,301 drachmas. The administration of the *régie* and the collection of the assigned duties is entrusted to a Greek company under the control of the International Commission.

In instituting the International Debt Commission the powers consented to a reduction of the rate of interest on the gold debt and arranged a plan of amortization. The gold debt on Jan. 1, 1900, amounted to 701,967,000 drachmas, the annual interest and amortization to 15,035,057 drachmas. The paper debt, including 93,775,975 drachmas of paper currency, amounted to 173,690,760 drachmas, requiring 5,083,500 drachmas for interest and amortization. The paper currency of Greece fluctuates in value, no coin having been put into circulation since 1884. Notes are 40 per cent. below par on the average. The National Bank is privileged to issue 88,000,000 drachmas. The amount in circulation on Jan. 1, 1901, was 140,500,000 drachmas, with only 1,900,000 drachmas of gold and silver to protect the issue, and no coin in circulation. The reduction of the issue in annual instalments has been decreed, beginning in 1900. The International Commission reported for the third year of its operations, ending Jan. 13, 1901, receipts amounting to 1,756,220 drachmas in gold and 54,539,811 drachmas in paper, and expenditures amounting to 1,359,917 drachmas in gold and 49,878,553 drachmas in paper. On Jan. 1, 1901, the gold debt had been reduced to 697,554,000 drachmas, the paper debt to 171,424,980 drachmas. The proceeds of the revenues assigned to the commission were 32,342,713 drachmas, not including the Piræus customs, which are handed over to the Government, being regarded as an additional guarantee. The revenues handled by the commission exceeded the fixed estimate by 3,442,713 drachmas, which with 1,073,617 drachmas realized as profit on the rate of exchange enabled the commission to augment the interest paid on the monopoly and funding loans by 4 per cent., and on the other groups by 2 per cent. The rate of exchange fluctuated between 149 and 173, the mean rate of 164 being 8 points higher than in 1899 owing to the exhaustion of the loan guaranteed by the powers, bad harvests, an adverse balance of trade, the decline of Greek credit as the result of the war with Turkey, and the excess of the forced currency. The currency, however, should in the opinion of the commission be withdrawn gradually, and not at once by means of a financial operation, which might involve the country once more in economic difficulties and create a new era of instability. The amount withdrawn

annually according to the plan that the commission put in force in 1900 is 2,000,000 drachmas, which it is believed can be increased in view of the unexpected growth of the revenue with the effect of improving the rate of exchange and, by showing that the Government is prepared to make sacrifices for the restoration of normal monetary conditions, Greek credit in general. The increase of the tobacco duty in March, 1900, caused a diminution of consumption and a loss of revenue, which the Government had to make good to the Debt Commission below a minimum agreed upon. The company having the monopolies is charged with the commission of administering those revenues unsatisfactorily, and introducing politics into the appointment of its *personnel*. The measures for the prevention of fraud and contraband traffic which the commission recommended were rejected by the Chamber. The Government in 1901 asked the Chamber to vote 2,500,000 drachmas a year for naval construction and 1,500,000 drachmas annually for 12 field and 12 mountain batteries and 60,000 Mannlicher rifles. The International Commission has agreed to a loan for the construction of the Piræus-Demirly Railroad, the service of which will be 3,763,512 drachmas a year, and for another loan to complete the line from Pyrgos to Kyparissa and Meligala in the Morea.

The Army and Navy.—The Greek army is in process of reorganization. The Crown Prince was appointed commander-in-chief with the rank of lieutenant-general by the law of April 6, 1900, which placed the army under his inspection. There are 3 divisions, containing 10 regiments of infantry, 8 battalions of *euzoni*, or riflemen, 3 regiments of cavalry, 3 regiments of field-artillery, and 1 regiment of engineers. The nominal peace strength in 1899 was 26,108 men, but the actual strength was about 10,000 less. Every Hellene is liable for service, and those who are not drawn pay a tax varying from 100 to 1,000 drachmas, and are enrolled in the reserve of the active army and trained for three months. The period of service is two years in the active army, ten years in the reserve, eight years in the National Guard, and ten years in its reserve. The nominal strength in 1900 was 62 officers in the Ministry of War and the general staff, 873 officers and 13,180 men in the infantry, 96 officers and 1,448 men in the cavalry, 216 officers and 2,584 men in the artillery, 101 officers and 1,381 men in the engineers, 380 officers and 479 men in the administrative services, 28 officers and 105 men in the military schools, and 139 officers and 4,108 men in the *gendarmerie*; total, 1,894 officers and 4,108 men, with 3,916 horses and 180 guns. The infantry have Gras rifles, the cavalry carbines of the same construction, and the artillery Krupp guns. The war strength of the active army is about 82,000 men, and of the National Guard 96,000 men.

The navy comprises 5 armor-clads, the principal ones being the French-built steel-belted cruisers Hydra, Spetsai, and Psara, of 4,885 tons, armed with 3 10.6-inch, 5 5.9-inch, 1 4-inch, and 4 9-pounder Canet guns, with 7 6-pounder quick-firers and numerous smaller ones. There are 7 large and 44 small torpedo-boats.

Commerce and Production.—Wheat, barley, and corn are the principal agricultural crops. The Zante currant is the most important product for export. The olive and the grape are cultivated extensively, and the crop of figs is important. Tobacco is raised also for export, and cotton is grown to some extent. Valonea from the native acorn-tree, a useful tanning material, is an important export. In accordance with the reten-

tion law of 1895 to regulate the supply of dried currants the Government retains 15 per cent. of each shipment, selling this portion to makers of wine and brandy, and turning the proceeds over to an agricultural bank, the special business of which is to assist the growers of currants. The law was extended for a further period of ten years in 1899, and in that year the bank was established with an initial capital of 3,500,000 drachmas, which will be augmented from the further proceeds of the sales. The currant crop of 1899 was 153,500 tons, of which 126,400 tons were left for export, but only 91,300 tons were exported. A deficient crop in 1900 relieved the depression. The crop of valonea in 1899 was 10,000 tons. The production of silk cocoons in Messenia, the only province where this industry is established, was 100,000 pounds. The important mining interests are in the district of Laurium, where the production was 306,625 tons of manganese iron ore, 134,384 tons of hematite ore, 23,710 tons of zinc ore, 15,749 tons of galena, 1,195 tons of dress lead and zinc ore, 3,000 tons of lead smokes, 2,100 tons of speiss, and 289,292 tons of inferior ore from which 18,360 tons of silver lead were obtained.

The total gold value of special imports in 1899 was 128,085,906 drachmas; of special exports, 94,665,611 drachmas. The imports of cereals were 35,081,749 drachmas in value; of textile fabrics and yarn, 20,827,756 drachmas; of timber and wood, 9,141,698 drachmas; of minerals, including coal, 8,910,480 drachmas; of hides, 8,715,618 drachmas; of fish and caviar, 6,631,106 drachmas; of metals and ores, 6,240,992 drachmas; of live animals, 5,567,781 drachmas; of chemicals, 3,803,693 drachmas; of sugar, 2,924,402 drachmas; of paper, 2,730,513 drachmas; of coffee, 2,483,731 drachmas; of glass and crockery, 2,100,203 drachmas; of rice, 1,893,038 drachmas; of colors, 940,293 drachmas; of other articles, 16,085,906 drachmas. The exports of currants were 38,007,954 drachmas; of ores, 23,860,014 drachmas; of wine, 6,480,924 drachmas; of tobacco, 2,826,871 drachmas; of olive-oil, 2,676,366 drachmas; of figs, 2,438,772 drachmas; of silk and cocoons, 1,790,402 drachmas; of valonea, 1,609,958 drachmas; of brandy, 1,448,889 drachmas; of sponges, 1,320,040 drachmas; of olives, 869,758 drachmas; of gunpowder, 621,800 drachmas; of emery, 467,838 drachmas; of cement, 411,156 drachmas; of soap, 317,690 drachmas; of fruit, 260,306 drachmas; of other articles, 9,239,873 drachmas.

The values in gold drachmas of the special imports from and special exports to different countries in 1898 are given in the following table:

COUNTRIES.	Imports.	Exports.
Great Britain	41,485,989	28,013,098
Russia	33,246,991	1,674,076
Turkey and Egypt	16,979,666	10,724,221
Austria-Hungary	16,607,899	8,473,008
France	12,095,343	9,755,251
Germany	11,337,703	5,495,478
Belgium	4,547,714	8,033,712
Italy	5,294,651	4,066,503
United States	4,602,312	4,024,035
Netherlands	1,193,949	5,691,018
All other countries	5,924,821	2,272,201
Total	153,219,038	88,221,601

Railroads, Posts, and Telegraphs.—The railroads, having a total length of 591 miles, are being extended from Piræus northward to Demerly, Thessaly, eventually to connect with the European system at Salonica, and southward to Pyrgos, Meligala, and Kyparissa in the Peloponnesus. The surplus of the assigned revenues is

available for the railroad to the Turkish frontier and for the line into the Morea, which has been begun.

The telegraph-lines, including cables, have a length of 5,300 miles, with 6,200 miles of wire. The post-office in 1899 forwarded 3,510,247 letters and postal cards and 5,136,138 newspapers, circulars, and samples in the internal and 2,581,151 letters and postal cards and 1,014,205 newspapers, circulars, and samples in the international service; receipts, 1,950,372 drachmas; expenses, 1,958,700 drachmas.

Politics and Legislation.—Little progress has been made in legislation by the Theotokis ministry, which, notwithstanding its majority in the Boule over all the Opposition parties united, has not ventured to present in the face of obstruction projects of incontestable utility, and has carried through useless measures to please the different groups of the majority. A movement for the revision of the Constitution has been organized which contemplates the institution of a Senate to review and correct the action of the popular body. Petitions have been circulated in favor of permitting the Government to rule without the Boule in an emergency.

The award of the ambassadors at Constantinople who were to arbitrate the points of difference between Greece and Turkey, regarding specially the diplomatic privileges in the Ottoman Empire of Greece, which claimed similar rights to those enjoyed under the capitulations by other powers, was signed on April 3, 1901, having been drawn up by the German ambassador and accepted with slight emendations by the ambassadors of the other powers that intervened to bring the war between Greece and Turkey to an end in 1898. The capitulations that Greece enjoyed before the war and her position as a most favored nation in Turkey were declared to have been terminated by the declaration. Instead of the former status a new one not less favorable is created, in which the Hellenic Kingdom occupies an intermediate position between the states that enjoy the full advantages of the capitulations and those that have no capitulations. Greece is permitted to retain in the main jurisdiction over her subjects in Turkey. The Greek minister at Constantinople endeavored to secure favorable conditions by direct negotiation with the Porte. A great many of the Greeks in Turkey who formerly claimed Hellenic nationality inscribed themselves as *protégés* of France, Italy, or other countries. The consular convention on which negotiations were pending could not be concluded until the ambassadors gave their award. By virtue of this award the Greek consulates retain all the authority and immunities that were secured by former agreements, and these rights are more clearly defined so as to prevent abuses. The consular authorities must keep a register of the Hellenic citizens over whom they have jurisdiction. The decision regarding jurisdiction in disputed cases rests with Greek and Turkish arbitrators. The old claim of Turkey to collect the trade tax from Greeks under the treaty of 1856, which Greece has for twenty years disputed, was not mentioned in the award. When the Greek Government in July notified the Porte of an intention to send a squadron on a visit to Salonica and Smyrna, the Ottoman Government declined on political grounds to authorize the visit. Against this attitude the Greek Government protested, holding it to be arbitrary and illegal between friendly governments.

A students' outbreak in November drove the ministers to offer their resignations in order that

the responsibility for the disturbance might be determined by their successors. The cause was a translation of the Gospel into modern Greek which M. Psychari wished to introduce. He obtained the support of Queen Olga, who in visiting the camps and hospitals during the Turkish war found that the soldiers had no version of the Bible which they could read. The Queen induced the Metropolitan, Procopius Cconimidis, to give his approval to the translation, although the Holy Synod had condemned it in 1899. The Queen herself had arranged for the publication of the translation, and some of the newspapers advocated its official introduction. The scholars of Greece generally looked upon the proposed innovation as one tending to debase and denationalize the language. Since the deliverance of Greece from Turkish rule they had been endeavoring to extirpate the corruptions which four hundred and thirty years of Venetian and Ottoman domination had introduced into the language, to banish Italian, Slavic, and Turkish words and idioms, and to restore the Greek of Xenophon and of Chrysostom until the official language and the language of educated society was once again pure Greek. Hence the Athenians, and most of all the students, regarded as a national danger and a relapse into barbarism the recognition and perpetuation of the discarded vernacular through an authorized popular translation of the Scriptures. The members of the Government sympathized with this view. The espousal of the Queen's project by the Metropolitan led to violent demonstrations by the students of the university. The populace of the capital joined in the riots. The troops interfered, and were assailed with stones and revolvers, and they fired back, mostly in the air. Many persons were killed or wounded. The ministers held the Metropolitan responsible, and demanded his resignation. He refused at first, and afterward signed the resignation when the King and Prime Minister both demanded it. The Opposition in the Boule, led by M. Delyannis, accused the ministry of weakness and of being responsible for the loss of life, and then they insisted on resigning.

GUAM, the principal island in the Ladrone or Marianne group, occupied by the United States in the war with Spain and ceded by the treaty of peace concluded at Paris on Dec. 11, 1898. It has an area of nearly 200 square miles and about 9,000 inhabitants, descendants of immigrants from the Philippine Islands. Of these 6,000 live in Agana, the capital. There are 18 schools, and 90 per cent. of the people can read and write. Both English and Spanish are spoken. The island is well wooded and very fertile, having an abundance of water. A garrison of United States marines is posted there, and coal is kept for United States naval vessels. Many of the captured Filipino rebel chiefs have been sent to Guam as prisoners of war.

GUATEMALA, a republic of Central America. The legislative power is vested in the National Assembly, containing 69 members, elected for four years by universal adult male suffrage, and in the Council of State, consisting of 13 members, part of them elected by the Assembly and part appointed by the President. The executive power is vested in the President, who according to the Constitution is elected by the people for six years, and may not be a candidate for reelection. Manuel Estrada Cabrera was proclaimed President of the republic by the National Assembly on Sept. 25, 1898, for the term ending March 15, 1905. The Cabinet at the beginning of 1901 consisted of the following members: Secretary of State for the In-

terior and Justice, Juan J. Argueta; for Foreign Affairs, Juan Barrios; for War, Luis Molina; for Public Works and Agriculture, Rafael Spinola; for Finance, Guillermo Aguirre; for Public Instruction, J. A. Mandujano.

Area and Population.—The estimated area is 48,290 square miles, with 1,574,340 inhabitants in 1900. The number of births in 1899 was 71,998; of deaths, 34,629. Education is compulsory and gratuitous, and in 1895 there were 1,266 public schools, with 64,015 pupils in attendance.

Finances.—The revenue collected in 1899 was \$8,566,906 in currency. The estimated revenue for 1900 was \$9,770,000, and expenditure \$9,611,201. Of the revenue \$4,340,000 was the estimated yield of customs duties, \$3,760,000 that of taxes, \$1,370,000 the profits of monopolies, and \$300,000 the net revenue from posts and telegraphs. Of the expenditures \$54,620 were assigned to the National Assembly, \$72,000 to the executive, \$1,421,524 to the Department of the Interior and Justice, \$146,100 to that of Foreign Affairs, \$3,157,856 to that of Finance, \$950,388 to that of Fomento, \$1,998,203 to that of War, \$1,513,915 to that of Public Instruction, and \$296,595 to various expenses.

The foreign debt on Jan. 1, 1900, amounted to \$9,087,465 in gold, the internal debt to \$25,763,776 in silver. The foreign debt consisted of a 4-per cent. loan contracted in 1895, reported by the council for foreign bondholders to amount to £1,571,768, including £88,968 of arrears of interest; and in addition to this of loans contracted in Germany and elsewhere in 1897 and 1898 amounting to \$828,125 in gold and railroad and other gold obligations amounting to \$548,729. The banks of the country were authorized in October, 1898, to issue \$6,000,000 in notes which are legal tender for all obligations, even such as have been contracted specifically in silver. Revenues are collected in currency, and gold and silver have disappeared from the country and foreign exchange has risen to an enormous premium.

The Army.—The legal strength of the active army is 673 superior officers, 2,305 subordinate officers, and 56,915 men; that of the reserve, 29,439 of all ranks. The actual number of officers and men in active service may be 7,000. By the law of May 23, 1888, every able-bodied man between the ages of eighteen and twenty-five who pays less than \$50 taxes is obliged to serve unless he is an only son or a public functionary, and after completing his term in the regular army he is enrolled in the militia until he reaches the age of fifty years.

Commerce and Production.—The soil of Guatemala is exceedingly productive, and German settlers and others have developed the cultivation of coffee with profit in spite of an export duty which was fixed in 1900 at \$6 a quintal. The export of coffee in 1899 was 841,945 quintals. The yield of tobacco was 9,350 quintals; of sugar, 113,570 quintals; of bananas, 11,872 bunches; of cacao, 1,872 quintals. Wheat, corn, and beans are the principal food crops. Grazing is good on the higher table-lands. The number of horses in 1899 was estimated at 50,343; of cattle, 196,780; of sheep, 77,600; of hogs, 29,784. The total value of exports in 1899 was \$8,370,555 in gold. The export of coffee was valued at \$7,390,477; of sugar, \$250,360; of bananas, \$118,047; of rubber, \$256,921; of hides and skins, \$267,970. The quantity of coffee exported was 841,945 quintals, of which 487,022 quintals were shipped to Germany, 183,960 to Great Britain, and 156,964 to the United States. Of the imports of Guatemala about 41 per cent. are supplied by the United

States, 28 per cent. by Great Britain, 24 per cent. by Germany, and 6 per cent. by France. The chief imports are cotton cloth, flour, provisions, drinks, and iron manufactures. The duties on imported goods were lowered 30 per cent., and the period was extended in August by a Government decree till Dec. 31, 1901.

Railroads, Posts, and Telegraphs.—Guatemala la Nueva, the capital, of whose 72,000 inhabitants 80 per cent. are of European birth or descent, is connected by a railroad, 85 miles in length, with Escuintla and San José, and a new one connecting it with Port Barrios has been

partly constructed by American engineers. The Central American Improvement Company has undertaken to complete the line, 210 miles in total length, receiving 500,000 acres of land and the right to operate the railroad for ten years, after which it will be turned over to the Government for the agreed price of \$4,000,000. The railroad connecting the capital with the port of Iztapa, on the Pacific, has already been built.

The post-office in 1899 received 5,684,613 letters, newspapers, and other pieces of mail-matter, and despatched 4,051,823. There were 3,400 miles of telegraphs in 1899; number of messages, 796,192.

H

HAWAII, a Territory of the United States, formerly an independent kingdom, proclaimed a republic in 1894 after the abdication of Queen Liliuokalani, and formally annexed to the United States on Aug. 12, 1898, in accordance with a joint resolution of the United States Congress, an annexation treaty having been signed at Washington on June 16, 1897, by the Secretary of State and envoys of the Hawaiian Republic. On June 14, 1900, the islands were organized as a Territory of the United States in accordance with the act of Congress approved April 30, 1900, which admitted to citizenship of the United States all persons who at the date of the proclamation of annexation were citizens of the Hawaiian Republic. Sanford B. Dole, President of the Hawaiian Republic, was appointed Governor of the Territory.

Area and Population.—The islands have an area of 6,740 square miles, with a population estimated in 1898 at 117,281. At the census of June 14, 1900, the population was 154,001. In 1896 it was 109,020, of which number 7,570 were engaged in agriculture, 2,100 in fishing and navigation, 2,265 in industry, 2,031 in commerce and transportation, 2,580 in the liberal professions, 4,310 in various occupations, 34,498 were laborers, and 53,726 were without occupation. The number of immigrants in 1898 was 17,229 and the number of emigrants 7,313. In 1899 the immigration was 20,245.

Finances.—The revenue in 1899 was \$3,345,231, of which \$1,295,628 were derived from customs, \$1,068,117 from taxation, and \$981,486 from internal-revenue duties. The expenditure for the public debt was \$260,976; for education, \$340,073; for the military, \$37,383; for public works, \$372,415; for sanitary works, \$246,145; for justice, \$308,215. The debt of the former Government was \$4,890,351 at the end of 1899. By the resolution of Congress the United States assumed the debts of the former republic not to exceed \$4,000,000.

Commerce and Production.—The principal product is sugar, and next to that rice, but coffee and bananas are exported, and hides and skins and wool in small quantities. The value of sugar exported in 1899 was \$21,898,190, amounting nearly to 97 per cent. of the total exports, which were \$22,628,000 in value, while imports were valued at \$19,059,000. The value of coffee exported was \$132,347; of bananas, \$84,268; of rice, \$42,562. Of the exports 99.5 per cent. went to the United States, whence were brought 78.8 per cent. of the imports, and from Great Britain 11.25 per cent. The imports are for the most part groceries and provisions, flour, clothing, timber, machinery, hardware, and cotton cloth. In 1900 the value of sugar imported from the Hawaiian Islands into the United States was \$19,792,150, while the ex-

ports of iron and steel manufactures to Hawaii were \$4,064,306 in value; of timber and wood manufactures, \$1,314,957; of breadstuffs, \$1,022,955. From June 14, 1900, the customs tariff and navigation laws have been in force in Hawaii, and no separate reports of commerce are made.

Politics and Legislation.—The ascendancy of the Home Rule party, in spite of the intention of the framers of the Constitution to keep control by the restriction of the native vote, brought about a conflict between the Legislature and the executive. The Home Rulers controlled both houses of the Legislature in its first session, which was followed by a supplementary session. In the voting for a delegate to Congress they elected Robert W. Wilcox by 4,002 votes, against 3,756 cast for Sam Parker, the Republican candidate, and 1,650 for Prince David Kaunauka, the candidate of the Democrats. Some of the elected members on the majority side of both houses were men from the humbler walks of life—fishermen, hackmen, and the like—who were entirely ignorant of English. Although the organic act prescribes that proceedings must be in English, the Legislature voted that Hawaiian might also be used, the speeches delivered in the native language being repeated in English by interpreters. The Legislature passed many acts that were vetoed by the Governor and others that he condemned, and spent much time in discussions as vain as they were violent, and at the end of the sixty days which constitute the legal period for a session it had not yet made appropriations for the schools or for public works that were in progress. Mr. Akima, the Speaker of the House, appealed to the Governor to extend the session for thirty days to enable unfinished business to be transacted. Governor Dole replied that the conduct of the session offered no assurance that such extension would tend to promote the interests of the Territory. One act of the Legislature exempts persons worth less than \$3,500 from proceedings in distraint for the recovery of debt. The poll-tax was abolished, and a 2-per-cent. tax on incomes was imposed. Men having more than 5 children were made exempt from taxation. The quarantine laws of the United States in their application to Hawaii were condemned in a resolution that was introduced, and lacked but few votes of passing. A judicial tangle which divided the judges and involved Gov. Dole in their quarrel was taken up by the Legislature, which interfered in behalf of the new judges belonging to the antimissionary school of politics and against those of the old régime. Circuit-Judge Humphreys, one of the new judges, gave offense to the bar, the members of which petitioned for his removal. George D. Gear, presiding judge of the circuit court, ordered the release of several pris-

oners who had been sentenced for murder and rape, on the ground that their conviction was unconstitutional because a jury of fewer than 12 men had found them guilty. Attorney-General Dole immediately caused their rearrest on the old charge and asked for an appeal, which was denied by the lower court on the ground that in habeas corpus cases no appeal can lie. The Attorney-General then brought the matter before the Supreme Court, in which Chief-Justice Fear and Justice Perry were members of the old *régime*. The circuit court called a special grand jury, and discharged it because it would not act before the Supreme Court had rendered its decision. The Legislature took up the controversy, which was discussed with unbridled license in the Honolulu press. When the session had to be closed by lapse of time the Legislature passed a vote of want of confidence in the Governor, and deputed Mr. Beckley, leader of the Home Rulers, to go to the United States to communicate the same to President McKinley.

HAYTI, a republic in the West Indies, occupying the western third of the island of Hayti. The legislative power is vested in the National Assembly, consisting of a Senate of 39 members, chosen by the lower house for six years from lists submitted by the President and by a college of electors, and of a House of Representatives, 95 in number, elected for three years by all adult male citizens possessing visible means of support. The President is elected by the people, or sometimes by the National Assembly, for seven years. Gen. Tiresias Simon Sam was elected in 1896 for the remainder of Gen. Hippolyte's term, which ends on May 15, 1902. The Cabinet at the beginning of 1901 was composed as follows: Secretary of State for Foreign Affairs, Brutus San Victor; for Finance and Commerce, B. Faine; for the Interior and Police, Tancredi Auguste; for Agriculture and Public Works, C. Leconte; for Justice and Public Worship, L. Cauvin; for War and Marine, V. Guillaume; for Public Instruction, M. Chanzy. President Sam, taking the ground that he was elected for the regular period, not for an unexpired term, announced the intention of remaining in office till May, 1903, the National Assembly in 1896 having passed a resolution declaring that his term will not expire before that date.

Area and Population.—The area of Hayti is estimated at 10,204 square miles. The population in 1894 was 1,210,625 according to an enumeration made by the clergy. Port-au-Prince, the capital, has about 50,000 inhabitants; Cape Haitien, 29,000; Les Cayes, 25,000; Gonaïves, 18,000.

Finances.—The revenue for 1900 was estimated at \$4,516,096 in paper and \$2,912,984 in gold, the expenditure at \$4,499,067 in paper and \$2,913,593 in gold. The export duties, paid in American gold, amounted to \$2,815,902 in 1899; the import duties, paid in currency, to \$2,618,869. American gold in 1899 was at an average premium of 172. There were in circulation \$3,749,000 in paper currency, \$3,500,000 in silver, and \$1,200,000 in American gold.

The external debt on Jan. 1, 1900, was \$12,960,642, bearing 5 and 6 per cent. interest and payable in gold. The internal debt payable in gold, partly secured on the export duty on coffee, was \$6,115,091, besides which there was a currency debt of \$9,372,183.

Commerce and Production.—Coffee is the most valuable crop, and is subjected to a heavy export duty. Cacao is also cultivated, and cotton in increasing quantities. A company has been formed for the cultivation of tobacco. Cattle,

as well as horses and goats, are raised, but their exportation has been checked by the imposition of onerous duties. The mineral wealth of the country is not developed, except that gold is washed in a crude fashion and copper-mines have been opened. A concession has been given for mining coal. Silver, iron, antimony, tin, sulfur, kaolin, nickel, gypsum, and porphyry have been found. Logwood is abundant, and various valuable woods are found in the forests. The export of coffee in the year ending Sept. 30, 1899, was 61,622,184 pounds; of cacao, 4,039,500 pounds; of logwood, 82,836,302 pounds; of cotton, 1,471,992 pounds; of hides, 291,133 pounds; of copper, 22,590 pounds. Other exports are honey and wax, goatskins, and cabinet woods.

HOLLAND. (See NETHERLANDS.)

HONDURAS, a republic of Central America. The legislative power is vested in the Congress, a single chamber of 46 members, elected for four years by universal adult male suffrage. The President of the republic is elected likewise by popular suffrage for four years. Gen. Terencio Sierra was elected President in 1899 for the term ending Jan. 31, 1903, and Gen. José M. Reina was elected Vice-President. The members of the Cabinet at the beginning of 1901 were as follow: Minister of Foreign Affairs, Dr. C. Bonilla; Minister of Public Works, F. Altschul; Minister of Justice and Public Instruction, Dr. Juan A. Arias; Acting Minister of the Interior, Dr. Bonilla; Minister of Finance, D. Fortin; Minister of War, Gen. M. Rosales.

Area and Population.—The area of Honduras is estimated at 45,250 square miles, the population at 407,000. Tegucigalpa, the capital, has about 12,600 inhabitants.

Finances.—The revenue in 1899 was reported to be \$2,351,240, and expenditure \$2,378,565. For 1901 the estimate of revenue was \$2,423,000, of which \$970,000 were from customs and \$800,000 from the spirit monopoly. The estimated expenditure was \$2,416,824, of which \$814,124 were required for the army, \$419,708 for public works, and \$405,695 for the interior.

The foreign debt in the middle of 1900 was stated to amount to £18,298,258, of which £12,899,688 were arrears of interest. The internal debt was \$1,800,812. The Honduras Government in 1897 signed a contract giving the management of the customs to a New York syndicate which assumed the English-held debt which has blighted the country's prosperity since 1870. The bonds were given for the construction of a railroad across the isthmus. The original issue was £1,000,000, and with fresh issues the debt grew to £5,000,000, and the promoters of the railroad scheme who handled all the money expended only a fraction of it on the railroad, building the section from Puerto Cortez to La Pimienta, and calling upon the Government to issue more bonds in order to carry it farther. The credit of the Government was already exhausted when the conclusion was reached that it had been swindled. The British Government declined to use pressure to enforce the collection of this debt after investigating it and finding all the transactions tainted with fraud. Nevertheless, the Honduras Government acknowledged the obligation, and has tried various plans for discharging the debt. The railroad was leased to St. Louis capitalists from 1892 till 1897 for \$25,000 a year. The syndicate of New Yorkers which then took it and the concession of the customs agreed to pay the Government \$1,000,000 a year, to wipe out the bonds, to complete the railroad across the isthmus in five years, and to establish a bank. The work of

extending the railroad was begun in earnest, but after a while operations were stopped. The syndicate found that the customs revenue fell away from the time it took charge, and accused the Government of allowing smuggling to go on wholesale without taking any steps to stop it. The Government retorted that the syndicate was taking no steps toward clearing off the bonds. The friction resulted in the abandonment of this part of the undertaking by the syndicate, which had to contribute \$200,000 to the \$1,000,000 that it paid the Government. The Government resumed charge of the customs, each party charging the other with bad faith. Before another year had expired the syndicate brought another charge against the Government of breach of contract. The Government had promised alternate sections of land on either side of the route of the railroad from La Pimienta to Amapala, yet in the treaty for the union of Honduras with Nicaragua and Salvador to form the Greater Republic of Central America the Pacific coast of Honduras was ceded for a federal district, and if the union had become a reality Honduras would have placed it beyond her power to carry out the agreement relative to the lands situated in this district. The syndicate managers having threatened to invoke the action of the United States Government, to avert claims for damages the Honduras Government, in May, 1901, made a new contract with the syndicate, in which there were no stipulations regarding the debt, the custom-houses, or the pro-

jected bank, but only a lease of the existing railroad to the syndicate for \$15,000 a year and an agreement on the part of the syndicate to resume work on the extension, accompanied, however, by no guarantees and no conditions except that the lease will become void if the syndicate fails to build 15 miles of new railroad within two years. The syndicate did not resume construction, and the President contemplates the operation of the railroad by the Government after the expiration of the present contract, the profits to be devoted to extending the line, without which the interior of Honduras can never be developed.

Commerce and Production.—Bananas are cultivated extensively for the United States market. Minor products are tobacco, sugar, corn, coffee, indigo, rice, and wheat. Cattle are raised in considerable numbers. The weaving of hats is an important house industry. Gold, platinum, silver, copper, lead, zinc, iron, antimony, and nickel are found in many places and coal is present, but mining is not carried on except washing for gold in the stream beds. The value of imports in 1899 was \$1,409,788 in gold; of exports, \$2,656,661. The export of bananas was \$445,337; of cattle, \$130,682; of coffee, \$53,221; of coconuts, \$65,904; of woods, \$43,258; of silver, \$277,332. Of the total value of imports, \$1,015,435 came from the United States, \$169,076 from Germany, and \$113,216 from Great Britain. Of the exports \$1,710,379 went to the United States, \$55,045 to Germany, and \$39,746 to Great Britain.

I

IDAHO. (See under UNITED STATES.)

ILLINOIS. (See under UNITED STATES.)

INDIA, an empire in southern Asia, under the sovereignty of the King of Great Britain and Ireland, who bears the title of Emperor of India, on the basis of a personal union, and governed under general acts of the British Parliament by a Governor-General in consultation with and under instructions from the Secretary of State for India, a member of the British Cabinet. The Governor-General, popularly called the Viceroy, is advised by a Council of 5 ordinary members, besides the commander-in-chief of the forces, who are appointed for five years. The Legislative Council, composed of the members of the Governor-General's Council and 16 additional members appointed by him on the recommendation of certain public bodies, has power to make laws, subject to the approval of the Governor-General, for all persons within British India, for all British subjects in native states, and for native Indian subjects of the King in foreign countries. British India is divided for purposes of administration into the presidencies of Madras and Bombay, each of which has a Governor, the lieutenant-governors of Bengal, the Northwest Provinces and Oudh, the Punjab, and Burma, and the chief-commissionerships of Coorg, Assam, and the Central Provinces. Each Governor and Lieutenant-Governor has his Legislative Council. The nine provinces are subdivided into about 250 districts. More than 600 feudatory native states are subject to the control of the Governor-General.

George Nathaniel Curzon, created Baron Curzon of Kedleston, has been Governor-General since 1898, when he succeeded Lord Elgin. The members of the Council in the beginning of 1901 were Major-Gen. E. H. Collen, Sir A. C. Trevor, C. M. Rivaz, Sir Edward Fitzgerald Law, and Thomas Raleigh. The commander-in-chief of the forces

was Gen. Sir Arthur Power Palmer. The Governor of Bombay was Lord Northcote; Governor of Madras, Lord Amphilhill; Lieutenant-Governor of Bengal, Sir John Woodburn; Lieutenant-Governor of the Northwest Provinces and Oudh, Sir A. P. H. Macdonnell; Lieutenant-Governor of the Punjab, Sir W. M. Young; Lieutenant-Governor of Burma, Sir F. W. R. Fryer; Chief Commissioner of the Central Provinces, A. H. L. Fraser; Chief Commissioner of Assam, H. J. S. Cotton; Chief Commissioner of Coorg and Resident of Mysore, Col. D. Robertson; Resident at Haidarabad, Sir T. J. C. Chichele-Plowden. At the close of the financial year Major-Gen. Sir Edmond R. Elles succeeded Sir Edwin Collen as Military Member of the Viceroy's Council.

Area and Population.—British India has an area of 965,005 square miles. The population in 1891 was 221,266,000. The area of the feudatory states is 992,000 square miles, and their population was 66,050,000, making the total area of the Indian Empire 1,957,000 square miles, with a total population in 1891 of 287,317,000. The census of 1901 makes the population of the British territory 231,085,000, an increase of 4.44 per cent.; that of the native states 63,181,000, a decrease of 4.34 per cent. The total population of all India was 294,266,701, an increase of 2.42 per cent. The actual increase is 6,949,653, but this includes the population of tracts enumerated for the first time. Eliminating these, the proportionate increase is reduced to 4,283,069, or only 1.49 per cent., compared with 11.2 per cent. in the previous decennium. The native states that were visited by the famine show decreases of 19.23 per cent. in Baroda, 18.1 per cent. in Rajputana, 17.5 per cent. in the Central Indian states, 14.49 per cent. in those of Bombay, 8.19 per cent. in those of the Central Provinces, and 3.14 per cent. in Haidarabad, while the ones that escaped total drought

show increases comparable to those of the similarly situated parts of British India, the rate being 14.24 per cent. in Kashmir, 13.33 per cent. in the states of Bengal, 13.23 per cent. in Madras, 12 per cent. in Mysore, 4.12 per cent. in the Punjab, and 0.91 per cent. in the Northwest Provinces. In British India there was a decline of 12.17 per cent. in Ajmere, 6.48 per cent. in Aden, 4.99 per cent. in Berar, and 3.93 per cent. in Bombay, and an increase of 1.63 per cent. in the Northwest Provinces, 2.40 per cent. in Oudh, 4.28 per cent. in Coorg, 4.72 per cent. in Bengal, 7.24 per cent. in Madras, 7.58 per cent. in the Punjab, 12.67 per cent. in Assam, 14.49 per cent. in Upper Burma, and 21.84 per cent. in Lower Burma. The variations reflect the vicissitudes of the period, but how far the decline in particular tracts is due to enhanced mortality, impaired fertility of the soil, or emigration induced by high prices and the pressure of population on the land, has not been determined. The most marked decrease in the British districts and in the native states is found where the famine was prolonged and severe, and where the ravages of the plague were greatest. The census of 1891 showed a general increase all over India except in certain fever-stricken tracts. The decade ending with 1881 was marked by a wide-spread famine which checked the normal increase, while the period between 1881 and 1891 was practically free from causes involving abnormal mortality. In the last decade there were scanty harvests for several years in some parts, a severe famine in 1896-'97, and in 1899-1900 the worst famine recorded, and furthermore the ravages of the plague in the Bombay Presidency extended over four years, carrying off 700,000 people. The native states, having the poorest soil and natural resources and a less enlightened and efficient administration, were affected much more seriously than neighboring British provinces. In some of them the decrease, due partly to emigration into British territory, was enormous. In Rewa Kantha the population declined from 733,500 in 1891 to 478,000, in Cutch from 558,400 to 487,300, in Udaipur from 1,862,000 to 1,021,600, in Bhopal from 2,006,800 to 1,198,300.

The census of 1901 included the new territories of the Shan States of Burma, the Chin hill tribes, the Baluchistan Agency, Sikkim, and minor areas, while some unimportant areas were omitted because the hostility of the people rendered them unsafe for the enumerators. For the purposes of the census the whole of India was divided into blocks of from 30 to 50 houses, each in charge of an enumerator, every 10 or 15 blocks under a supervisor, and each group of these circles under a superintendent. On the night of March 1 the enumerators went through their blocks with schedules of the population, from which they struck out the individuals who had died or left the block and to which they added those who had arrived and the children newly born. In two weeks the returns were all added together, and the population of all the districts of India was known. The Mussulmans of Bombay, who had a dread experience of the sanitary measures taken to stamp out the plague, made trouble for the enumerators, and the fear of catching the plague made some of them quit their posts. In the Andamans, where a new tribe was discovered which had killed off all its members that were infected with a disease recently introduced, the enumerators were attacked, and escaped by firing on the people they had come to enumerate. The census schedules have a column for defectives, the insane, deaf-mutes, the blind, and lepers being specified; a census of religions, divided into the caste of Hindus

and Jains, tribes having no caste, Sikhs, Buddhists, and others, which will show the extent of the gradual Brahminizing of the casteless tribes; a column showing the language ordinarily used, the number who can read and write English, and the number able to read and write any language; and a column showing the means of subsistence, both the principal occupation and any subsidiary occupation or source of income, distinguishing actual workers and the women, children, and other dependents. Women are less numerous than men in India as a whole, both in British territory and in native states. In certain provinces and states the proportions are different. In Bengal the sexes are almost equal; in Bombay Presidency, Burma, the Northwest Provinces, and the Punjab the males largely predominate; in Madras and the Central Provinces the females are greatly in excess; in the native states of Burma and the Central Provinces there is a smaller surplus of females, and in other native territories the males preponderate. In Calcutta 732,000 males were enumerated and only 389,000 females; in Rangoon, 163,000 males and 69,000 females; in Bombay, 475,000 males and 296,000 females. This discrepancy is due in a great measure to the migration of men to find employment in the industrial centers, and in Bombay to the withdrawal of women from the town owing to the plague. The returns of women everywhere, and especially in great towns, are less complete than those of men on account of native reluctance to give information regarding their women. This is one of the difficulties that make the Indian census necessarily imperfect. The census of the sexes compared with that of 1891 shows that the males have succumbed to famine in a greater degree than females. The returns of population for the British provinces compared with those of the previous decennial census are given in the following table:

BRITISH TERRITORY.	1891.	1901.
Ajmere and Marwar.....	542,000	476,000
Assam.....	5,433,000	6,122,000
Bengal.....	71,346,000	74,713,000
Berar.....	2,897,000	1,491,000
Bombay.....	15,957,000	15,330,000
Sind.....	2,871,000	3,212,000
Aden.....	44,000	41,000
Upper Burma.....	3,362,000	3,749,000
Lower Burma.....	4,408,000	5,371,000
Central Provinces.....	10,784,000	9,845,000
Coorg.....	173,000	170,000
Madras.....	35,630,000	38,208,000
Northwest Provinces.....	34,253,000	34,812,000
Oudh.....	12,650,000	12,884,000
Punjab.....	20,766,000	22,449,000
Baluchistan.....	810,000
Andamans.....	15,000	24,000
Total.....	221,266,000	231,085,000

The population of the native states at both periods was as follows:

NATIVE STATES.	1891.	1901.
Haidarabad.....	11,537,000	11,174,000
Baroda.....	2,415,000	1,956,000
Mysore.....	4,943,000	5,538,000
Kashmir.....	2,543,000	2,906,000
Rajputana.....	12,016,000	9,841,000
Central India.....	10,318,000	8,501,000
Bombay.....	8,059,000	6,891,000
Madras.....	3,700,000	4,190,000
Central Provinces.....	2,160,000	1,983,000
Bengal.....	3,296,000	3,735,000
Northwest Provinces.....	792,000	799,000
Punjab.....	4,263,000	4,438,000
Burma.....	1,228,000
Total.....	66,050,000	63,181,000

In race 195,460,000 of the population in 1891 were of the Indic-Aryan stock, while 52,960,000 were Dravidians, 7,290,000 were Burmese, 2,960,000 Kolarian, 1,330,000 Iranian, 250,000 European, and 139,000 Chinese, Annamese, etc. The birth-rate in 1898 according to the registry was 35.79 per mille in Bengal, 37.35 in the Northwest Provinces and Oudh, 41 in the Punjab, 29.75 in the Central Provinces, 34.11 in Lower Burma, 29.46 in Assam, 27.4 in Madras, 30.94 in Bombay. The death-rate was 26.57 in Bengal, 27.38 in the Northwest Provinces and Oudh, 31.1 in the Punjab, 23.4 in the Central Provinces, 26.13 in Lower Burma, 36.15 in Assam, 21 in Madras, and 29.16 in Bombay. The coolie emigration, mainly to Natal, Demerara, Trinidad, Dutch Guiana, and Fiji, was 10,306 in 1898. Coolie laborers have been employed since 1896 in building the Uganda Railroad. 5,282 having been sent out up to 1898.

There were 164 male colleges in 1899 with 20,842 students, and 5 female colleges with 164 students; 4,926 secondary schools for males with 525,868 scholars, and 472 for females with 43,403 scholars; 95,240 primary schools for males with 2,824,257 scholars, and 5,618 for females with 313,289 scholars; 41,515 private schools for males with 558,914 scholars, and 1,290 for females with 42,926 scholars; and 651 training and special schools for males with 25,787 scholars, and 69 for females with 2,371 scholars; in all, 142,494 schools for males with 3,955,668 scholars, and 7,454 for females with 402,153 scholars. Of the total number of schools 22,804 were public, 61,494 aided by the Government, and 65,650 private and unaided. The University of Calcutta had 2,721 students in 1898, the University of Madras 1,515, and there were 1,042 and 1,082 at the University of Bombay and the Punjab University respectively, and 637 at the University of Allahabad. The educational expenditure in 1899 was Rx 3,621,553.

Finances.—The total public revenue for 1899 was 1,014,266,930 rupees. The expenditure was 974,653,830 rupees, of which 729,776,180 rupees were expended in India and 244,877,650 rupees in England. The revenue collected by the Government of India was 184,402,310 rupees, and the expenditure of the General Government 240,827,520 rupees; the revenue of the Central Provinces was 25,821,890 rupees, and expenditure 16,855,540 rupees; the revenue of Burma was 69,890,400 rupees, and expenditure 44,629,220 rupees; the revenue of Assam was 14,448,380 rupees, and expenditure 12,176,870 rupees; the revenue of Bengal was 206,258,630 rupees, and expenditure 98,946,760 rupees; the revenue of the Northwest Provinces and Oudh was 125,035,420 rupees, and expenditure 60,698,290 rupees; the revenue of the Punjab was 93,601,470 rupees, and expenditure 53,020,890 rupees; the revenue of Madras was 142,864,770 rupees, and expenditure 102,498,590 rupees; the revenue of Bombay was Rx 148,000,340, and expenditure Rx 100,122,500; the receipts in England were 3,643,320 rupees. The land revenue in 1899 was 274,593,130 rupees, not reckoning the addition charged on account of irrigation; opium revenue, 57,253,300 rupees; revenue from salt, 90,998,710 rupees.

The revised estimates for the year ending March 31, 1900, make the total revenue for that year 1,027,985,500 rupees, the land revenue yielding 258,012,000 rupees according to the estimate; opium, 66,057,000 rupees; salt, 88,187,000 rupees; stamps, 48,475,000 rupees; excise, Rx 57,909,000; provincial rates, 37,718,000 rupees; customs, 47,299,000 rupees; assessed taxes, 19,540,000 rupees; forests, 18,656,000 rupees; registration, 4,221,000 rupees; tribute, 9,261,000 rupees; interest, 9,069,

000 rupees; post-office, telegraphs, and mint, 36,994,000 rupees; civil departments, 17,629,500 rupees; miscellaneous sources, 8,180,000 rupees; railroads, 246,964,000 rupees; irrigation, 36,228,000 rupees; buildings and roads, 6,627,000 rupees; military departments, 10,359,000 rupees. The total expenditure for 1900 according to the estimates was 992,679,000 rupees; excluding 2,985,000 rupees of provincial balances, it was 989,694,000 rupees, of which 29,317,500 rupees were for interest, 18,894,000 rupees for refunds and compensation, 93,118,500 rupees charges of collection, 29,581,000 rupees expenses of the post-office, telegraphs, and mint, 161,733,500 rupees civil salaries, 60,778,500 rupees miscellaneous civil charges, 31,094,500 rupees famine relief and insurance, 36,000 rupees railroad construction charged against revenue, 247,091,000 rupees railroad revenue account, 33,626,500 rupees for irrigation, 61,961,500 rupees for buildings and roads, 225,443,500 rupees for the army, 3,000 rupees for defense works. The budget estimate of revenue for the year ending March 31, 1901, was 1,052,337,500 rupees, and the estimate of expenditure was 1,058,191,000 rupees reduced by receipts from provincial balances to 1,049,932,000 rupees. Not included in the budget is the expenditure on capital account, amounting in 1900 to 45,640,000 rupees, and in 1901 to 23,264,500 rupees. The sum of 88,836,000 rupees is added to the expenditures for 1901 to provide for the redemption of the stock of the Great Peninsula Railroad, which was purchased by the Government on June 30, 1900. The deficit anticipated for 1900 was wiped out by increased railroad and other receipts, and there was a surplus of 41,519,345 rupees, an improvement of 3,330,000 rupees over the revised estimates. The railroads showed a net profit of 1,145,000 rupees. In the budget for 1901 the land revenue was reckoned at 271,180,000 rupees; opium revenue, 68,397,000 rupees; salt revenue, 87,676,000 rupees; stamps, 49,011,000 rupees; excise, 57,290,000 rupees; provincial rates, 39,196,000 rupees; customs, 47,013,000 rupees; assessed taxes, 19,597,000 rupees; forest receipts, 17,833,000 rupees; registration, 4,402,000 rupees; tribute, 9,277,000 rupees; interest, 9,460,000 rupees; post-office, telegraphs, and mint, 35,963,000 rupees; civil departments, 17,663,000 rupees; miscellaneous receipts, 8,161,500 rupees; railroad receipts, 256,973,000 rupees; irrigation receipts, 36,094,000 rupees; from buildings and roads, 6,657,500 rupees; from military departments, 10,563,500 rupees. The estimated expenditure in 1901 for interest was 29,427,000 rupees; for refunds and compensation, 18,657,000 rupees; charges of collection, 96,200,000 rupees; for post-office, telegraphs, and mint, 31,666,000 rupees; for civil salaries, 166,342,000 rupees; for miscellaneous civil charges, 59,011,000 rupees; for famine relief and insurance, 50,525,000 rupees; for railroad construction, 1,278,000 rupees; railroad revenue account, 264,253,500 rupees; irrigation, 34,507,000 rupees; for buildings and roads, 62,442,000 rupees; for the army, 243,881,500 rupees. The material loss to India caused by the famine is estimated at £50,000,000. The charge borne by the revenue for relief exceeded £10,000,000, besides advances and loans amounting to £5,000,000. The relief expenditure was met without any additional taxation. In the financial year 1901 a deficiency was looked for. There was, however, an increase under nearly all the heads of revenue, so that a surplus was realized amounting to £1,824,000, reckoning 15 rupees to the pound sterling. This does not include a profit of £3,000,000 from the coinage of rupees. The increase of revenue over 1900 was £2,100,000, the high price of opium giving £572,000 additional, salt £106,

000, railroad receipts £965,000, irrigation £208,000. Land revenue, on the other hand, showed a decrease of £383,000. There was an increase in expenditure of £876,000 for famine relief and insurance, £323,000 for operating railroads, and £200,000 for interest, and a decrease of £118,000 for public works other than railroads, £1,185,000 for army services, chiefly savings from the employment of troops by the Imperial Government in South Africa and China, and £124,000 in the expenditure of the civil departments. The budget estimate for the year ending March 31, 1902, make the revenue £1,086,000 more than the revised estimate for 1901, an increase of £475,000 being anticipated in land revenue, £331,000 in railroad receipts, and £183,000 under other heads, while in opium revenue lower prices are expected to cause a decrease of £589,000, in customs a lower estimate of sugar imports causes a decrease of £136,000, and £127,000 less are expected from irrigation. In expenditure an increase of £2,062,000 is estimated for army services, £652,000 for railroads, £728,000 for other public works, £493,000 for civil departments, and £124,000 for miscellaneous civil charges, while on famine relief and insurance the expenditure is estimated at £3,245,000 less, leaving the net increase £923,000, excluding mint operations, which gives an estimated surplus of £691,000. The sum of 16,400,000 rupees is allotted as a grant in aid to provincial revenues to restore financial equilibrium. The capital expenditure for 1902 is stated at £5,395,000 for railroad and irrigation works and £1,247,000 for discharge of temporary debt, etc., and the capital receipts will be £691,000 from the imperial surplus. £1,663,000 to be raised by railroad companies, £2,240,000 from new loans, including £1,000,000 in England and 20,000,000 rupees in India, £502,000 from savings-bank deposits, etc., and £111,000 from repayments of advances. The railroad program proposes the expenditure of 46,000,000 rupees on open lines, 45,900,000 rupees on lines under construction, and 11,300,000 rupees on lines only recently begun. The expenditure on irrigation works will be 10,000,000 rupees. The famine expenditures of 1901 were 63,400,000 rupees for direct relief, 41,100,000 rupees in loans to native states, and 14,200,000 rupees for special agricultural advances, while the loss of land revenue and provincial rates amounted to 14,700,000 rupees and compensation for dearth of provisions to 6,600,000 rupees. A royal commission that was appointed to inquire into the relations between Indian finance and the imperial exchequer spent several years in taking evidence, and then ceased to do anything until questions in the House of Commons and threats of proceedings against the members for contempt extracted a report. The commission recommended that charges amounting to £257,000 a year that had been borne by the Indian treasury be transferred to British expenditure. The Imperial Government decided to assume this burden henceforth. Statesmen who deem the financial administration of the English in India to be unjust in many respects thought that in view of the losses sustained by India through recent calamities it would be right to reimburse India for the past expenditure under the same heads to the amount of about £6,000,000. Lord George Hamilton denied the principle that the payment was a restitution, and in a year when the British budget showed an enormous deficit and that of India a surplus fewer voices than ever were raised in the House of Commons for the righting of India's financial wrongs, such as the contribution of £43,000 a year toward defraying the expenses of British consular establish-

ments and embassies in Persia and China, the heavy charges for the support of the entire establishment of the Secretary of State for India, and the millions that should be available for irrigation and for other purposes to prevent famine that India is obliged to raise every year by a most oppressive system of taxation in order to pay enormous military expenses for the security and aggrandizement of the British Empire. The Government of India, which spoke slightly of irrigation as a preventive of famine while vast sums were being diverted to the northwest fortifications now regarded as of little use, has decided to promote irrigation by public enterprise if private enterprise can not be induced to enter this field; to correct the land assessments, now acknowledged to be too high in some provinces; and to establish agricultural banks, at first experimentally, for the purpose of rescuing cultivators from the grip of money-lenders. Lord Curzon has instituted an inquiry into the system of education with a view to the development of industrial and technical education, for the development of which he perceives a serious need, while literary education and the English branches studied eagerly with the object of obtaining official positions has been overstimulated, and its effect in Europeanizing natives has not been always beneficial. The displacement of native handicrafts through the importation of machine-made goods and the establishment of factories in India has increased the proportion of agriculturists, who form four-fifths of the population of a country peculiarly liable to drought. The fostering of indigenous industries through the efforts of the present Viceroy is therefore an additional means of famine insurance.

The total expenditure for 1902 was estimated at £16,345,000, an increase of £1,745,000 over the average for the last three years. The increased expenditures on irrigation and on public works for the development of the economic resources of the country, as well as for famine insurance, was coupled with extraordinary military expenditures, of which 9,400,000 rupees were for new artillery, rifles, and ammunition, 825,000 rupees for factories for manufacturing munitions of war, and 2,150,000 rupees for animals and transport. The initial expenditure of £2,333,333 was sanctioned in order that India might benefit by the lessons of the frontier warfare of 1897. The rearmament of the native army and the volunteers, which will be completed in 1903, instead of in 1905 as originally intended, will cost £1,360,000. The extra military expenditure for 1902 is £1,008,000.

The Government of India has begun to accumulate a gold reserve to safeguard the gold standard which is officially held to have aided the Government in fighting famine. The coinage of silver in the year ending March 31, 1901, was over 150,800,000 rupees, yielding £3,000,000 of profits, all of which the Government intended to pay into the reserve fund if resources permitted. In March there were £3,913,000 in the coin reserve and in the currency reserve £6,957,000 of gold and 17,800,000 rupees of silver bullion against a note emission of 280,900,000 rupees. The currency in circulation was 238,400,000 rupees, having increased steadily since 1897. The gold reserve fund contained £800,000. The total reserves of gold were £7,757,000 and of silver 76,500,000 rupees, equal to £5,107,000.

The debt of British India in 1899 reached 2,467,361,700 rupees, of which 1,126,546,980 rupees was the amount of the permanent debt in India, 1,197,686,050 rupees that of permanent debt in England, and 143,128,670 rupees the amount of unfunded debt in India. The Indian Government, after au-

nouncing in the budget statement that it intended applying for a loan of £1,000,000 in England and one of 2 crores of rupees in India, decided in July to go to the London market for £3,000,000. The loan was offered, but found no takers, and was withdrawn. Of the proposed loan the Government required £1,730,000 to balance a credit taken for current expenses in 1901. A loan of 1 crore offered in India in August was subscribed several times over at a price exceeding 97, compared with 94 rupees given for the loan of 3 crores in 1900.

Defense.—The military forces in India in 1900 numbered, according to the estimates, 219,369 men of all ranks, comprising 17,896 artillery, 28,975 cavalry, 4,462 engineers, 167,248 infantry, and 788 miscellaneous officers. There were 56,889 troops in Bengal, 68,806 in the Punjab, 47,022 in Bombay, and 46,652 in Madras. The European army numbered 73,495 of all ranks, and for 1901 the number was fixed at 73,484, of whom 66,581 were effective in the spring of 1901. The volunteer corps in India had 31,083 men enrolled, of whom 29,371 were counted as effective. The imperial service troops maintained by feudatory princes numbered 17,664. A program for the improvement of the army, adopted in 1900, to be completed in 1903, includes a new transport and the registration of camels and other animals, Maxim guns for the cavalry and a part of the infantry, the manufacture of cordite and other munitions as well as army clothing in India, an increase of staff and other officers, and the rearmament of the native troops and the volunteers with 0.303 Lee-Enfield rifles and carbines. A rifle factory will be established in India. To fill the gaps caused by the absence of native troops garrisoned in Mauritius, Singapore, and Ceylon, 5 new regiments have been raised. In 1901 there were 1,500 native troops in Mauritius, 800 native and 2,100 British troops in Ceylon, 800 native troops in Singapore, 600 in Jubaland, 5,200 British troops of the Indian establishment in South Africa, and 16,300 native and 300 British troops in China, making a total of 7,600 British and 20,000 native troops. There are about 3,000 native commissioned officers in the native army. The Government has decided to open a military career for the sons of Indian princes and nobles by training a limited number in an imperial cadet corps and providing positions on the staff for such as are not called to duties in their own states and have the desire, perseverance, and aptitude to become British officers.

Commerce and Production.—The agricultural returns for 1899 deal with 545,301,175 acres in British India out of 732,238,346 acres surveyed in British and native territory. Of the area covered by the returns 64,753,597 acres were forest, 136,566,917 acres uncultivable waste, 106,292,719 acres waste fit for cultivation, 41,200,284 acres current fallows, and 196,487,658 acres under crops. Rice occupied 74,784,045 acres; wheat, 20,225,111 acres; other grains, 87,011,350 acres; sugar-cane, 2,755,887 acres; tea, 482,959 acres; cotton, 9,178,060 acres; oil-seeds, 12,167,001 acres; indigo, 1,013,627 acres; tobacco, 1,092,903 acres; jute, 1,690,739 acres; other fibers, 687,703 acres; coffee, 148,389 acres; various food crops, 6,164,086 acres. The area on which two crops were grown was 27,166,439 acres. There were 30,414,499 acres irrigated by canals, tanks, wells, etc., counting twice over land irrigated for two crops in the year. The total area under cultivation in India has grown from 194,000,000 acres in 1880 to 217,000,000 acres in 1901, the average income of the people from 18 to 20 rupees per capita, the income of the agriculturist being now 30 rupees, against 27 rupees in 1880. The area of reserved forests has been

extended from 17,705 square miles in 1877 to 84,666 square miles in 1899, of which 18,930 square miles were in the Central Provinces, 15,667 square miles in Burma, 14,888 square miles in Madras, 13,435 square miles in Bombay, 5,881 square miles in Bengal, 4,175 square miles in Berar, 4,005 square miles in the Northwest Provinces and Oudh, 3,537 square miles in Assam, 2,892 square miles in the Punjab, 238 square miles in Coorg, 205 square miles in Baluchistan, 156 square miles in the Andaman Islands, and 139 square miles in Ajmere.

There were 176 cotton-mills, with 37,540 looms and 4,456,177 spindles in 1899, having 149,895,850 rupees invested and employing 156,056 persons; 33 jute-mills and 1 hemp-mill, with 13,469 looms and 280,942 spindles, having 49,550,000 rupees invested and employing 95,351 persons; and 4 woolen-mills, with 578 looms and 22,506 spindles. The paper-mills, 8 in number, had 6,772,000 rupees of capital. The quantity of beer brewed in 1899 was 5,570,313 gallons. The quantity of coal obtained in 1899 from 221 mines, in which 72,267 persons were employed, was 4,932,808 tons, valued at 15,515,950 rupees. The imports of coal were 422,376 tons in 1900, and there were 287 coal-mines in operation which produced over 6,000,000 tons, valued at £1,339,700, twice the output of 1894. Nearly five-sixths of the total was produced in Bengal, where mining activity has been greatest in recent years. The number of people employed in the mines was 89,000, including 25,000 women. The production was sufficient for the railroads, mills, and steamers of India, and for the exportation of 541,000 tons to Ceylon and other countries. The high price of English coal, five times as high as that of the native, and the depression in cotton manufacturing caused the imports to fall to 127,000 tons in 1901. More than 20,000,000 hundredweight of salt was produced in British India in 1901. Over a third of the quantity was made by the Government and sold to the public. Rock salt is obtained in the Punjab and saline deposits are evaporated in Rajputana and Central India, but three-fourths of the salt is produced by solar evaporation on the coasts of Bombay and Madras. Bengal and Burma imported about 7,000,000 hundredweight. The total consumption was 26,250,000 hundredweight, a little more than was consumed in any previous year, yielding a revenue to the Government of £5,822,000, about 6d. per head of population.

Coffee is grown mainly in southern India, half the crop in Mysore and the rest in Coorg and other British territory. In 1900 the total area planted was 245,400 acres. The fall in prices since 1897 and disease and bad seasons have put a stop to fresh plantings. The quantity produced in 1900 was only half the crop of 1890. All the Indian coffee is exported, chiefly to Great Britain and France. Sugar became a fiscal problem in 1898 when a large importation of refined sugar began to come in from the glutted markets of Europe. Formerly Mauritius supplied all the foreign sugar that India required. In the year ending March 31, 1898, out of a total importation of 4,235,000 hundredweight, Germany sent 1,203,000, Austria-Hungary 946,000 hundredweight, Mauritius 1,406,000 hundredweight, China, Java, and the Straits Settlements 506,000 hundredweight, and other countries 174,000 hundredweight. In the following year imports fell to 3,765,000 hundredweight, of which quantity Germany sent 414,000 hundredweight, Austria-Hungary 1,064,000 hundredweight, Mauritius 1,794,000 hundredweight, China, Java, and the Straits Settlements 424,000 hundredweight, and other countries 69,000

hundredweight. For the benefit of Indian cultivation and the sugar-planters of Mauritius the Government imposed countervailing duties on bounty-fed sugar. Owing to heavy stocks and diminished consumption in 1900, the first year of the duties, the imports declined to 2,936,000 hundredweight, of which 60,000 hundredweight came from Germany, 778,000 hundredweight from Austria-Hungary, 1,417,000 hundredweight from Mauritius, 588,000 hundredweight from China, Java, and the Straits Settlements, and 93,000 hundredweight from other countries. In the year ending March 31, 1901, the imports of refined sugar were the greatest on record, amounting to 4,842,000 hundredweight, of which Germany furnished 402,000 hundredweight, Austria-Hungary 1,321,000 hundredweight, Mauritius 2,085,000 hundredweight, China, Java, and the Straits Settlements 832,000 hundredweight, and other countries 202,000 hundredweight. The imports of beet-sugar formed half the total in 1898; in 1901 they were still one-third. The Austrian Government met the duties by giving extra subsidies to steamers for carrying sugar, and the steamship company has contracted to carry 30 per cent. more sugar in 1902. A bad crop in India in 1900 was one of the causes of the large imports in 1901, and improved methods of cultivation have enabled Mauritius to compete with European producers on more even terms. The benefit the sugar cultivators of that colony and those of the eastern countries of Asia receive from the countervailing duties is nevertheless reflected in the figures, although it can not be accurately measured. The Government has benefited by obtaining a larger revenue from sugar imports, £350,190 in 1901 against £142,150 in 1899. The effect on Indian production will take time to develop. The natives are acquiring a liking for refined sugar, although the coarse native product in 1900 was sold dearer than imported white sugar. Improvement in the selection and cultivation of cane and in the extraction and cleansing of the sugar has yet to be introduced in India, which is one of the greatest cane-growing countries in the world, having nearly 3,000,000 acres under sugar; but the ordinary yield is only 1 ton per acre, compared with 3 tons in Barbados and 4 tons in Java. Even with this small yield India produces 17 times as much as she imports. The extension of the area of sugar-cane would not be profitable until crude and wasteful methods of production are changed. A commission was appointed to examine the question of sugar as an alternative or auxiliary crop for the indigo planters of Behar. The commission recommended cultivation in accordance with modern scientific agriculture, with central crushing-mills furnished with evaporating pans and centrifugal apparatus, central refineries also; if capital were put into these modern appliances, railroad rates reduced, and an agency for distribution and sales organized, a profit of from 50 to 80 per cent. was foreseen at present prices, and Behar alone could produce 1,320,000 hundredweight. Direct aid from the Government to planters was not advised, but in an experimental agricultural station the improved methods could be demonstrated, the best varieties of cane discovered, and various other crops tried. India with modern methods could produce nearly twice as much sugar as at present, and, instead of importing, could export great quantities as in former times. Indigo supplanted sugar in Behar about 1840. This is an ancient crop in India, but the industry has died away and been revived several times. Europe in the seventeenth century refused to import more indigo in order to protect woad, and when Indian

dye came into favor again the West Indies in the following century took away the trade until the East India Company took it in hand and placed it on its former footing. European planters with capital and enterprise built up the industry now carried on in Behar, and during the nineteenth century the best Indian indigo had no competitor except the Javan product. It is an expensive crop to raise, and bad seasons bring heavy losses which must be made up by large profits in good years. Bankruptcy has been the lot of a large proportion of the indigo planters, who have had to contend in recent times, not only with the vicissitudes of the seasons, but with the competition of substitutes. The cheap alizarin dyes checked the demand for all but the best indigo, but did not cause a decline. Exports were larger in the last quarter of a century than in the previous one. The record year was 1896, when 187,000 hundredweight was exported. Poor seasons have followed, and yet the price has gone down from 267 rupees a maund in that year to 192 rupees in 1900, when the export was only 111,000 hundredweight. The indigo acreage, which averaged 1,406,000 acres between 1894 and 1899, was reduced to 1,027,000 acres in the latter year, and 964,000 acres in 1900. A new substitute for natural indigo has come into the market which threatens the planting industry with extinction. German chemists have produced real indigo by synthesis, using as the basis naphthalin, a coal-tar product of which the supply is ample. This is treated with sulfuric acid, which is reconverted and used over again indefinitely, and there are valuable by-products. The synthetic dye, known as indigo pure, is made in a factory at Ludwigshafen, in which £900,000 has been invested, extending it so that as much can be made every year as a quarter of the whole acreage in Behar can yield. Indigo pure is produced in unvarying quality, essentially superior to the best of natural indigo. Dyers like it, for they pay 20 per cent. more for it than for Indian indigo because the results are always uniform. The colors differ slightly from those of the natural dye, but they please the public taste equally well. The Behar commission concluded that indigo can be grown at a cost of 135 rupees a maund instead of 170 rupees. The indigo planters, conscious that they are engaged in a life-and-death struggle, resolved to adopt all the improvements which their own and the Government's investigations show to be useful, to endeavor to get 50 to 100 per cent. more from the acre by the use of superphosphates and other artificial manures, to plant sugar, oil-seeds, and tobacco as rotation crops, to extract 25 per cent. more dye by oxidizing the decoction with compressed air, and to plant as much as they can and send a great quantity of indigo into the market, expecting only small profits but hoping to discourage the Baden company by underselling the artificial indigo. The Bengal Government has granted 50,000 rupees a year for scientific investigations. The Behar commission was not as sanguine as the indigo planters' association that they can save their trade, which has been worth £1,500,000 a year. The commission considered the future of indigo precarious in spite of the improved methods lately introduced, and that the competition of synthetic indigo will at all events prevent any increase in the price of vegetable indigo and will affect most seriously the finest and most expensive, which is that of Behar, and cause a reduction in price which will hardly clear the planter in a good season, while in a bad season it will be ruinous.

The total value of imports by sea in the fiscal year

1900 was 962,781,650 rupees, showing an increase of 6.99 per cent. over the previous year. The total value of exports was 1,170,397,092 rupees, a decline of 2.64 per cent. from the value for the previous year, which showed an increase of 14.73 per cent. over the exports for 1898, which were the lowest in amount for many years owing to famine and plague, having fallen 3.80 per cent. below the figure for 1897, which from the same causes was 8.16 per cent. lower than the total for 1896. In the total value of imports for the year ending March 31, 1900, merchandise amounted to 753,044,805 rupees and treasure to 209,736,851 rupees, while exports of merchandise were 1,090,833,216 rupees and exports of treasure 79,563,876 rupees. Excluding Government stores and Government treasure, the imports were 707,118,634 rupees of merchandise and 209,585,132 rupees of treasure; total, 916,703,766 rupees; and the exports were 1,089,761,873 rupees of merchandise and 79,500,405 rupees of treasure. Of the exports of merchandise 1,056,836,960 rupees were products of India and 32,924,912 rupees were reexports of foreign merchandise. Of the total imports on private account, including treasure, 353,644,924 rupees were imported into Bengal, 49,193,964 into Burma, 60,822,672 rupees into Madras, 409,153,249 rupees into Bombay, and 43,888,956 rupees into Sind, and of the exports, excluding Government stores and treasure, 506,593,287 rupees in value, went out of Bengal, 101,879,290 rupees out of Burma, 120,621,320 rupees out of Madras, 376,191,605 rupees out of Bombay, and 63,676,778 rupees out of Sind. Of the total imports of bullion and specie on private and Government account 114,487,959 rupees were gold and 95,248,892 rupees silver, and of the total exports of treasure 20,081,962 rupees were gold and 59,481,914 rupees silver. Among the imports of merchandise in 1900 the value of live animals was 3,034,933 rupees, and among the exports 2,007,156 rupees; imports of articles of food and drink were 92,367,801 rupees, and exports 303,778,416 rupees; imports of hardware and cutlery were 15,902,921 rupees, and exports 167,431 rupees; imports of metals were 25,419,034 rupees, and exports 1,869,083 rupees; imports of machinery were 25,419,034 rupees, and exports 3,723 rupees; imports of railroad materials were 27,770,780 rupees, and exports 101,433 rupees; imports of drugs and chemicals were 19,314,865 rupees, and exports 123,620,111 rupees; imports of oils were 19,314,865 rupees, and exports 123,620,111 rupees; imports of raw materials for manufactures were 36,895,579 rupees, and exports 408,855,807 rupees; imports of yarns and textile fabrics were 325,803,874 rupees, and exports 149,250,156 rupees; imports of apparel were 14,643,066 rupees, and exports 1,597,207 rupees; imports of all other articles were 64,896,509 rupees, and exports 56,899,957 rupees. Of cotton manufactures the value of 294,521,259 rupees was imported; of metals, hardware, and cutlery, 62,710,471 rupees; of oil, 34,261,722 rupees; of sugar, raw and refined, 33,766,299 rupees; of railroad material and rolling-stock, 27,770,780 rupees; of machinery, 25,419,034 rupees; of woolen goods, 17,580,018 rupees; of silk, raw and manufactured, 17,059,193 rupees; of provisions, 16,882,483 rupees; of liquors, 15,974,773 rupees; of clothing, exclusive of hosiery, 14,643,066 rupees; of chemicals and drugs, 12,881,273 rupees; of spices, 9,165,229 rupees; of coal, 8,102,136 rupees; of glass, 7,666,515 rupees; of grain and pulse, 7,269,930 rupees; of dyes and tanning substances, 6,433,592 rupees; of salt, 6,119,955 rupees; of paper, 4,113,201 rupees; of umbrellas, 2,730,307 rupees. The exports of rice were 130,970,471 rupees in value; of hides

and skins, 104,628,753 rupees; of oil-seeds and other seeds, 100,995,284 rupees; of raw cotton, 99,250,646 rupees; of tea, 90,921,120 rupees; of cotton manufactures, 82,741,246 rupees; of opium, 82,037,148 rupees; of raw jute, 80,716,465 rupees; of jute manufactures, 62,643,495 rupees; of wheat, 39,094,963 rupees; of indigo, 26,925,107 rupees; of coffee, 14,847,146 rupees; of wool, 13,563,745 rupees; of gum lac, 11,366,597 rupees; of timber and wood, 10,869,202 rupees; of oils, 8,686,481 rupees; of raw silk and cocoons, 6,986,106 rupees; of provisions, 6,170,586 rupees; of spices, 5,482,956 rupees; of saltpeter, 3,842,933 rupees; of sugar, raw and refined, 3,374,305 rupees; of woolen manufactures, 2,532,550 rupees; of silk manufactures, 1,289,018 rupees. Of the exports of rice the value of 77,334,186 rupees came from Burma, 41,553,510 rupees from Bengal, and 12,082,775 rupees from Madras, Sind, and Bombay together. Bengal furnished 51,553,555 rupees' worth of opium, and Bombay 30,483,593 rupees. Of the wheat 20,629,634 rupees in value came from Sind, 8,786,208 rupees from Bengal, and 9,679,110 rupees from Bombay. Of the indigo the value of 16,350,979 rupees came from Bengal, 8,756,048 rupees from Madras, and the rest from Bombay and Sind. Of cotton the value of 68,593,628 rupees was grown in Bombay, 14,088,908 rupees in Madras, 9,415,883 rupees in Sind, 5,051,459 rupees in Bengal, and 2,100,768 rupees in Burma. Bombay raised 46,325,596 rupees' worth of seeds, Bengal 40,423,177 rupees, Sind 10,343,228 rupees, and Madras and Burma the rest. The imports from and the exports of Indian products to the principal countries in the year ending March 31, 1900, were of the following values in rupees:

COUNTRIES.	Imports.	Exports.
Great Britain.....	487,531,911	208,898,872
China.....	15,963,866	140,654,964

The foreign trade of Calcutta in 1900 amounted to 792,396,572 rupees, that of Bombay to 564,688,280 rupees, that of Rangoon to 121,767,575 rupees, that of Karachi to 105,504,708 rupees, that of Madras to 96,534,803 rupees, and the port of Tuticorin had a trade of 20,440,157 rupees. Of the total value of merchandise imports 600,744,738 rupees came through the Suez Canal, and of the exports 652,643,770 rupees went by that route. The coasting-trade in 1900, exclusive of Government stores and treasure, amounted to 809,399,247 rupees. The imports of merchandise by the land frontiers in 1900 amounted to 61,631,387 rupees in value, and the exports to 51,068,299 rupees. Of the imports 21,739,223 rupees came from Nepal, 10,837,984 rupees from Kashmir, 6,488,729 rupees from the Shan States, 4,798,405 rupees from Bajaur, 4,324,772 rupees from Kandahar, 2,594,207 rupees from Karenni, 1,870,547 rupees from Cabul, 1,618,416 rupees from Tibet, 1,671,089 rupees from Zimme, 1,132,836 rupees from western China, 814,-

866 rupees from Khelat, 640,441 rupees from Lus Bela, 487,764 rupees from Ladakh, and 303,315 rupees from Siam. Of the exports the value of 14,970,841 rupees went to Nepal, 8,051,278 rupees to Kashmir, 7,535,423 rupees to Bajaur, 7,379,706 rupees to the Shan States, 2,818,412 rupees to Kandahar, 2,226,352 rupees to western China, 1,278,856 rupees to Tibet, 900,944 rupees to Zimbe, 625,822 rupees to Khelat, 268,678 rupees to Siam, 240,293 rupees to Ladakh, 161,358 rupees to Lus Bela, and 81,886 rupees to Karenni.

The total imports of merchandise in 1901 were valued at £53,930,000, and of treasure at £6,900,000; exports of merchandise at £69,710,000, and of treasure at £2,140,000. The imports of cotton yarn were £1,659,477 in value; of gray piece goods, £9,567,467; of white goods, £4,070,458; of colored cottons, £3,857,151. Gray goods come in increasing quantities from the United States, and French and German chintzes and prints are supplanting the English. Some American and Egyptian cotton is now imported for the spinning of finer yarns in India. Imports of woolen goods are increasing, and Germany has obtained some of this trade, while half the imports of apparel come from Austria, France, and other Continental countries. Belgium is outstripping England in important iron and steel manufactures, and Germany is encroaching on the British hardware and cutlery trade. Imports of machinery and utensils are received by preference from the United States. Imports of kerosene have been at a standstill owing partly to supplies from the Burmese wells, but mainly to poverty consequent upon famine. Whereas the United States furnished all the oil a few years ago, now the cheaper Russian oil is almost the only kind wanted.

The exports of wheat fell off from 19,520,000 hundredweight in 1899 to 9,704,000 hundredweight in 1900, and 50,000 hundredweight in 1901. The exports of rice, two-thirds of which come from Burma, reached 31,345,000 hundredweight in 1901, and but for famine prices in India a larger quantity would have been shipped. The area of cultivation in Burma is being extended to supply the increased demand in Bengal, which consumes the whole of its own great crop. The demand for jute all over the world is increasing, and the crop area in Bengal is consequently being enlarged. The jute exports in the year ending March 31, 1901, were 12,414,550 hundredweight, valued at £7,245,170, an increase of 28 per cent. in quantity and 35 per cent. in value. The capacity of the jute-mills has been enlarged, and the exports of jute manufactures reached the value of £5,243,000. The United States took a larger quantity of raw jute and half the product of jute cloth, but fewer bags. The cotton-crop was poor, and exports of raw cotton fell from 4,373,500 hundredweight in 1900 to 3,575,700 hundredweight. The crop in 1900 was only 760,000 hundredweight, owing to drought; in 1901 the acreage was diminished, and the crop was 2,032,000 hundredweight. Japan, which took American cotton in 1901, is expected to return to the cheaper product of Bombay, which has deteriorated in quality because the ryots use poor seed, but the industry is to be improved with Government encouragement by the selection of seed, better processes of cleansing and packing, and the manufacture of oil and oil-cake. The cotton-manufacturing industry in Bombay has been depressed since 1896, and many mills ceased working. The production of yarn was only 342,780,000 pounds in 1901, compared with 501,680,000 pounds in 1900. Japanese competition is the most serious difficulty, but man-board decides that it is dangerous or unhealthful.

per cent. of American or Egyptian cotton with the domestic staple and are beginning to see better times. The export of £15,170,000 worth of hides and skins in the last two famine years, against £10,200,000 worth in the famine years 1896 and 1897, is an indication of the effects of the drought in destroying cattle. The United States took 83 per cent. of the raw, Great Britain the bulk of the dressed and tanned hides. Exports of opium in 1901 were 69,708 chests, valued at £6,303,625, a temporary improvement due to circumstances affecting the Chinese crop. The exports of indigo declined still further in 1901 to 102,000 hundredweight, valued at £1,423,987, 27 per cent. below the value exported in the previous year. The exports of tea have grown from 157,470,672 pounds in 1899, valued at £5,363,203, to 175,038,127 pounds, valued at £6,061,408 in 1900, and 190,305,490 pounds, of the value of £6,367,287 in 1901, showing an increase of 21 per cent. in total weight in two years, but a decline in prices due to excessive production and to the inferior quality of tea produced, especially in areas just brought under cultivation. The abundant crop of 1901, which showed continued deterioration in quality, served to further disorganize the glutted market, which received a staggering blow when England enhanced the tea duty. The exports of oil-seeds, owing to bad crops, fell from 19,279,909 hundredweight in 1899 to 10,997,947 hundredweight, and the value from £7,898,130 to £6,009,357, Russian and Argentine competition causing a fall in price, not in line, the quantity of which decreased 44 per cent., and that of rape-seed 50 per cent., while in castor-seed and poppy-seed the decline was slight.

The imports of gold in the year ending March 31, 1901, were £7,932,000, and exports £7,370,060, of which £4,500,000 were on Government account. The imports of silver were £8,452,000, of which £5,391,000 were for the Government, and the exports were £2,113,000.

Navigation.—The number of vessels in the foreign trade entered during the year ending March 31, 1900, at ports of British India was 4,395, of 4,470,348 tons, of which 2,299, of 3,650,004 tons, were British; 571, of 72,690 tons, were British Indian; 670, of 691,897 tons, were foreign; and 855, of 55,757 tons, were native. The number cleared was 4,133, of 4,157,138 tons, of which 2,182, of 3,389,763 tons, were British; 528, of 68,596 tons, were British Indian; 602, of 644,723 tons, were foreign; and 821, of 54,056 tons, were native. Of the vessels entered 643, of 1,662,030 tons, were steamers that passed through the Suez Canal, and of those cleared 875, of 2,132,830 tons. The number of vessels entered with cargoes in the interportal trade was 101,832, of 10,534,054 tons; cleared, 96,053, of 10,674,285 tons. The number of vessels built in British India during the fiscal year 1900 was 62, of 2,058 tons; the number first registered was 103, of 12,558 tons.

Railroads, Posts, and Telegraphs.—The length of railroads in operation in India in 1900 was 23,763 miles, of which 5,724 miles were state lines worked by the Government, 11,364 miles were state lines worked by companies, 2,612 miles were lines worked by guaranteed companies, 1,415 miles were lines worked by assisted companies, 1,327 miles were lines belonging to native states leased to companies, 156 miles were lines belonging to native states worked by the Indian State Railroad Agency, 1,091 miles were lines owned and worked by native states, and 73 miles were foreign lines. The capital expended on Indian railroads, including unfinished lines and surveys, amounted to the end of 1899 to 3,111,685,620 rupees, of which 1,808,-

431,230 rupees were in the Government railroads, 443,002,150 rupees in the lines built by the state and leased to companies, 523,116,640 rupees in the guaranteed railroads, 154,825,880 rupees in the lines of assisted companies, 156,719,150 rupees in the lines belonging to native states, 17,590,320 rupees in the lines belonging to foreign governments, 2,897,540 rupees in coal-mines, and 5,102,710 rupees were the cost of surveys. The capital raised by the guaranteed companies amounted to £47,237,405 sterling, and the capital raised for state lines leased to companies was £29,892,027. The gross receipts of all the railroads in 1899 were 294,318,280 rupees, compared with 274,642,350 in 1898. The number of passengers carried in 1899 was 162,944,867, paying 92,258,550 rupees; tons of freight, 40,598,520, paying 192,374,860 rupees. The operating expenses were 140,194,090 rupees, being 47.63 per cent. of the gross earnings. The net earnings amounted to 154,124,190 rupees, paying 5.36 per cent. on the capital of lines in operation. On May 1, 1901, the total length of open railroads was 25,125 miles, 4,037 miles having been added since the beginning of 1898. The number of passengers rose to 175,000,000 in 1900, and the freight traffic to 43,500,000 tons. The Government for the first time realized a surplus revenue over expenditure, which amounted to 8,375,000 rupees. Expenditure is still heavily weighted by the terms of the contracts with guaranteed companies, whose lines will gradually be taken by the state as these contracts expire. One important line, the Great Indian Peninsular, was absorbed by the Government in 1900.

The number of letters, postal cards, and money-orders that passed through the post-office of British India during the year ending March 31, 1899, was 431,012,691; newspapers, 32,122,502; parcels, 3,040,236; packets, 23,039,424. The revenue was 19,140,670 rupees; expenses, 17,254,130 rupees.

The telegraph-lines belonging to the Indian Government had at the end of 1899 a length of 51,769 miles, with 160,650 miles of wire. The number of paid despatches during the fiscal year was 5,448,600; receipts, 10,808,200 rupees; expenses, 10,269,600 rupees.

Legislation and Government.—The reforms with which Lord Curzon seeks to mark his administration are a sound frontier policy which is not the policy of inaction followed by Lord Lawrence, nor the forward policy of later viceroys; the constitution of the best form of administration for the frontier districts; the remedying of the abuse of frequent transfers of civil officers under the rules regarding leave, good administration being impossible without continuity, intelligent administration with local knowledge or popular administration without personal interest, hence a reform of the leave rules will tend greatly to mitigate the evils resulting from the constant shifting of officers before they have acquired the confidence of the people; the correction of the abuse of interminable writing which divorces the officer from his proper work, the tyranny of the pen being more to be feared in India than tyranny by the executive authority; the reform of the currency system, which seems already to have brought stability; the railroad policy, railroads being the most unifying agency in India and a blessing to the country, for arguments that they carry off food supplies and raise prices involve a fallacy; irrigation that will insure for each province the sources of water-supply best suited to its demands, which the Government is ready to proceed with as soon as engineers investigate and report whether it shall be by canals, tanks, or wells; the remedying of agricultural indebted-

ness, a problem which meets the Government everywhere in increasing volume and seriousness, a beginning being made with the Punjab land alienation bill which a part of the native press has censured, although it was based solely on considerations for the public interest; the reduction of the telegraphic tariff between India and Europe to 1s. a word, which will probably come when Great Britain is mistress of her own principal lines of cable communication; the new rules to govern the relations between soldiers and natives, in framing which the civil and military authorities were in perfect accord, their object being to draw closer the bonds of friendly feeling between the two races.

The report of the Indian Famine Commission approves the basis of the famine code of 1880 and holds that the more liberal wages and freer extension of gratuitous relief recommended by the commission of 1898 tended toward extravagance, and the object of saving life and giving protection from extreme suffering may be better secured if care be taken to prevent the abuse and demoralization which are the consequence of ill-directed and excessive distribution of charitable relief. The last famine resulted in the loss of 4,000,000 head of cattle. The expense of relief exceeded £10,000,000, and in May, 1901, the Government still had 400,000 persons on its hands. To induce people to return to their ordinary vocations the relief commission under Sir Antony Macdonnell raised their tasks and ceased the distribution of gratuitous relief to the able-bodied after the break of the monsoon. The early monsoon in 1901 was not abundant, though sufficient to enable agricultural operations to be carried on; the late monsoon was almost a failure. The number of persons who died during the famine year in British India was 1,000,000, three-fourths of them in the Bombay Presidency, and in native states 250,000. The terrible mortality in Gujerat was partly due to an epidemic of cholera, that in Ajmere to virulent autumnal fever. The mortality both from cholera and starvation could, however, have been kept within bounds if the local officers had distributed gratuitous relief as soon as the existence of famine was recognized and had seen that all received it who were entitled to it when it was distributed. The liberal distribution of relief saved a great number of lives in the Central Provinces and kept the rate of mortality low in the autumn. Village relief will in the future be the chief means of using famine labor. The Government will not adopt a lower scale of wages unless the local administrations concur. The commission does not advise the Government to relinquish any of the land revenue, which is considered low compared to the share of the produce to which the Government is entitled by the tradition of the country. It is estimated at from 5 to 7 per cent. of the average value of the crops, exceeding the latter figure only in some parts of the Punjab and in the richer districts of Bombay, where 20 per cent. is collected by the Government. In seasons of deficient crops the people have to borrow to pay their land tax in cash because they spend their income in favorable seasons. Elasticity in the collection of land revenue is recommended, also the establishment of agricultural banks, the encouragement of land improvements, expenditure of state funds in irrigation works, and attention to measures for increasing the knowledge and thrift of cultivators. The Government has already studied the development of village credit associations, and a wide extension of irrigation works. The question of irrigation extension has been studied in each province by engineers spe-

cially commissioned for the purpose. The census shows a large increase in population wherever irrigation canals exist. Sir Colin Scott-Moncrieff has been placed at the head of a commission that will lay down rules for the interlacing, encouragement, and control of irrigation works. Of the existing large productive works 22 realized in 1901 a net revenue of 9.52 per cent. on the capital investment, while 13 others yielded only 0.79 per cent., the average of all being 7 per cent. There was an increase of 750,000 acres in the irrigated area during the year. The great Jehlum Canal, opened in October, 1901, irrigates a vast tract, part of which has lain waste, between the Jehlum and Chenab rivers. Other large projects are being carried out in the Punjab. Since irrigation was undertaken by the Government the works have yielded a surplus revenue of nearly £10,000,000 aside from their economic value and the increased land revenue obtained from waste tracts brought under cultivation. The famine relief officers were handicapped by having no programs of public and village works. Advances for the construction of temporary and the repair of permanent wells and village improvements were not made at a sufficiently early stage or were inadequate in amount. The test works for gaging the existence or the pressure of distress were not appreciated, and in Bombay were converted too late into regular relief works. Payment by results is found to be a better method on relief works than a minimum wage suggestive of Government employment.

The bubonic plague appears to have become endemic throughout the greater part of India. When the fall rains of 1901 began in August the mortality rose to between 1,500 and 2,000 a week. The number of deaths reported from the first visitation in the winter of 1896 to March 31, 1901, was 480,000, and the unreported deaths would make the total over 600,000 at the least computation. The disease has entered nearly a tenth of the villages of India. In the winter of 1900 there were widely extended outbreaks in the Behar districts of Bengal and in the Northwestern Provinces and recrudescences in western India and elsewhere. Little has been learned regarding the causation of the plague or the manner in which it spreads. The compulsory methods adopted by the Government when the pestilence first appeared, which drove the people to conceal cases and to flee from Bombay in all directions, carrying the germs of infection into the country districts, have been abandoned, and now the people often cooperate with the sanitary authorities and voluntarily adopt preventive precautions. They resort in increasing numbers to the Haffkine antiplague serum inoculation, which the plague commission approve as not injurious to the general health of the patient and generally, though not invariably, affording protection for five or six months.

A mines bill which has been under discussion for two years was intended to prohibit the labor of children and to restrict and regulate the employment of women. The mine-owners contended that this would interfere with the family system of labor which has obtained from time immemorial. It was regarded as a measure forced upon India in fulfillment of pledges undertaken by the English Government at the Berlin Labor Conference of 1890, if it was not indeed designed to cripple the infant coal-mining industry of India for the benefit of English mine-owners. The bill was modified so as to permit the employment of women and children except in mines where the Government after consultation with a mining board decides that it is dangerous or unhealthful

A labor bill compelling tea-growers to pay coolies higher wages in the second and third years of their engagement was made operative only after two years in view of the depressed state of the tea industry, which is so critical that nearly three-fourths of the companies have passed their dividends. The construction of the great Gokteik Viaduct, 2,260 feet long and 320 feet high, in the railroad from Mandalay into the Shan States by an American company drew forth but few protests because no British contractor was willing to build the bridge in less than twice the time or for less than twice the price. American engines were ordered for Indian railroads about the same time, and American rails were imported. The railroad in Upper Burma was begun with the object of tapping the trade of Yunnan, but although a French line is being built into that Chinese province the British line is not likely to go beyond Thibaw, half-way to the frontier. Development in another direction is being followed up by means of railroads connecting the ports of Bassein and Moulmein with Rangoon. The mountainous frontier of Yunnan can not be crossed by a railroad except at enormous expense. The Kachin tribes which inhabit these mountains are constantly at war among themselves. The Chinese Kachins make raids across the frontier, and the Kachins of Burma have applied in vain at Mandalay for protection.

The northwestern frontier districts beyond the Indus inhabited by Pathan tribes, the scene of all the costly and indecisive frontier wars, the hill states and tribes which were accounted a part of Afghanistan until the British Government first declared them independent and then proceeded to conquer them and annex them to India, have been detached from the Punjab and constituted into a separate province under the direct control of the Central Government. A new policy toward the frontier tribes was inaugurated when Lord Curzon arrived in India and ordered the withdrawal of the advanced posts. The place of the British troops was taken by tribal levies, and the British posts commanding Samana, Tochi, and Wana were still held in the spring of 1901 until the Pathan recruits could be organized. The Northwest Frontier Province, of which Col. Deane was appointed chief commissioner in October, embraces the four districts of the Punjab lying beyond the Indus, viz., Peshawar, Kohat, Bannu, and Dera Ismail Khan, with the tribal country beyond their limits, Hazara, and also the political agencies of Dir, Swat, Chitral, the Khaibar, the Kuram, Tochi, and Wana. Lord George Hamilton was induced after a long correspondence to agree to Lord Curzon's plan of forming a frontier province, having proposed before Lord Elgin retired from the viceroyalty in 1899 that the commissioner at Peshawar should be under the Government of India as regards political relations with the frontier tribes while remaining under the Punjab Government as regards administrative functions, a proposal that frontier administrators condemned as being likely to create confusion and friction. The Northwest Frontier Province was started on Nov. 1. Meanwhile there was a disturbance among the Pathan tribes on the unsettled border of Waziristan. The Mahsuds and the Darwesh Khel Waziris have raided their neighbors for years and have several times come into collision with the British authorities. Fines have been imposed, but they would not pay, and to enforce them proved difficult and expensive. The experiment of trying to rule the wild tribes by the Sandeman system, which has succeeded in Baluchistan, the method of subsidizing the head

men and raising local militia for the preservation of order, proved a failure because neither head men nor local militia, though willing to take the pay of the Government, would lift their hands to restrain, much less to punish their fellow tribesmen, for if the tribal levies shot at their brethren they committed a grave offense against the Pathan code of honor and invited blood feuds against themselves and their relatives. On Dec. 1, 1900, a new policy was put into operation. The tribe which did not pay fines due was subjected to a stringent blockade. The Mahsud tribe being delinquent, all Mahsuds residing in British territory were compelled to return to their homes, and trade or intercourse with Mahsud territory was prohibited. The stoppage of subsidies and the blockade caused much distress. The tribe surrendered firearms and paid three-fourths of the fine of a lakh of rupees, giving up their cattle; but when the Government insisted that the remainder must be paid in cash, they could not or would not raise the money, and hostilities broke out. The Mahsuds began to raid across the border in July. They attacked the Sikh garrison at Jandola and different militia posts, compelling the one at Kashmir Kar, in the Gomal pass, to surrender. The military authorities were informed of the impending hostilities before the outbreak, and a force of Sikhs advanced to block the Sarakwai passes without much success. Raiders wrecked the telegraph-line and attacked military detachments and parties of civilians wherever they were found traveling through the country.

The efforts of the Russians to establish relations with Tibet drew the attention of the Indian Government from the northwestern to the north-eastern frontier. Trade between Tibet and India through Ladakh, in Kashmir, had declined or passed into the hands of the French and Germans, who sent imitation Kashmir shawls into Tibet. The attempts formerly made to establish political relations with the Lamas by opening the route through Sikkim failed, but the trade secured by the opening of a market in 1890 at Yatung, on the Tibetan frontier, has grown slowly, amounting to 823,000 rupees for imports and 963,000 rupees for exports in 1899, the exports to Tibet consisting largely of German goods, the imports being coarse wool to be woven into carpets and blankets in England and the United States, musk, and fine wool, lambskins, and woolen cloth destined for China, the trade being carried on by Chinese merchants. In case of political developments in Tibet the Indian Government is prepared to send troops into the Chinese dependency both by the Sikkim route, which has been reconnoitred, or through Kashmir or Nepal.

INDIANA. (See under UNITED STATES.)

IOWA. (See under UNITED STATES.)

ITALY, a kingdom in southern Europe. The throne is hereditary in the line of Savoy by male descent in the order of primogeniture. The reigning King is Vittorio Emanuele III, born Nov. 11, 1869, only son of Umberto I of Italy and Queen Margherita, daughter of Prince Ferdinando of Savoy. King Vittorio, who succeeded to the throne in consequence of the assassination of his father on July 29, 1900, married, on Oct. 26, 1896, Princess Helena, daughter of the reigning Prince of Montenegro. The legislative authority is vested in the Parliament, consisting of a Senate, containing 334 members in 1899, who are nominated for life by reason of public services or eminence in science, literature, or other pursuit tending to the benefit of the nation, and a Chamber of Deputies containing 508 members, 1 to 57,000 of

population, elected by all adult male citizens who can read and write and who pay 20 lire of direct taxes or occupy land or a tenement or place of business of a certain minimum renting value. Soldiers in active service have no votes, and public officials, excepting ministers and under-secretaries of state, certain superior functionaries, military and naval officers, and clergymen with cures, are not eligible. The duration of Parliament, unless previously dissolved, is five years.

The Cabinet constituted on June 24, 1900, and holding office at the beginning of 1900, was composed as follows: President of the Council and Minister of the Interior, Giuseppe Saracco; Minister of Foreign Affairs, Marchese Visconti Venosta; Minister of War, Lieut.-Gen. Conte Coriolano Ponna di San Martino; Minister of Marine, Vice-Admiral Constantini Enrico Morin; Minister of Justice, E. Gianturco; Minister of Finance, B. Chimirri; Minister of the Treasury, G. Rubini; Minister of Public Works, A. Branca; Minister of Public Instruction, N. Gallo; Minister of Agriculture, Industry, and Commerce, P. Carcano; Minister of Posts and Telegraphs, A. Pascolato.

Area and Population.—The area of Italy, as determined by a recent Government survey, is 110,646 square miles. The population as determined by the census of Feb. 9, 1901, was 32,045,404, an increase of 4,000,000 since the census of Dec. 31, 1881. The number of marriages in 1899 was 235,665, against 219,597 in 1898; of births, 1,088,558, against 1,070,074; of deaths, 703,393, against 732,265; excess of births, 385,165, against 337,809. The number of emigrants in 1899 was 308,339, of whom 162,899 went to other countries in Europe, 63,156 to the United States, 46,648 to the Argentine Republic, Uruguay, and Paraguay, 26,574 to Brazil, 4,566 to northern Africa, 1,267 to Central America, 1,021 to Canada, 860 to parts of America not specified, 408 to Chile and Peru, and 940 to other countries. Of the total number of emigrants 20,911 went from Piedmont, of whom 12,013 were temporary; 3,473 from Liguria, 159 of them temporary; 19,266 from Lombardia, 12,449 declaring their emigration temporary; 114,228 from Liguria, 109,319 being temporary; 18,389 from Emilia, 14,885 being temporary; 15,409 from Toscana, 10,756 being temporary; 7,193 from the Marches, 1,784 of them temporary; 1,096 from Umbria, 760 of them temporary; 1,489 from Lazio, of whom 981 were temporary; 17,522 from Abruzzi and Molise, of whom 1,187 were temporary; 34,414 from Campania, of whom 7,572 were temporary; 3,653 from Puglie, of whom 662 were temporary; 8,906 from Basilicata; 17,713 from Calabria; 24,604 from Sicilia, of whom 4,443 declared their absence temporary; and 73 from Sardegna, of whom 61 were temporary; total 308,339, including 177,031 temporary emigrants. The population of the chief towns at the close of 1899 was: Naples, 544,057; Rome, 512,423; Milan, 492,162; Turin, 359,295; Palermo, 292,799; Genoa, 237,486; Florence, 216,051; Bologna, 158,975; Venice, 157,785; Messina, 156,552. The increase in population in twenty years as shown by the census was greatest in the Lazio, or Roman district, where it amounted to 17.5 per cent.; next greatest in Liguria, where the rate was 11.1 per cent.; in Sicily next, with an increase of 10.7 per cent.; and in Sardinia, with 8.2 per cent. increase.

Finances.—The budget estimate of revenue for the year ending June 30, 1901, was 1,726,421,692 lire. The ordinary receipts were estimated at 1,709,035,623 lire, and the extraordinary receipts at 17,386,069 lire. The ordinary expenditures were estimated at 1,628,951,044 lire, and extraor-

dinary expenditures at 101,361,498 lire; total expenditures, 1,730,312,542 lire. The revenue from railroads and state property was reckoned at 99,393,045 lire, of which railroads produced 86,576,200 lire, state property 11,260,235 lire, and various sources 1,556,610 lire; direct taxation, 479,276,500 lire, made up of 286,496,500 lire from income tax, 103,380,000 lire from the land tax, and 89,400,000 lire from the tax on buildings; taxes on transactions, 221,805,000 lire, including 67,900,000 lire from stamps, 61,500,000 lire from registration, 21,030,000 lire from the tax on railroad receipts, 37,000,000 lire from succession duties, 12,000,000 lire from the tax on operations of banks and commercial companies, 7,500,000 lire from the duty on mortgages, 8,000,000 lire from various concessions, 6,200,000 lire from mortmain revenues, and 675,000 lire from consular fees; customs, monopolies, and excise, 682,965,000 lire, of which 197,000,000 lire came from the tobacco monopoly, 75,500,000 lire from salt, 51,865,000 lire from octrois, 60,100,000 lire from duties on the manufacture of beer, spirits, mineral waters, gunpowder, and sugar, 67,500,000 lire from the lottery, and 232,000,000 lire from customs; public services, 100,417,697 lire, of which 64,000,000 lire came from the post-office, 15,300,000 lire from telegraphs, 7,200,000 lire from school fees, 5,909,000 lire from prisons, 1,460,000 lire from fines, 2,500,000 lire from assays, 1,900,000 lire from land registry, and 2,148,697 lire from various services; repayments, 23,642,182 lire; various departmental receipts, 26,586,500 lire; domains, 15,617,648 lire; interest on invested funds, 18,297,024 lire; communal contributions of Rome and Naples, 28,045,230 lire; miscellaneous receipts, 12,989,797 lire. Of the extraordinary receipts 4,103,113 lire came from recovery of debts, 589,671 lire from various effective sources, 151,307 lire were on account of railroad construction, 12,541,978 lire from movement of capital, 5,723,840 lire from sales of state property, and 6,818,138 lire from various other sources. The expenditures were 477,495,276 lire for interest on the consolidated debt, 60,356,135 lire for extinguishable debts, and 26,464,457 lire for the annuity for the purchase of railroads in northern Italy; 121,303,782 lire for interest on floating debt, including 15,949,005 lire on treasury bonds, 15,528,000 lire due to railroad companies, 81,264,261 lire on railroad guarantees, 4,363,400 lire on accounts current; and 4,199,116 lire for various floating liabilities; 16,050,000 lire for the civil list and appanages; 6,021,000 lire for pensions; 2,155,000 lire for the Senate and Chamber of Deputies; 9,947,912 lire for general expenses of the Ministry of the Treasury; 975,697 lire for various services; 3,500,000 lire for a reserve for unforeseen expenses; *recettes d'ordre*, 20,758,617 lire, including 18,297,024 lire for the service of the amortizable debt and 1,967,297 lire for interest; and 494,296 lire on account of domains; 23,089,542 lire for extraordinary expenditures of the Ministry of the Treasury; 29,131,713 lire for general expenses of the Ministry of Finance, including 9,068,286 lire for general administration, 12,577,000 lire for pensions, 1,505,300 lire for various services, and 5,981,127 lire for the cadastral survey; 156,882,818 lire for cost of collecting revenues and of monopolies, lotteries, etc.; 29,928,661 lire for expenditure *d'ordre*; 7,320,956 lire for extraordinary expenditures of the Ministry of Finance; 16,270,105 lire for the Ministry of Foreign Affairs, 16,246,105 lire being for ordinary and 24,000 lire for extraordinary expenses; 47,474,952 lire for the Ministry of Education, 46,572,158 lire being for ordinary and 902,794 lire for extraordinary expenses; 40,977,897 lire for ordinary and 21,798 lire

for extraordinary expenses of the Ministry of Justice; 71,190,336 lire for the Ministry of the Interior, 12,003,276 lire being for general administration, 7,705,000 lire for pensions, 1,001,012 lire for sanitary service, 16,420,895 lire for police, 27,897,970 lire for prisons, 949,460 lire for various services, 1,431,625 lire for expenditure *d'ordre*, and 3,721,097 lire for extraordinary expenses; 38,732,363 lire for ordinary and 51,456,333 lire for extraordinary expenditure of the Ministry of Public Works; 66,298,694 lire for the Ministry of Posts and Telegraphs, 65,922,178 lire being for ordinary and 376,516 lire for extraordinary expenses; 271,159,678 lire for the Ministry of War, 264,893,678 lire being for ordinary and 6,266,000 lire for extraordinary expenses; 122,384,671 lire for the Ministry of Marine, 117,408,191 lire being for ordinary and 4,976,480 lire for extraordinary expenses; 12,964,149 lire for the Ministry of Agriculture, Industry, and Commerce, 9,758,167 lire being for ordinary and 3,205,982 lire for extraordinary expenses. The ordinary revenue shows a surplus of 80,084,579 lire over ordinary expenditures, but the extraordinary receipts are 83,975,429 less than the extraordinary expenditures, giving a net deficit of 3,890,850 lire. The effective receipts are 26,634,783 lire in excess of the expenditure in the same category, while the account for the construction of railroads shows only 151,307 lire of receipts and 18,578,403 lire of expenditures, and in the movement of capital the expenditure exceeds receipts by 12,098,537 lire. The direct taxes in Italy are exceedingly high. The income tax is 20 per cent., and the full tax is collected on Government bonds, but in the case of incomes from trade and industry only half the income is assessed, nine-twentieths when it is derived from professions, three-eighths in the case of officials, and three-fourths when the income is derived from corporations. The tax on buildings is 12½ per cent. of the annual taxable value, which is two-thirds of the actual rental in the case of factories and three-fourths in that of dwelling-houses. The actual receipts of the treasury for the year ending June 30, 1901, were 1,685,174,500 lire, and expenditures 1,679,890,000 lire. The revenue had steadily expanded for four years. The national debt absorbs 48 per cent. of the entire revenue. The debt accumulated during the period of Italian unification, chiefly by taking over the debts of the component states, has been a heavy load. Prior to 1861 a debt of 3,500,000,000 lire existed. The greater part of the debt has been expended on railroads, roads, posts, and other productive works. A large share of this, however, was unjustly assumed in the railroad conventions of 1885, and wastefully contracted for electoral purposes between 1880 and 1886. The abolition of the grist tax and the imposition of a multitude of protective duties and other indirect taxes disturbed the equilibrium, and the military expenditures incurred in consequence of the French occupation of Tunis, as well as the normal charges assumed as a great power and a member of the Triple Alliance, brought on a period of deficits which greatly added to the debt from before the commercial crash of 1893 until the equilibrium was restored in 1896. The public debt in 1899 amounted to 12,256,198,652 lire. The interest in 1900 was 589,095,616 lire, of which 400,520,809 lire were paid on 5-per-cent., 59,059,902 lire on 4½-per-cent., 7,685,884 lire on 4-per-cent., and 4,408,530 lire on 3-per-cent. rentes; 12,178,697 lire on debts separately inscribed, bearing from 3 to 5 per cent. interest; 90,566,794 lire on various other debts, bearing from 3 to 6 per cent. interest; 11,050,000 lire on the floating debt; and 3,225,000

lire were the permanent annuity due to the Holy See. The annual sinking-fund amounted to 2,449,587 lire. The state property was estimated to be worth 4,655,900,500 lire, consisting of assets in the treasury to the amount of 729,975,304 lire, movable and immovable property, loans, and securities valued at 507,855,103 lire, property of an industrial nature estimated at 1,352,492,914 lire, military and naval property estimated at 1,402,372,779 lire, property used in the service of the state estimated worth 445,048,848 lire, and scientific and artistic material valued at 218,155,552 lire. The revenue from state property in 1899 was 84,048,921 lire from railroads, 1,728,538 lire from ecclesiastical property, 8,322,418 lire from fixed capital, 2,880,159 lire from canals, and 2,307,266 lire from various capitals; total revenue from capital, 99,287,102 lire. The national debt on June 30, 1900, amounted to 12,881,500,000 lire. The Italian rentes were formerly held largely abroad, but in recent years Italians have absorbed most of the foreign holdings.

The Army.—The military law of June 28, 1897, provides that young men drawn by lot for service remain two or three years under arms, except carabinieri and non-commissioned officers, who stay with the army five years. Men of a second category are called out for training two to six months, and are then attached to the permanent army eight or nine years with unlimited leave of absence. Men of a third category are inscribed in the territorial militia, receiving thirty days of training. In 1898 there were 361,654 recruits examined at the completion of their twentieth year, of whom 84,584 were put back, 72,495 were found unfit for service, 106,943 were assigned to the first category, 233 to the second, and 97,399 to the third. The permanent army in June, 1899, had under arms 13,643 effective officers, 275 officers on half pay, 23,749 carabinieri, 119,175 infantry, 14,072 bersaglieri, 11,665 Alpine troops, 9,953 men in the military districts, 24,328 cavalry, 33,284 artillery, 8,994 engineers, 1,438 in the military schools, 2,614 in the sanitary corps, 1,952 in the commissariat, 161 in the invalid and veteran corps, 2,321 in the penal establishments, and 381 in the remount depots; total 13,918 officers and 254,087 men. There were 11,504 officers on unlimited leave in the permanent army, and the mobile militia and the territorial army had besides 4,233 effective and 6,254 reserve officers. The troops on unlimited leave in the permanent army numbered 571,254, and those of the mobile militia 304,587, and the territorial army had 2,106,233 men, making the total war strength of the army 3,272,070 men of all ranks. This does not include the special African corps, which in 1900 numbered 6,780 regular troops, including 5,457 natives and 768 irregulars.

The Navy.—The Italian navy in the spring of 1901 had 3 effective battle-ships of the first- or second-class, 8 armored cruisers, 4 third-class battle-ships, 5 old ones that were still effective, 12 protected cruisers, 15 torpedo gunboats, 5 destroyers, 11 first-class, 100 second-class, and 71 third-class torpedo-boats, and 1 submarine boat. The *Ammiraglio di Saint-Bon* and *Emmanuele Filiberto*, of 9,800 tons, the latest completed battle-ships, have a 10-inch steel belt and 3-inch protective deck, engines of 13,500 horse-power, giving a speed of 18 knots, and an armament consisting of 4 10-inch guns mounted in turrets and 8 6-inch and 8 4.7-inch quick-firing guns. The turret ships *Regina Margherita* and *Benedetto Brin*, of 13,500 tons, not fully ready for sea, have 8-inch Terni armor, engines of 18,000 horse-power, designed to make 21 knots, and an armament of 4 12-inch, 4

8-inch quick-firing, 12 6-inch quick-firing, and 8 3-inch quick-firing guns. The *Regina Elena* and *Vittorio Emmanuele*, not yet launched, will have a displacement of 12,625 tons, engines of 20,000 horse-power, intended for a speed of 22 knots, and an armament of 2 12-inch guns in turrets, and 12 8-inch and 12 3-inch quick-firers. Their protection is a 10-inch Terni belt, 10 inches on the turrets, 8 inches on the bulkheads, and 6 inches on the secondary battery, impervious to shells at every point. A new naval program has been adopted, to cost 419,000,000 lire spread over twelve years. From 1901 to 1904 the vessels already begun will be completed, and 5 10,000-ton armor-clads built at a total cost of 203,000,000 lire, the projected vessels to cost 24,000,000 lire each; between 1904 and 1909 5 more armor-clads of about the same size and strength are to be built, with 1 smaller one, 2 auxiliary vessels, and 11 torpedo-boats to take the place of obsolete ones, the whole to cost 139,000,000 lire; and between 1909 and 1912 various obsolete vessels will be replaced at a cost of 77,000,000 lire.

Commerce and Production.—The production of wheat in 1899 was 48,600,000 hectoliters; of corn, 31,200,000 hectoliters; of wine, 31,800,000 hectoliters; of olive-oil, 920,000 hectoliters; the number of citrus fruits gathered, 4,050,000,000. There were 4,936 hectares planted to tobacco in 1898. Silk culture employed 550,048 persons in 1895, and 172,000 persons were employed in spinning and weaving silk. The average annual production of cocoons is 50,000,000 kilograms; of silk, 4,465,000 kilograms. There were 40,143 cattle exported and 16,855 imported, 35,584 sheep exported and 5,217 imported, 1,019 goats exported and 2,942 imported, and 73,391 hogs exported and 1,582 imported in 1899. The forests cover 4,093,000 hectares, and their products are estimated to be worth 88,000,000 lire a year. The value of agricultural and horticultural products is 2,647,000,000 lire; of animal products, 1,424,000,000 lire. The production of iron ores in 1898 was 190,110 metric tons; of manganese ore, 3,002 tons; of ferro-manganese, 11,150 tons; of copper ore, 95,128 tons; of zinc ore, 132,099 tons; of lead ore, 33,930 tons; of silver ore, 435 tons; of gold ore, 9,549 tons; of antimony ore, 1,931 tons; of quicksilver ore, 19,201 tons; of iron and copper pyrites, 67,191 tons; of mineral fuel, 341,327 tons; of sulfur ore, 3,362,841 tons, valued at 40,375,152 lire; total value of mineral products, 71,804,000 lire; value of marble quarried, 15,000,000 lire. The number of fishing vessels and boats at the end of 1898 was 23,578, of 68,654 tons, of which 184, of 1,215 tons, were engaged in the coral fisheries. There were 83,834 fishermen, of whom 6,554 were engaged in deep-sea and foreign fishing.

The total value of special imports of merchandise in 1899 was 1,506,561,188 lire, and of special exports 1,437,416,398 lire. The imports of precious metals were 5,529,700 lire, and exports 15,845,900 lire. The imports of coal were 150,646,236 lire in value; of raw cotton, 107,951,992 lire; of silk, raw and twisted, 102,406,700 lire; of wheat, 90,755,020 lire; of machinery, 61,162,974 lire; of wool, 51,785,750 lire; of timber, 43,585,786 lire; of hides, 41,096,385 lire; of fish, 30,364,633 lire; of horses, 29,541,600 lire; of leaf tobacco, 19,138,193 lire; of raw sugar, 17,058,272 lire; of bar iron and steel, 15,733,694 lire; of olive-oil, 15,202,708 lire; of refined mineral oil, 14,992,047 lire; of coffee, 12,774,160 lire; of linen and hemp yarn, 10,756,030 lire; of cheese, 5,356,935 lire; of cotton yarn, 4,717,365 lire; of indigo, 3,985,000 lire; of railroad materials, 2,133,755 lire; of silkworm eggs, 1,957,500 lire; of printed cottons, 1,903,730 lire; of cot-

tons, colored and dyed, 1,394,605 lire; of bleached cottons, 1,030,120 lire; of unbleached cotton, 443,640 lire; of refined sugar, 203,796 lire. The exports of raw and thrown silk were 419,120,000 lire in value; of wine in casks, 66,993,141 lire; of olive-oil, 55,738,380 lire; of eggs, 43,937,010 lire; of sulfur, refined and unrefined, 43,461,876 lire; of hemp and flax, 36,906,589 lire; of silk waste, 34,125,650 lire; of manufactured coral, 30,674,880 lire; of skins, 22,188,928 lire; of marble, 18,482,948 lire; of fresh and salted meat, 18,451,375 lire; of zinc ore, 16,812,840 lire; of rice, 13,521,495 lire; of cattle, 12,205,170 lire; of straw plaiting, 9,264,000 lire; of dyes and tan, 9,231,604 lire; of hogs, 5,380,850 lire; of grain, 4,561,105 lire; of cocoons, 3,336,820 lire; of cotton, 1,644,228 lire; of horses, 990,500 lire; of lead ore, 594,510 lire. The value of reexports in 1899 was 32,922,000 lire; of the transit trade, 132,287,000 lire.

The special trade in merchandise with the principal foreign countries in 1899 is given in lire in the following table:

COUNTRIES.	Imports.	Exports.
Great Britain.....	299,537,000	147,958,000
Germany.....	193,964,000	236,107,000
France.....	152,330,000	201,293,000
Austria-Hungary.....	160,848,000	158,698,000
Switzerland.....	49,337,000	246,618,000
United States.....	169,414,000	118,304,000
India, etc.....	73,999,000	28,420,000
Argentine Republic.....	27,168,000	60,574,000
Turkey and Balkans.....	43,416,000	35,051,000
Belgium.....	36,884,000	24,424,000
Spain.....	21,249,000	14,334,000
Egypt.....	7,791,000	27,719,000
Brazil.....	13,081,000	16,565,000
Central America.....	1,628,000	5,014,000

Navigation.—The number of vessels that were entered at Italian ports during 1899 was 105,824, of 30,307,513 tons, of which 94,804, of 19,178,698 tons, were Italian and 11,020, of 11,128,815 tons, foreign; the number cleared was 105,712, of 30,162,879 tons, of which 94,778, of 19,130,920 tons, were Italian and 10,934, of 11,031,959 tons, foreign.

The merchant navy on Jan. 1, 1899, comprised 5,764 sailing vessels, of 537,642 tons, and 384 steamers, of 277,520 tons.

Railroads, Posts, and Telegraphs.—The length of the principal Italian railroads is 9,747 miles. The receipts in 1897 amounted to 279,810,833 lire, and expenses to 198,317,567 lire. The number of passengers conveyed was 54,415,294; tons of freight, 19,148,875 by slow and 1,280,834 by express trains.

The post-office in the year ending June 30, 1898, forwarded 252,292,942 letters and postal cards, 8,554,664 manuscripts, 277,002,844 newspapers, etc., and 11,929,470 money orders, amounting to 846,915,330 lire. The length of telegraph-lines on June 30, 1898, was 26,085 miles, with 101,198 miles of wire. The Government owned 23,937 miles of line, with 77,718 miles of wire, and railroad companies 2,147 miles of line, with 23,477 miles of wire. The number of internal paid telegrams in 1898 was 7,555,564; of foreign telegrams, 1,111,896. The postal receipts in 1898 were 56,709,050 lire; telegraph receipts, 13,948,014 lire; postal and telegraph expenses, 57,858,241 lire; net revenue, 12,798,823 lire.

Politics and Legislation.—The perennial difficulties of Italian finance led to the resignation of Signor Rubini from the Cabinet during the holiday recess of the Chamber. Signor Chimirri took temporary charge until Gaspare Finali was appointed Minister of the Treasury on Jan. 7, 1901. The financial problem was to reconcile the demands of the ministries with the promised alleviation of the crushing burden borne by the

poorer taxpayers. The Saracco Cabinet, constituted as a Ministry of Affairs, had a precarious tenure of office. When the Chambers met on Jan. 27 the Cabinet was assailed from both sides of the Senate for its action in dissolving the Socialistic Chamber of Labor in Genoa and afterward sanctioning its reconstitution when the workmen of that city struck in sign of protest.

Other statesmen were ambitious to cope with the questions of financial and administrative reform and the renewal of the Triple Alliance expiring in 1902. The question of the Genoa strike was the pretext, not the cause, of the fall of the Cabinet, which could not save itself by bringing in a new anti-Anarchist bill. Rudini, Giolitti, Crispi, and Pelloux, who had been Prime Ministers at different times since 1891, when in face of a combination that compassed the downfall of their Cabinets, resigned in every instance without waiting for a hostile vote. Signor Saracco waited for a vote of censure, and was beaten on Feb. 6 by the enormous majority of 318 to 102. The King, after consulting the leaders of all the parties, decided to entrust the task of forming a new Cabinet to Signor Zanardelli, a leader of the Liberals. The chiefs of the Extreme Left refused to enter the Cabinet unless a drastic reduction in military expenditure was promised, and on Feb. 14 a ministry containing 3 Zanardellians, 3 Giolittians, 3 Conservatives, with the same professional heads of the army and navy departments as in the retiring ministry, was formed as follows: President of the Council, Giuseppe Zanardelli; Minister of the Interior, Giovanni Giolitti; Minister of Foreign Affairs, Giulio Prinetti; Minister of War, Count Ponza di San Martino; Minister of Marine, Admiral Morin; Minister of Finance, Leone Wollemborg; Minister of the Treasury, Ernesto di Broglio; Minister of Justice, Francesco Cocco-Ortu; Minister of Public Works, Girolamo Giusso; Minister of Agriculture, Silvestro Picardi; Minister of Public Instruction, Nunzio Nasi; Minister of Posts and Telegraphs, Tancredi Galimberti. The tax reforms promised by the Zanardelli-Giolitti Cabinet were the abolition of the octroi on flour and bread and the removal of octroi barriers in towns of less than 20,000 inhabitants, 274 in number, two-thirds of them situated in the south, where the octrois press the hardest. The opening of these closed communes by doing away with gates and collectors does not abolish all octrois, but the toll collected on necessities of life is much lighter, the remission of taxation amounting to 40,000,000 lire, which the Government expected to regain by a steeper rate of progression in the succession duties. The new ministry had to confront an Opposition majority at the outset of 187 to 160 Ministerialists including 80 Extreme Radicals and Socialists. Hostile committees were chosen, and the commission which examined the fiscal program of the Government rejected all its provisions. The municipalities it was intended to relieve condemned this scheme for the partial abolition of the gate duty on breadstuffs. The Cabinet had then no definite program. Yet it remained in office, passing its bills with the help of the Opposition and in spite of its supporters. The army budget was fixed at 275,000,000 lire a year for a sexennial period, including 35,000,000 lire for pensions and a provision for gradually renewing the 7.5-centimeter guns of the field-artillery. The annual naval estimates were in like manner limited to 121,000,000 lire for six years.

The new Minister of Foreign Affairs had made himself chiefly conspicuous in that department of politics in former days by attacking the Triple

Alliance. He took an early opportunity to explain that he was not bound by any previous irresponsible declarations, but the Cabinet did not pledge itself prematurely to renew the alliance with Germany and Austria. Commercial treaties with those countries were being negotiated, and favorable trading conditions with them were of great importance to Italian prosperity. Although the commercial treaty concluded in 1898 ending the tariff war with France relieved an intolerable situation, no new arrangements that could be made with the Protectionist Government of France would outweigh the economic advantages of reciprocity with Austria and Germany. The Duke of Genoa in command of an Italian squadron visited Toulon to salute the President of the French Republic in sign of the continued good relations between Italy and France. The discussion of the Triple Alliance in the European press drew from the Minister of War and the Prime Minister the statement that this secret compact does not bind Italy to maintain any specified number of army corps or strength of armaments. The external ambition of Italy has in recent times been directed neither toward the Trentino nor Nizza, nor seriously attracted to colonial expansion in East Africa, China, or other remote regions, but Italians of every party look forward to the possession of Tripoli, not alone for its economical possibilities, chiefly rather for its military value for the security of Italy, since if it fell into other hands Italy would be surrounded by a continuous circle of foreign coast line. For a like reason Italians are jealous of the designs of any power upon the opposite coast of the Adriatic, and are not more willing that Austria should extend her influence in that direction when she is the present ally of Italy than they would be if the two Governments were estranged. Italians still hope to possess the whole coast of the Adriatic, and Albania is the heritage for which they look with assurance when the Turks depart from Europe. Many Italians reside in Albania, and with the progressive weakening of the Sultan's rule they look more and more to the Italian Government for protection. An independent Albanian state would not be regarded with apprehension in Italy, as it might in Austria, because it would be open to progressive Italian influence. There are 200,000 Albanians in Italy who have their own college, and in some districts Albanian blood is mingled with Italian. Congresses for Albanian national independence are held in Italian cities. The country across the seas which stirs the interest and pride of Italians is the Argentine Republic, a region remote from the political and colonial ambitions of Italy, where still the vitality and colonizing capacity of the Italian race is best exemplified, where 700,000 Italians by their intelligence and industry have created a valuable market for Italian produce.

The advent of a Cabinet of the Left depending on Socialist support was the signal for forming among workmen and agricultural laborers leagues of resistance and improvement leagues which covered whole provinces, with the object of obtaining by collective action an increase of wages. Landowners and employers, after the sanguinary suppression of the riots of May 1, 1898, had diminished wages and withdrawn concessions. Now that Signor Giolitti and other Liberals were in office the working classes attempted to regain by organization what they lost. Strikes accordingly broke out all over the country. Signor Turati and the evolutionary Socialists who followed him declared freedom of Socialist propaganda and organization to be the price the Gov-

ernment must pay for the parliamentary support of the Socialist group, and aimed, through the network of labor organizations with which they covered the country, to sweep the working-class constituencies at the next general election, taking the seats held by their Radical and Republican allies and coming back to the Chamber in such strength that they can demand admission to the committees and to the ministry and shape legislation affecting the working people. The revolutionary branch of the party had no sympathy with these parliamentary aims and methods. Minister Giolitti made no attempt to repress the leagues of resistance. He directed the prefects to act as arbitrators in labor disputes wherever they could. In some instances the carabinieri persuaded laborers who took the place of strikers to cease work for fear of provoking a conflict. Whenever disorderly strikers were arrested they were quickly released. The internal policy of the Government was accepted, and the life of the Cabinet was assured after a declaration of loyalty to the Monarchy from Signor Zanardelli by the voting of the estimates of the Ministry of the Interior on June 22 by 264 votes to 184; but in the Senate the ministerial majority was only 3, owing to animosity against Signor Giolitti. The Prime Minister said that the motive of the Liberal administration was to safeguard the free exercise of public rights though giving a free scope to agitations, since liberty is won by struggles and is to be preferred with all its perils; but if recourse were had to violence he promised to repress it with inflexible severity. Immediately after the Chamber gave its approval to the liberal policy of the Government, in a tumult at Berra, near Ferrara, 30 peasants fell victims to the revolutionary fermentation, or to a reckless blunder of the lieutenant who commanded the troops to fire, who was maligned by the whole Liberal press and by the Socialists in the Chamber, but was acquitted by a court-martial. There were no other riotous disturbances, though at Mantua the striking harvesters burned barns. The strikes increased up to and after the adjournment of the Chamber on June 30, and the agricultural laborers, bricklayers, cigarmakers, operatives in macaroni factories, railroad brakemen, and other workers generally succeeded in obtaining a considerable rise in wages. A strike of seamen at Genoa was not settled, despite Signor Zanardelli's effort to induce arbitration, because the ship owners would not listen to a delegation of the united labor league. The excitement caused by the Berra incident led to monster meetings of Anarchists, Socialists, and Republicans in Rome, Milan, and Naples, in which the King, the upper classes, and the army were violently denounced. This agitation served to develop the cleavage, already pronounced, between the opportunists and the extremists or idealists of all three groups of the Extreme Left—between the Radicals who adhered to the Monarchy and those who would not; between the Republicans who would evolve the Republican ideal out of the existing monarchial Government and those who aimed to establish the republic upon its ruins; between the Possibilist or Ministerial Socialists and the Revolutionary or Anarchoid Socialists, who would join the Anarchists in precipitating a convulsion. The Anarchoids were most numerous in the rank and file of the Socialist party, and compelled Signor Turati and his partisans to withdraw from the Milanese Socialist federation in order to found a new federation of Possibilists. Clerical peasants' leagues committed outrages in Lombardy, which were checked by the prompt action of the police and troops. Signor Wollem-

borg was not more successful than his predecessors in solving the problem of tax reduction. His scheme involved the sacrifice of 325,000,000 lire of revenue without adequate compensation. It was rejected by the Cabinet, and he resigned on July 31. The Minister of Agriculture and Commerce gave up also his portfolio, which was accepted by Prof. Guido Bacelli on Aug. 4, and the Ministry of Finance on Aug. 8 by Signor Carcone, who held the same post in the first Pelloux Cabinet. The finances of the Government showed a surplus of about 17,000,000 lire for the year ending June 30, 1901, instead of the expected deficit. The development of the sugar industry led to a large increase of the sugar tax.

Dependencies.—The ultramarine possessions of Italy consist of the colony of Eritrea on the Red Sea coast and Obbia and a part of the Somali coast to the south of it ceded to Italy by the Sultan of Zanzibar in 1892, extending 180 miles inland and including the ports of Brava, Merka, Mogadocio, and Warsheik (see EAST AFRICA). Eritrea has an area of 88,500 square miles and a population of about 450,000. There were 2,014 Europeans in 1899. The port of Massowah had

7,775 inhabitants. The imports in 1899 were valued at 9,071,391 lire. There were 2,953 vessels, of 113,179 tons, entered and 2,947, of 113,095 tons, cleared, four-fifths of the vessels being Italian. A railroad, of which 17 miles have been built, is being carried by an Anglo-Italian company from Massowah to Asmara, the seat of government, and a telegraph to Adis Abeba, the capital of the Negus Menelek (see ABYSSINIA). The railroad, which will allow gold-mines in the interior to be exploited, is to be finished in 1903. The colony has an autonomous administration and the management of its own finances. Gov. Martini in March, 1901, negotiated with Anglo-Egyptian representatives the frontier delimitation between Eritrea and Kassala, which Italy restored to Egypt in 1897 after three years of Italian occupation. Tomat, at the junction of the Setif with the Atbara, remains under Italian influence. The frontier between French and Italian territory in the south was delimited by a joint commission about the same time, and Italy obtained the important post of Assab. Signor Dulio is Governor of the Benadir Coast, which is otherwise called Italian Somaliland.

J

JAPAN, a constitutional empire in the Pacific Ocean, occupying a chain of islands between the Russian and the American possessions, from north latitude 21° 48' above the Bashee Channel near the Philippines, to 56° 56' near the Kurile Islands; and from east longitude 156° 32' to 119° 20'. Of the 4,000 and more known islands, more than 500 are inhabited, though nearly three-fourths of the people live on the main island, Hondo. The population Dec. 31, 1898, was 43,760,754, or, with that of Formosa (2,797,543), the total is 46,558,297. The money standard is gold, a yen being worth 50 cents.

The feudal system, after nearly one thousand years of development, was abolished in 1871. The Emperor, whose personal name is not in general use either officially or popularly, and who has no family name, bears the usual title of Tenno, "Son of Heaven," or Kotei, "Emperor," but the most ancient title, which has obtained an honorable place in the languages of civilization, is that of Mikado, or "Honorable Gate." Only male descendants succeed to the throne, and the Mikado not only reigns but governs. Mutsuhito, the present ruler, born in Kioto Nov. 3, 1852, is the one hundred and twenty-second of the imperial line, succeeding his father, Komei, Feb. 13, 1867. He married, Feb. 9, 1869, the Princess Haruko, born May 28, 1850, daughter of Prince Ichijo. She is childless. The heir apparent, Prince Yoshihito, was born Aug. 31, 1879, of the Lady Yanagawara Aiko, of the imperial harem. He married, May 10, 1900, his cousin the Princess Sada, daughter of Prince Kujo, born June 25, 1884. A male child, Hirohito (Michi-no-Miya), was born of their union May 5, 1901. The civil list is 3,000,000 yen, or 1.5 per cent. of the state revenues. By the Constitution of 1889 the Emperor limited his prerogative, and he shares legislative power with the two houses of the imperial Diet, the upper house having about 316 peers and imperial nominees, and the lower house 369 members, from 16 urban and 308 rural districts, elected by subjects who pay at least 10 yen in direct taxes. The general tendency of political life is toward democracy, and constitutional reform has been steadily continuous, with a tendency, despite frequent fail-

ures, toward the English, rather than the German system. The sixteenth annual meeting of the Diet began Dec. 10, 1901. After twenty-two months of office, the Yamagata Cabinet resigned in March, 1901, and a new Cabinet was formed by the Marquis Hirobumi Ito in May, which lasted but a few weeks. The Emperor then summoned Viscount General Katsura to form an administration, which is still in office.

The imperial Cabinet, over which the Emperor actively presides, consists of the Minister President of State and nine heads of departments. The Emperor is also assisted by a Privy Council of 20 statesmen of age and experience, who have great influence in the appointment of the Mikado's servants, from Prime Minister to consul. There is also a Court of Accounts, an administrative tribunal, and two administrative bureaus, for the upper and lower house respectively. Besides this Central Government there is the other division of the provincial government, in which are grouped the prefecture of the police of Tokio, Department of the Colonization of Yezo, the Fu and Ken (prefectures of the districts, 47 in all, with 14,687 subdivisions), and government of the island of Formosa. In 1898 the total number of civilian employees of the Government was 68,876, who drew salaries to the amount of 18,587,710 yen.

The Army.—The Emperor is commander-in-chief of the army and navy, and the whole male population between the ages of seventeen and forty is liable to military service. Both the naval and the military forces are divided into the actual service, the reserve, and the territorial forces. The standing army is divided into the active army, levied from males of the age of twenty, who must serve with the colors three years, but in the case of the navy four years. Of all branches of the service, including the police, the total in 1899 was 6,557 officers and 149,134 men for a peace footing. In the reserves are 1,734 officers and 178,153 men; and in the territorial army 834 officers, 96,317 men, with a still further reserve force of 168,249 men, who in an emergency may be drawn upon, making a grand total of 583,119. There are training-schools for almost every branch of the service. All the small arms, cannon, and ammunition are

made in the Government arsenals at Tokio and Osaka. The rifle used by the infantry was invented by Col. Murata, and is exactly fitted for the man who uses it. In its improved form, since the war of 1894, it is a repeater. The Arisaka quick-firing cannon, very light and effective, was introduced in 1901. Much attention is paid to the education of the soldiers. The number of illiterates is steadily decreasing, there being in the army more than 65,000 graduates of the elementary schools and about 1,000 of the middle or higher schools. The number of horses in service is 30,000. The Red Cross Society in 1900 had 728,507 members, with a total income of 4,657,575 yen, and two fully equipped hospital ships.

The Navy.—The Japanese began the formation of a steam navy almost immediately after first (in 1853) seeing a steamship, which was the first large United States war steamer, the *Mississippi*, of Commodore Perry's squadron. The Yedo Government at once sent students to learn from the Dutch at Nagasaki, and by 1860 one of these young men was able to navigate a steamship across the Pacific. Naval development has gone on steadily since. There are five maritime districts, in three of which are docks, arsenals, barracks, foundries, and other facilities for ship-building. Maizuru, on the west coast, fronting Vladivostok, chosen in 1890, is now being laid out. Muroran, as yet only a village of 1,150 souls, is in Yezo. In 1898 the mean daily force in the naval service, exclusive of commissioned officers, was 18,426. The number of deaths by disease was 129, or 6.34 per 1,000 patients, a decrease of 9.91 per thousand, compared with the death-rate for the preceding fourteen years. The improved system of diet has driven *kaké* out of the navy, and the increase of body weight per man, from 1884 to 1898, is from 121 to 130 pounds. In 1901 the actual fleet afloat and in commission was more than 70 vessels, with a *personnel* of more than 25,000, of whom more than 6,000 were trained officers. In December, 1901, there were 8 battle-ships, 10 coast-defense ships, 18 cruisers, 16 gunboats, 3 despatch-boats, 1 torpedo-depot, and more than 50 torpedo-boats, besides 1 battle-ship, 3 cruisers, 3 second-class cruisers, and 30 torpedo-boats building at home and abroad.

Finances.—The dearth of available capital in Japan for the carrying out of the multifarious private enterprises natural to a nation that in recent years has passed from the agricultural to the industrial and commercial condition, together with the great expansion of national energies under the direction of the Government since the Chino-Japanese War of 1894, has caused much financial embarrassment, the trouble arising from increasing wealth rather than otherwise. Since Oct. 1, 1897, Japan has employed the gold standard. From the establishment of the mint at Osaka in 1870, money to the amount of 516,744,691 yen, in bronze, copper, nickle, silver, and gold pieces (3 of gold, 6 of silver, 1 of nickle, and 1 of bronze), has been coined, but in December, 1900, the mint struck 171,719,820 yen in 10-yen pieces and 315,000 in 50- and 10-sen pieces. The indemnity collected from China—365,194,997 yen—furnished ready money, of which 20,000,000 yen were gratefully given to the Emperor, and the rest employed in the enlargement of the navy and in coast defense. The outbreak in China in 1900 required the expenditure of 23,905,611 yen out of this indemnity fund, most of which it was proposed to make good by extra taxation, but against this measure the House of Peers protested. The national debt in September, 1901, was 526,664,194 yen. The budget for 1901 as passed

by the Diet was: Ordinary revenue 201,247,095 yen, and extraordinary revenue 53,358,486 yen. The revenue is from (1) taxation, 149,351,250 yen; (2) Government enterprises, 46,524,610 yen; (3) miscellaneous receipts, 5,371,235 yen. The principal items of taxation, stated in million yen, yielded as follows: The land tax 46, sake tax 55, stamp duties 13, and custom duties 15. The receipts, 24,665,964 yen, from post, telegraphs, and telephones, form the principal item of revenue from Government enterprises, after which is that from the patent bureau, 9,610,011; and the third from the railways, 8,665,964 yen. The ordinary expenditures amounted to 163,568,171 yen, and extraordinary to 85,775,851 yen, or a total of 249,344,622, showing a surplus of 5,620,959 yen. Nevertheless, in the extraordinary revenue is an item of 29,862,450 yen derived from domestic loans that as yet have not been floated. And another item in extraordinary revenue is 19,315,105 yen appropriated from the Chinese indemnity. In the expenditures the departments receive as follow: Foreign, 2,270,367 yen; Home, 9,165,533 yen; Finance, 52,995,173 yen; War, 38,001,488 yen; Navy, 20,161,010 yen; Justice, 10,821,375 yen; Education, 4,725,578 yen; Agriculture and Commerce, 2,533,007 yen; Communications, 19,984,640 yen. The budget submitted for 1902 sets forth a revenue of 261,493,272 yen, of which 226,345,000 yen is ordinary, and 35,148,272 yen is extraordinary expenditure, its largest item being the issue of bonds to the amount of 22,525,150 yen. The total ordinary revenue from Formosa for 1900 was 10,270,186 yen, against 7,493,650 yen in 1898, making, with the extraordinary revenue in 1900, 17,426,665 yen, against 11,283,265 yen in 1898. In the domestic trade in 1900 the exports amounted to 4,678,000 yen, and the imports to 8,439,000 yen. In foreign trade the exports were worth 10,571,000 yen, and the imports 13,570,000 yen.

Resources.—The year 1900 was characterized by a great expansion in commerce, industry, and new enterprises, calling for ready money, which the country itself, though so prosperous, can not provide. The official investigations of the Home Department show that the national wealth of Japan for 1898 was 113,060,000 yen, against that in 1888 of France, Germany, Austria, Italy, Russia, and the United States of 85,000,000, 64,000,000, 38,000,000, 29,000,000, 50,000,000, and 128,000,000 yen respectively; or, 150 yen per head of population in 1901, against 2,240, 1,440, 990, 1,000, 550, and 2,100, respectively, of the other countries. In national expenditure in 1901 Japan's burden was 248 out of every 1,000 yen, or 4 yen per head, or 22 out of every 1,000 yen of wealth. In national loans in 1900, Japan had 486,460 yen, or 10 yen per head, and 42 yen in every 1,000 yen of wealth, the exports reaching a total of 204,000,000 yen and imports 287,000,000 yen; in savings there were but 51,908 yen, or less than 1 yen to each head, or 5 to every thousand yen of wealth. The ratios of other customs were published in full, for educational purposes. In the customs' returns to the amount of 1,500,000 yen in 1899 many articles that in 1870 had no figure in the list were exported, such as buttons, which were practically unknown to Japanese dress in 1868, 230,000 yen; leather boots and shoes, formerly unknown, 30,000 yen, and averaging 1.52 yen per pair; gloves, 10,000 yen; hats, caps, and bonnets, 180,000 yen; cotton shirts, 112,000 yen; socks and stockings, 112,000 yen. The researches show that the country's wealth in 1887, as compared with 1877, had increased 40 per cent; and in 1897, as compared with 1887, 60 per cent. Investigations made during several months of 1901

show that in September there were, when free from debt, 441 Japanese subjects worth 500,000 yen, or 1 semimillionaire in yen for every 100,000 people, of whom one-third were in Tokio, 38 being in the one district of Nihon Bashi. One or two men have amassed wealth in one generation; the others have inherited the greater part of it. In March, 1901, there were 61 cotton-spinning companies with 61 factories and 968,301 spindles, with an output of 17,847,644 pounds of cotton yarn, employing 42,870 operatives, of whom 40,152 were females. Disturbances in China have greatly affected the business of textiles, the decrease in the last half of 1900 being 45,523,000 pounds below that of the first half. At the end of 1900 the area of mulberry farms was 751,368 acres, yielding 13,763,570 bushels of cocoons; 3,718,970 cards of eggs were reared to silkworms, 2,752,714 koku of cocoons raised, and 44,657,028 yen worth of raw silk and 4,161,318 yen of waste silk were exported. The total ordinary revenue from Formosa for 1900 was 10,270,186 yen, against 7,493,650 yen in 1898, making, with the extraordinary revenue in 1900, 17,426,665 yen, against 11,283,265 yen in 1898. In the domestic trade of Formosa, in 1900, the exports amounted to 4,678,000 yen, and the imports to 8,439,000 yen. In foreign trade the exports were worth 10,571,000 yen, and imports 13,570,000 yen.

Communications.—The Nippon Yusen Kaisha (Japanese Ocean Navigation Company) declared a dividend of 12 per cent. in May, 1891, having a fleet of steamers (6 of them on the Hong-Kong-Seattle line, of 6,000 tons each) worth, by a rigid modern standard of reckoning, 18,750,426 yen. In railway development, exclusive of Formosa, there were on March 31, 1900, 3,689 miles open, of which 2,806 were of private and 883 of Government ownership, the total cost of construction being 243,423,280 yen, or 67,024 yen per mile. The receipts for one year amounted to 39,110,519 yen, and expenses to 18,833,217 yen, the profit per cent. on cost being 0.80, and per day on a mile 14.99. The number of passengers carried was 102,115,942. The checking system for baggage is used. The once beautiful landscape has been made an eyesore by the disfiguration of advertisements. In the year ending March 31, 1900, 50,000 persons were employed in the postal department, 624,706,890 articles of small matter were handled, and 5,852,045 parcels conveyed, through 4,447 offices, with 44,002 letter-boxes, and more than 185,110,402 miles of postal routes. These figures do not include Formosa, whose statistics are remarkable for their increase from 1896. Including Formosa, there were 1,496 telegraph offices and 105,361 miles of wire, over which 14,567,000 domestic and 277,300 international messages were sent, the total receipts being \$3,130,790, and the expenses \$2,532,205. For the delivery of telegrams, bicycles are used. Of telephones there were 72 offices and 11,813 subscribers, who held 40,000,000 conversations over 178,065 miles of separate wires. The expenses of inauguration and working amounted to \$1,150,000, and the receipts for 1900 were \$560,000. In 1898 the Japanese had only one steamer of 5,000 tons or more, but now they have 21 vessels of that size. On Sept. 16, 1901, there were in the empire 942 steamers of 557,166 tonnage, 3,416 sailing vessels of 315,767 tonnage, the crews of which numbered 15,327. Ship-building has received a great stimulus through bounties offered by the Government. The metric system is used side by side with the native measures, which are decimal. A *tsubo*, which is exactly the size of two floor mats, so that it conveys clearly an exact measure picture to the native eye, has no deci-

mal features. Hence the Japanese engineers, mechanics, artisans, and merchants calculate by this square measure especially. In 1900, 21,000 foreign tourists traveled in the empire.

Public Hygiene.—The national health is decidedly improving. The report of the Central Sanitary Bureau for 1896 shows that the most common diseases are dysentery, typhoid fever, small-pox, cholera, and diphtheria, the number of cases of these disorders in 10,000 of the population being in round numbers 16, 9, 3, 2, 1, respectively. Of 85,876 persons attacked with dysentery, 26 out of every 100 died. Of every 100 attacked with diphtheria in 1895, 49 died, but after the introduction of treatment by serum, the rate in the empire fell to 38, and in Tokio to 23. There are 39,214 practising physicians, or 1 to every 1,036 persons, in the empire. In the hospitals the most advanced results of modern science and experience, many of them first introduced or suggested by Christian missionaries, are in use. In health, strength, weight of body and length of average life, improvement has been made in the whole empire, and most notably in the army and navy.

Trade.—Since 1890 the purchases of Japan from countries other than the United States have been trebled, while American exports to Japan have increased tenfold. In 1900 the trade with the United States was greater in volume and value than that with any other country, amounting to one-fourth of the total business. The exports were valued at 204,429,994 yen, and the imports at 287,261,845 yen. In 1900 the trade with China amounted to 61,800,000 yen, Great Britain 82,900,000 yen, Germany 32,700,000 yen, the United States 115,300,000 yen. The exports to the United States were 52,566,395 yen, and the imports were 62,761,196 yen. In 1901 the exports of the first six months amounted to 115,340,136 yen, and the imports to 130,599,018 yen. The United States buy, in millions of yen, tea, 7; rice, camphor, raw and manufactured silk, 32; matting, 3; porcelain, 1; plaited straw, 1; and fans, 1. The Americans sell all kinds of machinery, 4; flour and foodstuffs, 4.5; steel rails and manufactured iron or steel, 3.5; petroleum and other oils, 11; cotton, 8.4; and other articles that minister to the most advanced needs of civilization. The cotton-crop of Japan is unimportant, and raw cotton must be imported.

Religion and Education.—Shinto with 12 sects, Buddhism with 38 large and many smaller sects, and Christianity in its 3 forms (Greek, Roman, and Reformed) are the acknowledged religions of the country, protected by law, their followers being guaranteed absolute freedom of belief and practise, within the limits not prejudicial to peace and order, and not antagonistic to their duties as subjects. In 1897 there were of temples, Shinto, 191,962; of Buddhist, 109,945; of Christian church edifices, 289. In 1900 there were of Protestant missionaries 723, with 42,273 members, 416 congregations, with various schools, and most of the appliances of modern philanthropic work. The Roman Catholics, with 106 missionaries, had 251 congregations, and 54,602 adherents. The Russo-Greek Church, with 297 churches, had 25,698 followers. There were 5,111 day- or boarding-schools and 33,039 Sunday-school pupils in Protestant missionary schools, with property valued at 751,140 yen, apart from church edifices valued at 376,109 yen; and 14 theological schools with 98 pupils and 234 graduates of same. In 14 hospitals or dispensaries, 2,268 in-patients and 26,729 out-patients were treated. The amount raised by native Protestant Christians for all purposes in 1900 was 107,459 yen.

The national system of education, elaborated in

the early seventies under American supervision, has been extended throughout the empire. Elementary education is compulsory—excluding Formosa, in which the system is especially adapted to the three various races on the island. In 1900, while the number of children of school age (six to fourteen) was nearly 8,000,000, only 4,168,717 were in actual attendance, in 28,453 schools taught by 87,855 teachers. Of these, 3,930,843 were in the common public and 63,149 in ordinary private schools. In the public middle schools there were 43,223, and in private schools 9,219 scholars. In the higher middle schools were 4,436, in the imperial universities 2,255, and in the normal schools 8,830 pupils. There are also special schools of almost every description, including those for art, manual industry, industrial trade, the blind and mute, etc., exclusive of those in the military and naval departments. In 1900 about 100 students were supported by the Government in their studies abroad. In the imperial universities in Tokio or Kioto are 18 students from other Asiatic countries; 200 Chinese in the schools, mostly military; 70 Koreans, a majority of whom study law; and 2 Filipinos.

Politics and Events.—On Feb. 3, Mr. Y. Fukuzawa, editor, author, and founder of a university, described by the natives as "the greatest motive force of Japanese civilization," the sale of whose books, championing Western civilization reached a total of 4,000,000 copies, died, and 10,000 persons on foot accompanied his remains to the temple in Tokio, set apart in 1859 as the home of the first American legation in Tokio.

The Diet reduced the budget by 3,496,891 yen. The House of Peers refused to pass the new taxation bill or to increase the salaries of the judges, and the Emperor was obliged to intervene, acting on his own account, without the signature of the ministers to his decree. The Diet was closed March 29. During the session, of 1,229 petitions received, 871 failed to receive attention. Of 53 Government bills, 52 passed. Of the 150 important measures presented, 92 were passed. After the resignation of the ministers, the Emperor summoned Marquis Ito to form a Cabinet. This he did, gathering around him young men of signal ability, most of them educated in the West; but the burden of unsolved financial problems, owing to the carrying out of the enlarged post-bellum program at a time when so many other enterprises were on foot in the country, made it impossible to provide the ready money, and this, with other reasons, caused the resignation of the new Ito Cabinet on May 2. The Emperor summoned Viscount General Katsura to organize a new ministry, which was installed June 2.

On June 21, in Tokio City Hall, Mr. Hoshi Toru, late Japanese minister at Washington, was assassinated. The assassin was a highly educated Conservative and teacher of swordsmanship, given to reading Chinese works that justified the removal of rulers reputed evil. The murderer was punished by degradation, with hard labor for life.

A severe earthquake visited Awomori prefecture Aug. 10.

Marquis Sho Tai, formerly King of the Loo-Choo Islands, died in Tokio Aug. 19, in his fifty-seventh year, and with his death ended the last of the dual sovereignties of Asia.

In September an exhibition of the products of the porcelain districts was successfully held in Tokio.

Appropriate weather—alternate rain and sunshine, with steady prevalence of damp heat and absence of storm—in September, caused the rice-crop to be about 12 per cent. above the average, and the largest since 1892.

A memorial service in honor of President McKinley was held in Holy Trinity Cathedral, Tokio, the Mikado sending Prince Kanin as his representative, he having already ordered by telegram a wreath for the funeral in Canton, Ohio.

The Emperor's birthday, Nov. 3, was celebrated at the palace with unusual gaiety, the imperial grandson being one hundred and ninety days old. The sixteenth session of the imperial Diet opened Dec. 10, at which the Emperor made the usual speech. The lower house, in its reply, Dec. 11, declared there were indications of a disturbance in the Orient in the near future, and pledged itself to discharge its duties with circumspection.

JEWS. The year has been without especially eventful incident, but many occurrences of more than passing interest may be chronicled. The situation in Europe was more tranquil than in previous years, apart from conditions in Roumania. In Russia, educational privileges have been curtailed, but the authorities have shown more just treatment, while the praise awarded to Jewish soldiers who were included in the Russian army of occupation in China proved gratifying. The Dreyfus agitation in France had one good result—in leading to the associations bill, which was aimed at reactionary clericals by whose influence Capt. Dreyfus was persecuted. Anti-Semitism, in the person of Max Régis, notorious for his ineffectual attempts at Jew-baiting in Algeria, was summarily discontinued. The formation of a Hilfsverein among the Jews of Germany—on a broader basis than its union of congregations—is a hopeful effort toward confederation, in self-defense as well as for benevolent purposes. In Austria-Hungary a marked decline in anti-Semitism was proved by the parliamentary elections, and in Vienna the feeling is less acute. Italy appointed Leone Wollemborg to its portfolio of Finance, and the corner-stone of a new synagogue in Rome was laid in the presence of thousands, not far from the spot where once the Jews were exposed to public odium. Roumanian conditions are still unpromising; the Berlin Treaty's guarantees are violated without redress, and thousands of Jews are obliged to emigrate to escape starvation. In Turkey the Sultan continues gracious, and the dedication of a new temple in Constantinople marks the increase in the Jewish community. The Zionist agitation is still prosecuted, with hardly as much enthusiasm as at first save among the most zealous adherents. The proceedings of the congress held toward the end of December are not yet reported, but the movement is being actively propagated, its chief following, however, being in Russia and Roumania, and among recent emigrants from those countries. The bicentenary of the London Portuguese Jewish congregation was marked by the issue of a volume devoted to its history by Dr. Gaster. Some uneasiness was expressed in Parliament and the press at the increase in Jewish immigration, but investigation showed that fears were groundless. The words of King Edward in reply to the deputation of English Jews to congratulate him on his accession were most significant: "It will always be my care to maintain and promote the extension of equal liberty to all races and denominations among my subjects." The work of the Jewish Colonization Society was continued in Russia, Palestine, and elsewhere, with special attention to technical, industrial, and agricultural pursuits. The colonies in Argentina made genuine advance; those in Palestine varied in their results. In the United States, the Sunday question agitation has not been without its effect on Jewish citizens. Attempts in Massachusetts

and New York to secure the privilege of open stores on Sunday to Jewish observers of the seventh day failed; it can not be said that the great majority of the Jews were in favor of exceptional legislation, but they wait their time until public opinion in general recognizes the need of more discrimination in Sunday laws. The publication of the first volume of the Jewish Encyclopedia was notable not only from the participation of Jewish and non-Jewish scholars and its being undertaken by a Christian publishing firm, but also as a sign of increasing interest in Jewish studies. The acceptance by Prof. Schechter (of Cambridge University) of the New York Jewish Seminary's directorship is another sign of educational progress. Dr. Schechter is a scholar of recognized authority, and is conservative in his views, and his appearance in the field marks an impending change in the character of American Judaism, if he is strong enough to resist his environment and restore the olden foundations which are passing away in the stirring currents of the time. The Jewish Historical Society is preparing for an American Jewish Historical Exhibition to be held next year in New York. The movement to confederate Jewish charities and have one collection only for all has succeeded in St. Louis,

Chicago, and Philadelphia. The National Farm School, near Philadelphia, and the Woodbine (N. J.) Agricultural School continue to meet success. The corner-stone of the new Mount Sinai Hospital was laid in New York and the Sanitarium of the Montefiore Home was opened at Bedford Station, New York. In Philadelphia the Home for Jewish Orphans was dedicated, in Cincinnati the Jewish Shelter Home, in Cleveland the Jewish Infant Orphan Asylum. Congregation Beth Ahaba, of Richmond, Va., celebrated its sixtieth anniversary, June 14; Congregation Gates of Prayer, of New Orleans, and Beth Elohim, of Brooklyn, their fiftieth anniversaries, May 10 and 17. The visit to America of M. Nissim Behar in the interests of the Alliance Israelite Universelle is arousing much interest in the work of that organization. The Jewish Publication Society introduced a new novelist in Martha Wolfenstein's *Idylls of the Gass*, and announces a new translation of the Psalms for early issue. Part XIII of Dr. Jastrow's Dictionary of the Talmud appeared, and Part II of M. Lazarus's *Ethics of Judaism*, and Nina Davis's *Songs of Exile*. Emma Wolf wrote *Heirs of Yesterday*. Rev. Dr. Philipson translated Dr. Wise's *Reminiscences*, and P. Wiernik issued in Yiddish a *History of the Jews*.

K

KANSAS. (See under UNITED STATES.)

KENTUCKY. (See under UNITED STATES.)

KOREA, or TA-HAN, a country in eastern Asia, between Russia and China. It occupies a portion of the mainland, with the peninsular part projecting toward Japan. Eleven miles of its northern frontier borders upon Russian territory, from which it is separated by Tumen river. The Ever-White mountain and the Yalu river divide it from Manchuria. Its area is estimated at 82,000 square miles. It was opened to commerce by treaty with Japan of February, 1876, and with the United States in 1883. The Koreans are larger than the Japanese, and finer-looking than the Chinese, but lack the moral stamina of either. By the official report of the census taken in 1900, the population is set down at 5,608,351, but these figures comprehend only those who are enumerated for revenue purposes. Estimates of the population by foreigners vary from 10,000,000 to 15,000,000. Females are greatly in the minority, because less care is taken of the girls in infancy and childhood. The Americans in Korea number 269—missionaries 162, miners 75, electricians 15, Government employees 10, merchants 7. The Koreans have a system of measurements and weights peculiar to themselves. The old perforated cash and new coinage are on the decimal system, the latter in name corresponding to dollar, dime, nickel, and cent; but the regulating coin of the country is the Japanese yen, worth 50 cents. In measurements of time there are the year, month, day, two-hour period, and *pun* or twelve minutes; but in the vernacular there is no word for minute or second, though Koreans in contact with Western people use native equivalents of our terms, even to the second. There are also linear, square, spherical, grain, and land measurements.

Government.—The Koreans claim Kija, an ancestor of Confucius, as the founder of their civilization in 1122. The present dynasty, which began the fourth great period of national development, arose in A. D. 1392, when Seoul, the capital, was founded. Since the Chino-Japanese War of 1894-'95, Korea has been an independent state,

paying no tribute to China or Japan. On Oct. 14, 1897, the King assumed the title of Emperor, naming his realm Ta-Han (Great Han, meaning all Korea, in distinction from the ancient San-Han, or Three Kingdoms, 9-960 A. D.), and in August, 1899, he promulgated a written Constitution, whose nine articles declare his own absolute power and the independence of Ta-Han. The Council of State and the ministries of the Royal Household—Finance, War, Justice, Agriculture, Education, and Home and Foreign Affairs—assist the sovereign. Over each of the 14 provinces a governor, and in each of the 360 districts a magistrate, presides. There is no navy apart from revenue vessels, but an army of 5,000 men is equipped and drilled in Western style. Japanese interests in the empire outweigh all others, but Russian influence is very great. The King celebrated his fiftieth birthday on Aug. 7, appropriating 200,000 yen for the celebration, the music being from a band of 27 pieces of native musicians under a German instructor. A thousand silver medals were cast in commemoration, the inscription being in the native *en-mun*, one of the most perfect alphabets in existence. On Aug. 18, the late Tai-Wen-Kun was raised to the rank of Wang or King.

Railways, Telegraphs, and Public Works.

—By American capital and contractors, the railway from the seaport of Chemulpo to Seoul, 26 miles long, has been finished and put in successful operation, including the 10-span steel bridge across Han river. The same Americans have built, and now operate, an electric railway, eighteen miles long, in and about Seoul, which is very popular with the natives. On July 20 work was begun on the railway between Fusan on the south-east coast and the capital, which passes over the line of the great Japanese invasion of 1592, and through a rich rice district. The line will run almost directly south from Seoul 125 miles, and then turn abruptly to the east, taking advantage of the river valleys and the gaps in the mountains. The Autumn Wind pass requires great engineering skill. One of the 31 tunnels is a mile

long. The total length is 287 miles, with 40 stations including terminals, and 20,500 feet of bridges. The plans require six years for completion. The capitalization is 25,000,000 yen, with power to issue debentures not exceeding 10,000,000 yen. A Japanese syndicate is building the road, the Government at Tokio guaranteeing interest on the bonds for fifteen years at 6 per cent. Work is proceeding at both ends. The railway to connect Seoul with Wiju, on Yalu river, to tap the coal and gold mining regions, has been surveyed, and the concession given to French engineers to use French material. Other important public works are the establishment in Seoul, with American capital and workmanship, of a powerful electric-light plant, near the East Gate, which furnishes 1,500 16-candle-power lights in the palace, besides illuminating the whole city. By the same American company, a system of water-works has been begun in Seoul. A reservoir holding 10,000,000 gallons pumped up by means of two great engines, supplying 5,000,000 gallons a day through a crib built in the center of the river Han, will supply 659 hydrants, each having 2 discharge-pipes. Seoul, once one of the filthiest cities in the world, has now some of the finest and cleanest streets in Asia. Since January, 1900, the Koreans, besides increasing their domestic postal service under French supervision, have added a foreign department. The business of the bureau of telegraphs for 1900 amounted to 72,443 yen, being an increase of 21,756 yen over 1899. Two lines of Japanese steamers ply between Japan and the Korean ports. A native Korean steamship company operated three steamers in 1899, with profitable results.

Finance.—The budget for 1901 shows the revenue to be 9,079,456 yen, and the expenditure 9,078,682 yen. A decree early in 1901 adopted the gold standard, fixing a new coinage of 20-, 10-, and 5-yen gold pieces, 50- and 20-sen silver coins, 5-sen nickel coins, and 1-sen copper coins. Japanese currency is largely used. The First Bank of Japan has substantial buildings of brick and stone in Seoul and Chemulpo. In the former city the American firm of Colbran, Bostwick & Co. are building a fine brick structure in Seoul for the bank for which they have a charter. At the seaport, the Hong-Kong and Shanghai banking corporation has an agency. In 1899 the circulation of Japanese money in Korea was in paper, 3,000,000 yen; gold, 10,000 yen; silver, 1,000,000 yen; making a total of 4,010,000 yen.

Trade.—Foreign goods reach Korea chiefly through Japan and Shanghai, but no detailed report of trade has been published for seven years. The chief item of American imports is petroleum, which in 1900 amounted to \$896,815. Next come mining supplies, of which \$150,000 worth was imported in 1899. Trade with the United States is increasing, American imports having doubled within twelve months. The Standard Oil Company has extensive warehouses at Chemulpo and Fusan. The total trade of Korea for 1900, including native imports and reshipments, was 27,490,388 yen, the imports amounting to 13,335,273 yen, the chief items being cotton goods, American kerosene, and sundries. The exports amounted to 9,439,867 yen, in which the chief items were rice, beans, fish, ginseng, wheat, hides, seaweed, skins, barley, bones, and gold, which latter amounted to 3,633,050 yen, compared with the export of gold in 1894 of 950,703 yen. The published returns of exclusively foreign trade for 1900 show a total of 19,380,327 yen: imports, 10,940,460 yen, and exports 9,439,867 yen; the business with Japan amounting to 15,473,710 yen, with China 4,549,

354 yen, and with Russia (or Manchuria) 356,361 yen.

Mining and Foreign Interests.—For ages the native gold seeker has washed the sands of the rivers and exported the gold-dust and the nuggets occasionally found on the surface or in the mountains. Scooping up sand in a wooden bowl, which had ridges cut round its inner surface, he caught the particles. In rock mining, even shafts have been sunk to a depth of 300 feet, following a vein of gold in its original matrix. The method was to build a fire on the rock. When it was very hot, the fire was drawn off and water thrown on, which broke up the rock and enabled the laborer to dig out a few inches of ore, which he crushed by means of stone hammers or rollers. The use of fire and the resulting smoke restricted him to the use of perpendicular shafts. At Wonsan the Americans have one 40-stamp mill, and two mills with 20 stamps in operation, with buildings and machinery for larger enterprises, about 70 foreigners and 3,000 natives being employed. The English mines are also prosperous. The Germans work at Kimsung. Concessions have also been granted to the Japanese and French to work the coal-, copper-, and gold-mines.

Open Ports.—Nine ports are open to foreign commerce. Chemulpo, from a cluster of fishermen's huts in 1883, has grown to a thriving city of more than 20,000 people, with lines of communication open in all directions into the interior. The Japanese, Chinese, Korean, and general foreign settlements make up the municipality. The Japanese number 4,500, with their banks, steamship and railway companies, and board of trade and rice exchange offices in stone and brick. Five hundred Chinese live in their own quarter. Many handsome solid buildings are in the foreign quarter, with club-houses, theaters, and hotels, besides active missionary establishments.

Wonsan, with a tidal rise of two or three feet, in the northeast, near the center of Korea's 650 miles of eastern coast line, on an inlet covering 40 square miles, with a fine climate, has 15,000 inhabitants. The native town has doubled in population since the port was opened in 1883. The Japanese, who number 1,600, have the foreign trade, which in 1900 amounted to 1,425,570 yen. About 40 Americans and Europeans are here. There are excellent steamer accommodations, and a telegraph to Sang-Gin, which was opened to foreign commerce in 1891. This, the poorest of all the ports, lies between Wonsan and the Tumen river. It has a tidal rise of 2 feet.

The harbor of Fusan is formed by several islands, the largest of which is Deer island, having a rise of tide of 7 feet. In December, 1900, 8,758 Japanese lived at this port, the trade of which in 1900 yielded to the Korean treasury 150,270 yen on imports, 158,249 on exports, and tonnage dues 9,245.

Mokpo, in Chulla province, the garden of Korea, was opened in 1897. The marshy foreshore has been reclaimed, fine buildings have been erected, and the Japanese steamers call here regularly. A sea-wall has been built, and the anchorage is excellent. A fine vein of coal has been discovered near by. At Pinnacle Rock, its western approach, Mokpo has a tide rising 20 feet. The harbor is at the mouth of the large stream, deep enough to float steamers of considerable draught more than 20 miles from its mouth.

Chinnampo, instead of a few straggling huts, has now a population of 15,000, exclusive of the Japanese and Chinese in the foreign concessions.

At Masanpo are 228 Japanese, 18 Russians, 2 Germans, and 41 Chinese.

Ping-Yang city, nearly demolished and deserted in the Chino-Japanese War, has now a population of 100,000, who are diligent and thrifty and profit by the great mining enterprises recently opened near them, and in the working of the coal that crops up almost everywhere around the city.

Kun-san is at the mouth of the Keum river. Its tide has a rise of 21 feet.

Politics and Events.—An anti-Christian uprising in February, led by the ultra-Confucianists, was nipped in the bud by the energetic action of the foreign representatives. The treaty between Korea and Belgium was ratified Feb. 23, in Seoul. The Korea branch of the Royal Asiatic Society, formed in October, 1899, have published two volumes of their Proceedings. On April 20 Baron P. G. von Mollendorff died at Ningpo. From 1882 to 1885 he was in the service of the Korean Government, and introduced many reforms, until the Koreans suspected him to be under the influence of Russia, and he was relieved Sept. 4, 1885. Rose island, dominating the harbor of Chemulpo, which had been bought by Japanese, was recovered by the Korean Government. A great outbreak in May in Quelpaert island, arising chiefly from the levying of excessive tolls, in which the adherents

of the French missionaries suffered, called for the despatch of a large military force and a French gunboat, which arrived after the troubles had been quelled. The eightieth birthday of the Emperor's mother was celebrated June 19 with great festivities. In carrying out the renovation of Seoul, much work has been done in the park near the great white marble pagoda, famed throughout Asia, which was erected in a monastery during the splendid Buddhist age, before Seoul was founded. The rice crop, owing to the omission of the usual rainy season, proved for the most part a failure. Export was for a time prohibited, and 300,000 bags of rice from Annam were imported. The Koreans on Kang-wa island have erected tablets to the memory of the slain at the hands of the Americans in 1871, when the marines and sailors from Rear-Admiral John Rodgers's fleet were led by Commander (now Rear-Admiral) Winfield S. Schley. A memorial service in honor of the late President McKinley was held in Seoul, Sept. 19, at which the diplomatic body was present in full force.

The year has been one of steady national progress and great activity and success among all the missionary bodies.

L

LIBRARIES, PUBLIC. The following statements include additions to the general summary published last year, as well as a review of some of the principal events of 1901.

Increase of Libraries.—Statistics collected by the United States Bureau of Education in 1900 show that there has been a remarkable increase of libraries in the past five years. The number of libraries of 1,000 volumes or more was found to be 5,383, containing 44,591,851 volumes. Comparison of these figures with those of the bureau's report in 1896 discloses an increase of 1,357 libraries and 11,539,979 volumes (almost 35 per cent.). While the North Atlantic division has 2,473 of these libraries (New York alone having 718, Massachusetts 571, and Pennsylvania 401) and more than half of the number of volumes, the largest gains have again been in the North Central (40 per cent.) and Western (38 per cent.) divisions, Oklahoma showing 379 per cent. increase, and Arkansas, Indian Territory, New Mexico, North Dakota, South Dakota, and West Virginia more than 100 per cent. each. The North Central division has 1,728 libraries and 11,211,710 volumes, the South Atlantic division 421 libraries and 5,303,237 volumes, the South Central division 374 libraries and 1,886,731 volumes, and the Western division 387 libraries and 2,779,596 volumes. There is an average of one library to every 14,118 persons, and 59 volumes to every 100 population (in 1896 the number was 47). In New York there are 103 volumes to every 100 of population; in Massachusetts, 236; in California, 120. Of these libraries 4 have over 500,000 volumes each, 3 between 300,000 and 500,000, and 47 between 100,000 and 300,000; 3,654 have fewer than 5,000 each. Financial statistics were given by some libraries. Of these, 1,016 received \$2,349,294 through State, county, or city appropriations; 988 received \$2,213,715 from taxation; 714 received \$1,198,955 from endowment funds; 962 received \$488,130 from membership fees and dues; 294 received \$50,742 from book-rents; 819 received \$551,522 from donations; and 1,474 received \$1,000,048 from sources not stated. The total income of 3,115 libraries was \$7,812,406. The ag-

gregate of the endowment funds reported by 645 libraries is \$25,267,643, and the value of buildings owned by 710 libraries is \$47,083,805. The amount expended for books in the year by 2,972 libraries was \$2,056,675.

The libraries having fewer than 1,000 and more than 300 volumes now number 3,878, and contain 2,018,658 volumes. This makes the number of all libraries having more than 300 volumes 9,261, with a total of 46,610,509 volumes, a total gain of 2,077 libraries and 12,014,251 volumes. There are, besides, several thousand libraries having fewer than 300 volumes each.

Gifts.—According to the report presented to the American Library Association, more than \$16,000,000 were given to American libraries in the year ending July 1, 1901. Some of the details will be found in the present volume under GIFTS AND BEQUESTS, but reference must be made here specially to Andrew Carnegie, whose gifts during the period in question reached the aggregate of \$11,219,500.

New York City's Library System.—The figures above include Carnegie's gift of \$5,200,000 to the city of New York for a system of 65 branch libraries, of which 42 go to the boroughs of Manhattan, the Bronx, and Richmond, to be controlled by the New York Public Library, the rest to Brooklyn. In New York city (borough of Manhattan) the New York Free Circulating Libraries (January, 1900), the St. Agnes Free Library (1901), and the Washington Heights Library (1901), have become circulating branches of the Public Library, and a State law makes it possible for any other circulating libraries to consolidate with the New York Public Library without further formality; similarly in Brooklyn, most of the smaller libraries have been brought within the fold of the Brooklyn Public Library. The establishment of 8 libraries in the public schools of Manhattan, controlled by the Public Library, is a move the results of which will be watched with interest. It brings the library into intimate relations with the schools.

Print Departments.—In 1900 the New York Public Library decided to establish a department

of prints, and Samuel P. Avery presented his remarkable collection of more than 17,000 etchings and lithographs to that institution. Since then, exhibitions of the works of Turner, Whistler, Rembrandt (loaned by J. Pierpont Morgan), and others have been held. Print departments are a recognized factor in large European libraries, such as the British Museum, the Bibliothèque Nationale, and the Hofbibliothek in Vienna. Many years of opportunities for purchasing on the spot, state aid, and, above all, appreciation of art—these have obviously been the advantages that made such large and fine collections possible. The taste for such things is of more recent date here. There is now a print department in the Congressional Library at Washington, and one in the Fogg Art Museum in Harvard University. The Boston Museum of Fine Arts has an excellent collection, and the Pennsylvania Academy of Fine Arts possesses about 60,000 prints. There are also private collectors of discriminating taste. Before the Public Library formed this new department, New York city had no public collection of prints. Mr. Avery's good example has already been emulated by Charles Stewart Smith, C. B. Curtis, and other donors. These accessions, together with the prints that were in the library before (coming from the Lenox, Duyckinck, Tilden, Ford, and other collections), form a noteworthy beginning. A certain amount of this material has a historical rather than an artistic interest. In fact, in an institution like this, the usefulness of prints is emphasized. Portraits, views of places and buildings, historical scenes, costumes, ships, vehicles, and the thousand and one other things that form documents for the social history of mankind, are to be found in a well-conducted print-room and form a store of material to be drawn upon by the artist, the historian, the author, the actor, students of various specialties, and the general reader as well. The fact that most prints can be put to such use does not detract from their artistic value.

LI-HUNG-CHANG, a Chinese statesman, born in Ho-Fei, Nganwei, Feb. 16, 1823; died in Peking, Nov. 7, 1901. He received the degrees of bachelor and master, and in 1847 that of doctor of the Han-Lin Academy. But his rapid rise to prominence and power was not due to scholarship and literary elegance, but to his association with Col. Gordon in the suppression of the Taeping rebellion. He was sent to his native province in 1853 to exercise the troops. He secured the services of Frederick T. Ward (an American) and Charles George Gordon; and when their trained troops with European arms turned the tide in favor of the Government he was made commander-in-chief of the imperial army, and he bore off the honors when the great danger to the dynasty was overcome by the final victory over the rebels in 1864. Although Gordon, to whose ability to organize and train the Chinese soldiers for real fighting the victory was largely due (Ward was killed in 1862), had promised the rebel leaders at Suchow their lives, he was overruled by Gen. Li, who gave orders that all should be killed. This perfidious act gained for him elevation in rank and political promotion. He was already Governor of Kiangsu, and in 1865 he was appointed viceroy of the two Kiang provinces. In December, 1866, he was nominated minister plenipotentiary, and in February, 1867, was made Viceroy of Hong-Kwang. He became a member of the Grand Council in 1868, was sent as imperial commissioner to Szechuen in 1869, and in August, 1870, in consequence of the Tientsin massacre, his diplomatic, political, and military abilities and special ac-

quaintance with Europeans and their methods won for him the appointment of Viceroy of Pechili, the metropolitan province. In this post he remained twenty-four years, during which he was practically Chancellor of the empire and guardian of the throne, retaining the confidence of the Empress Dowager, and having such a predominant voice in the counsels of the empire that, while his adherents and sycophants were innumerable, his foes were bitter and not few. In foreign affairs he had unchallenged control, and in the introduction of Western technical methods, in starting coal-mines, metallurgical industry, steamship navigation, telegraphs, and railroads, he took the foremost part. As governor and viceroy of the richest provinces he had amassed an enormous fortune through the Chinese custom of giving presents or bribes for promotion and other official favors; and when he was placed at the head of the capital province and became the strongest politician at court his revenue from gifts grew apace. In the capitalistic enterprises that he founded he embarked his own fortune freely, and saw to it that it did not diminish. With provincial and imperial funds he began a Chinese navy, and he engaged foreign officers to teach European tactics and the use of firearms to a corps of picked troops that he intended to be the nucleus of an imperial army able to meet European troops in the field. Arsenal and arms factories were established with foreign managers and technical instructors. He encouraged also schools of Western learning, and was himself a believer in the medical skill of foreign physicians. His intellect was as keen and critical, and as free from the trammels of heredity and environment, as that of any contemporary statesman. He was as confident as any Chinaman of the essential superiority of Chinese civilization, but was conscious of the military and political weakness of China, and was not alone in his desire and endeavor to make China strong enough to resist external foes. In the Korean crisis his diplomatic craft did not avail. He had to defy Japan in a matter that touched national pride and imperial prestige, and when the Japanese declared war and proceeded to invade Chinese territory the court looked confidently to him to crush the audacious manikins with his European-drilled troops. Although he was probably the only Chinese official who recognized from the beginning that the war was hopeless, he had to accept the post of commander-in-chief. His trained troops he did not send against the Japanese, but kept for the defense of Peking, together with the best of the Manchu regiments. He gathered the worthless provincial soldiery, whose officers had to fill out their ranks with vagabonds and criminals, to be food for Japanese powder in Manchuria while he could organize a more effective line of defense for the capital province. His fleet he made the best use of that he could, and his officers and gunners fought both well and ill according to their partial knowledge and imperfect training; but neither ships nor sailors could accomplish anything against the thoroughly modern Japanese navy. After defeat was acknowledged he had to bear the odium, but he escaped the usual fate of unsuccessful generals because there was no other diplomatist as capable as he of making terms with the victorious enemy. He was degraded, stripped of his yellow jacket and peacock plume, and sent into retirement for a brief season to save the face of the court, and then was recalled, though with lessened rank, and sent to Japan as minister plenipotentiary to treat for peace. He obtained better conditions than could have been got by any other Chinaman. At

the same time he secretly courted the interposition of the European powers, and by giving secret pledges to Russia gained what appeared to be a diplomatic victory when that power stepped in and, backed by Germany and France, forbade the retention by Japan of the Liao-Tung peninsula, which the Japanese were not unwilling to evacuate. He played Great Britain against Russia, but with all his craft could not prevent the seizure of naval stations by the powers when Russia took Port Arthur and began the Manchurian Railroad. His guiding influence at Peking passed over to reactionary Manchus, and he became again a provincial ruler. The Boxer outbreaks and the anti-foreign counsels at court he was not in the position or on the spot to prevent. The occupation of Peking by the allied troops proved to the anti-foreign Chinese that they were still unable to carry on war against Europeans. Li alone held the keys of Chinese diplomacy, and had never lost the confidence of the Empress Dowager, who owed her ruling position no less to him than he owed to her his advancement. During the crisis he appealed, with the other southern viceroys, to the powers to respect the sovereign rights and the territory of China. When he was first recalled to Peking the allies forbade his passage, and he had no intention of going at that moment. The British distrusted him as a friend of Russia; but the Russians did not trust him, knowing that he was alive only to the interests of China. When the conditions for the evacuation of Pechili had to be discussed, Li-Hung-Chang was appointed at the head of the Chinese commission, having full powers to treat with the foreign ministers at Peking. He was an invalid subject to crises that brought him to death's door; yet all the negotiations were conducted by him. It was his skill and authority in diplomacy that brought the powers and the Chinese court into final agreement. When Russia pressed on China during the joint negotiations the Manchurian convention, Li appealed in protest to the powers, and Russia deferred the matter till after the peace negotiations were concluded. Then the negotiations with Russia were resumed, and Li's death was said to have been caused immediately by the heat and anxiety with which he resisted some of the Russian demands at one of his conferences with the Czar's minister. Although he knew no European language, Li-Hung-Chang always was glad to meet eminent foreigners who visited China, and always impressed them with his fine presence and dignified manners, and interested them with his searching questions, his artful compliments, and his shrewd and humorous criticisms and broad philosophy. In 1896, after attending the coronation of the Czar, he made the tour of Europe and the United States, and was so accessible and genial wherever he went that no Chinaman was so well known abroad.

LITERATURE (FICTION), AMERICAN.

The utter futility of the perennial effort to deduce from literary phenomena a general law that shall change criticism from an art into a science becomes more apparent with every passing year. Aristotle, Plato, Sainte-Beuve, Emerson, Barrett Wendell, and the anonymous journalistic book reviewers have vainly sighed for a working formula that should sift the chaff of print from the wheat of literature, a golden rule of letters from which no appeal could be taken by author, publisher, or reading public. How ancient and how futile is this quest for an infallible touchstone that shall enable the critic to distinguish at once between the counterfeit and the real in any line of art is amusingly suggested by Rudyard Kipling in his satirical poem *The Conclusion of the Workshops*:

When the flush of a new-born sun
 green and gold,
Our father Adam sat under the tree and
 stick in the mold,
And the first rude sketch that the world had
 joy to his mighty heart,
Till the devil whispered behind the leaves, "It's
 but is it art?"

To the literary critic who glances casually back upon the output of American fiction during the opening years of the twentieth century comes, perhaps, the melancholy thought that "we know as much as our father Adam knew." We see novels that defy almost every recognized rule of fiction-writing winning the most astounding success from a commercial standpoint, while the judicious grieve and marvel at the seeming preference of the public for the bud to the blossom, for the fragment rather than the completed whole.

The conservative critic holds, to use a mathematical illustration, that the novel should be cubical in form, but, lo! Kipling, Bacheller, and others give it a linear demonstration, and point for vindication to their green laurels and yellow gold.

One of the perils, however, that the critic of contemporary fiction must avoid lies in mistaking striking exceptions for proofs of a general tendency. While it is true that the elongated character sketch or the amorphous presentation of local color masquerading in the garb of novels have won rich rewards for their authors and publishers, it is satisfactory to observe that fiction of a higher order, showing more regard for the traditional obligations of its own art form, has not failed of popular recognition. The applause won by Gilbert Parker's *The Right of Way* from both the public and the critics restores our faith in the ultimate triumph of the axiom, as true in art as in mathematics, that the whole is greater than any of its parts, that a fragment can never be anything but a fragment. *The Right of Way* is a novel—that is, it is an artistic presentation of human life, combining narrative interest, character drawing, and development, the interplay of physical and psychical forces in the forging of individual destinies; not disdaining the devices that beget suspense, nor the cumulative effects that produce both minor and major climaxes. Here is no overemphasis in the wrong place, no thrusting of too great a load upon the shoulders of a single character, no effort to make an environment do duty in place of a plot, or a quaint remark in dialect satisfy the reader's longing for an episode. It is not too much to say that Mr. Parker is one of the comparatively few successful novelists of the day who realize that they owe many obligations to their readers, that vivid description can not atone for lack of ingenuity in plot, nor one effective bit of character work satisfy the demands of a long novel.

"The strenuous life" is an expression that has come into general vogue of late. Uttered first by the President of the United States, who has demonstrated the efficacy of his practical philosophy, it has taken its place as a phrase that represents the intensity of modern effort in various lines of endeavor. That the young century has great work to do in old and new fields of activity is a creed to which the dominant nations of the earth unanimously subscribe. But for what we call modern progress we are still seeking a sanction. There are those who ask it from religion, those who demand it of science, and still others who

seek in literature the revelation that shall justify the varied, and seemingly cruel, activities of contemporary existence. Fiction has thus come to mean more to this generation than to our forefathers. We demand of it not merely amusement, but enlightenment; not that it shall simply tickle our jaded imaginations, but that it shall widen and clarify our vision of life. The novelist is no longer looked upon as a maker of toys—though many are the playthings of an hour that he puts forth—but, in his highest development, as a seer, a prophet, a guide, teacher, and, it may be, reformer. "Fiction," says Hamilton W. Mabie, "is unquestionably the most attractive and influential form through which men of literary genius express themselves to-day; and no fact of social significance, no human relationship, no class limitation, capacity, or condition, will escape the instinctive search for life which possesses this generation." In this search for life, and the ultimate significance of the phenomena of this life, the newer and higher realism is beginning to make itself manifest. In *The Octopus*, by Frank Norris, and in *The Portion of Labor*, by Mary E. Wilkins, we find a realism that is almost epic when compared with the tentative, tea-table realism of a school that saw and depicted clearly only the inessential, insignificant features of contemporary existence. It would be easy to point out glaring defects in either one of these products of a tendency in realistic fiction that promises much for the future. It does not require keen critical insight to find in Norris a habit of repetition that is at times annoying, nor to observe that he is not always masterly in the manipulation of his material. Neither is it difficult to grasp the fact that Miss Wilkins has sacrificed much of the strength of her powerful story for the sake of a conventional ending. These and other minor indictments may be justly lodged against the novels under discussion, but when every legitimate reservation has been made, it can still be said with truth that *The Portion of Labor* and *The Octopus* add much to the dignity of recent American fiction and stand forth as pioneer efforts in a broader and nobler realism than this country has yet produced.

The classification of Winston Churchill's *The Crisis*—from various points of view the most important American novel of the year—is somewhat difficult. Combining deftly both romance and realism, fact and fiction, historical personages and imaginary characters, it won success at a bound, and apparently promises to retain a permanent place among the few novels of the day that bid fair to be read by posterity. When it was announced that the brilliant young author of *Richard Carvel* was at work upon a novel dealing with the mighty tragedy of the civil war, to come forth under the all-embracing title of *The Crisis*, the hope was widely entertained that the heroic splendor of the nation's titanic struggle for preservation might find at last an adequate presentation in fiction. Now, if ever, was the long-heralded "great American novel" to be given to a people weary of watching and waiting for its advent. All the conditions seemed to be favorable to the fulfilment of this hope. In *The Celebrity* and *Richard Carvel*, Churchill had displayed many of the qualifications that must be possessed by the author who shall satisfy a self-conscious nation's craving for an epic tale that shall serve for all time as the American *Iliad*. Careful in his workmanship, always readable, and never hysterical, possessing the narrative gift and a firm grasp of the more obvious manifestations of character, in thorough touch with the whole history of the

nation's growth, broad in his sympathies, and harboring no narrow sectional prejudice, Churchill was splendidly equipped for the task that he had essayed. To say that *The Crisis* has not fully satisfied the high hopes of an appreciative public is not to assert that it is not a novel of which the author and the nation may well be proud. Its shortcomings are not a reproach to the writer, but serve to emphasize the impossibility of depicting upon a single canvas the multitudinous contrasts begotten by the most complex and stupendous national tragedy of modern times. Mr. Churchill's success has consisted in giving to us a very real and convincing presentation of various episodes in one of the rebellion's areas of high pressure, and of Lincoln, Grant, Sherman, and other leading actors in the great melodrama of the war. But is it unfair to the author of *The Crisis* to assert that to justify the all-embracing title of his story he should have followed the precedent established by European novelists who have made use of epic material, basing the outcome of his tale upon the result of some great battle that settled the fate not of a campaign but of a whole war? Could not Gettysburg have served in *The Crisis* the end accomplished by the battle of Borodino in Tolstoi's *War and Peace*? The question is asked not in a spirit of carping criticism, not in black ingratitude for what Winston Churchill has actually achieved, but to illustrate the generally accepted proposition that while *The Crisis* has won, and will always hold, a very high place among American historical novels, it has not said the last word in fiction concerning the war of the rebellion.

The Cavalier is another tale of the civil war that must be mentioned among the notable books of the hour. Its author, George W. Cable, has held for many years a foremost position among American novelists. Perhaps, when his work is considered in its entirety, he may be placed by future critics in the highest place among the American fictionists of this generation. But it is safe to say that his strongest claim to the regard of posterity will not be made by his latest novel, brilliant in many ways as *The Cavalier* unquestionably is. While several of the situations in the story, handled with the deftness of a master of tale-telling, are equal in power and interest to any to be found in his earlier novels, the book as a whole is more conventional and less characteristic and convincing than *The Grandissimes*, *Dr. Sevier*, or *Old Creole Days*. One feels in reading *The Cavalier* that its author has made concessions to contemporary demands by the public somewhat in defiance of the dictates of his real genius. Nevertheless, Mr. Cable's novel is a striking and most readable contribution to the fiction of a year that has not been rich in the work of writers whose fame time has guaranteed as genuine.

There is danger that a critic, as was said above, may mistake delusive exceptions for a general tendency, and it is especially difficult for one who reviews the published fiction of a given year to make safe generalizations that shall serve to clarify the present outlook and to throw a gleam of light upon the immediate future. If, as has been intimated above, American fiction has shown of late a tendency toward a more comprehensive and exalted realism than it has yet known, it has, upon the other hand, displayed this year a marked enthusiasm for what is somewhat vaguely called the romantic school. With its insistence upon an adequate interpretation through novels of the life of to-day, the reading public demands at the same moment new tales of old times, a

modern representation in fiction of the polychromatic and intensely human past, for the strenuous life, but recently named though it may be, has been lived for countless generations, and a hero is a hero whether he died in velvets at Versailles or survives in khaki at Manila. The historical romance, bitterly assailed by intensely conscientious opponents as a bastard form of literary art, still ruffles it with the best-selling books of the day. In fact, the prince, the swashbuckler, the king's favorite, the cardinal, the colonial governor, the exile from court and the courtier in exile, have been much in evidence this year, undergoing all kinds of shocking adventures, but carrying themselves with more reverence for the obligations of time and space than their ancestors, sprung from the pen of the elder Dumas. Romance has made this concession to realism of late, that it forswears all manifestations of hysteria and submits to the despotism of the multiplication table. It also seeks self-justification in an increasing regard for the historical sources from which it obtains its working material, and, other things being equal, prefers an established fact to a flight of fancy. The liberties taken with history by Dumas, Scott, G. P. R. James, and other romancers of a former generation, would be considered sacrilege by Weyman, Doyle, Mary Johnston, and Bertha Runkle. The last name mentioned, by the way, has become widely known this year through one of the most readable of recent historical romances, a story cleverly constructed, brilliantly sustained, full of action but not devoid of those delicate touches that are so often lacking in tales of adventure. The *Helmet of Navarre* has won its notable success through its legitimate claims to a high place among novels of the romantic school. When an author in these days daringly harks back to the shop-worn times of Henry of Navarre to tell a new tale of a period that has seen much service in the cause of fiction, the chances of failure are many. In *The Helmet of Navarre*, however, Miss Runkle has avoided the Scylla of imitation upon the one hand and the Charybdis of too much novelty on the other. Conforming to the obligations that she was under both to the historians and to her readers, she has written a novel that has been received with enthusiasm by the devotees of romance and by those more catholic readers of fiction who can derive satisfaction from George Gissing one day and from Stanley J. Weyman the next.

It is an interesting fact that while in England men are writing the most successful of the historical tales, in the United States women are winning most of the prizes offered by the romantic school of fiction. Mary Johnston's high place among the romancers of this generation is well assured, and her latest story, running serially this season in the *Atlantic Monthly*, promises to achieve the vogue gained by her *Prisoners of Hope* and *To Have and to Hold*. Sarah Orne Jewett, in *The Tory Lover*, has employed Revolutionary material to advantage, telling a tale of Paul Jones and his times that is sustained in interest and charmingly related. But the garden of romance has not been abandoned wholly this year to the discriminating enthusiasm and skill of American women. In *Cardigan*, Robert W. Chambers has given to his innumerable admirers a fascinating tale of adventure dealing with the efforts of Sir William Johnson to defeat the American Tories in their attempt to win various tribes of Indians to the cause of the King just before the outbreak of the Revolutionary War. Mr. Chambers, since the publication of his striking tale, entitled *The King in Yellow*, ten years

ago, has maintained a very high average of achievement in fiction. *Cosmopolitan* in his environments, equally at home in Europe or America, possessing a fertile fancy that rises in some of its manifestations to the height of genius, Mr. Chambers has gained for himself a prominent and permanent place among the writers of this generation. His latest work is a valuable contribution to the growing list of American historical romances and is entitled to more than passing notice among the novels of the year.

Joseph A. Altsheler continues to strengthen his position among the American novelists who gain inspiration from the heroic pages of our nation's past. Sympathetic, American in every fiber, in command of the technique of story-telling, his tales possess a fascination that is hard to analyze but the reality of which the public was quick to recognize and reward. His most recent work, *In Circling Camps*, finds Mr. Altsheler, in line with Cable and Churchill, making use of a part of the inexhaustible material bequeathed to the teller of tales by the civil war. This story of a great campaign is ingeniously woven and in it the reader comes upon much of the best work that this promising author has yet done.

In *D'ri* and *I*, Irving Bacheller has taken advantage of the vogue of his *Eben Holden* to win another popular success. Both of these stories possess striking merits and glaring defects. In the judgment of many seekers after the light that succeeds in literature, there has been nothing in the history of recent literature more surprising than the applause that has greeted Mr. Bacheller's later novels. That they possess an elusive, indefinable charm to a vast number of not too critical readers is clearly proved. In what that charm consists it is not easy to say. It may lie partially in the author's frank simplicity of style or altogether in the effective quaintness of his leading characters. Without the weaving of complex plots and in open defiance of many of the conventions of the art of novel writing, Mr. Bacheller has won the laurel wreath of success. And it would be unfair to this author and an unwarrantable comment upon the taste of the public to assert that his popularity is not justifiable. It is, indeed, no small achievement in literature to divide the novel readers of a great nation into two hostile camps, and if Mr. Bacheller finds that the tents of his admirers vastly outnumber those of their opponents he may well feel pleased with his remarkable feat.

No account of the year's literary activities would be complete without a grateful reference to the additions made by Henry Van Dyke to that short list of recent books that appeal both to the general public and to the daintiest and most conservative of literary epicures. Few are the contemporary writers of fiction whose style is inspired with that invaluable quality that we call distinction, that delicate aroma of a pleasing personality that makes itself felt in ways that we can not follow to their source, now manifesting itself in a delicate sense of word-values, now finding expression in a characteristic phrasing of a sentence, and always and delightfully dominant over the thought itself. There is no living American writer who displays this rare quality of style in a larger measure than the author of *The Ruling Passion*, a series of short stories that demonstrate anew Dr. Van Dyke's marvelous versatility. That he finds the time and energy to accomplish so much that will take a permanent place in American fiction is a cause both for astonishment and rejoicing.

Sarah P. McLean Greene is not a prolific writer,

so far as the public knows, but a novel from her pen is an affair of considerable importance to those who appreciate the vigor and delicacy, the romance and the realism, of her *Vesty of the Basins*. *Flood-Tide*, her latest novel, is worthy of its author. Dealing with the crude life of the fisher-folk of the Maine coast, it exhibits the same uncommon merits that have won for *Vesty of the Basins* a success more to be desired than the ephemeral popularity achieved of late years by many lesser novels that have in them no element of permanence.

After all, are we not forced to the conclusion that in our heart of hearts we are more grateful to the man or woman who gives us a convincing picture of some phase of contemporary American life than to the author who begets even the most brilliant romance dealing with the men and manners of a remote past? Duffield Osborne's *The Lion's Brood*, a vivid and scholarly tale of Hannibal's invasion of Italy, has added much to the enviable reputation of the author of *The Robe of Nessus* and *The Spell of Ashtaroth*. But while the title of "the George Ebers of America" is well worth winning, is it not a fact that Owen Wister, Charles W. Chestnutt, John Uri Lloyd, John Fox, Jr., Booth Tarkington, and others who are conscientiously and often brilliantly adding to the fiction that interprets American life in its varied phases to-day, are doing work that is of more insistent significance than any that the best-equipped writer of historical romance can accomplish? Whatever may be the answer to this question—and the answer depends largely upon the consideration whether the individual looks at fiction through the large or the small end of the telescope—it is safe to assert, in conclusion, that this year's production of American novels demonstrates the fact that there is nothing of narrowness in our national literary genius; that it is catholic in its choice of the media through which it seeks expression, and that in every department of fiction it has of late put forth either the flower of fulfilment or the bud of promise. Gazing as we now are at the foundation stones, we realize that the American fiction of the twentieth century is to rise to splendid heights, a glorious structure built upon old lines but with many new and impressive ornamentations.

LOUISIANA. (See under UNITED STATES.)

LUTHERANS. The Lutheran Church in America, with its ministrations in more than a dozen different languages, is a polyglot communion of growing strength. Its growing literature in English, together with its 75 English periodicals, will doubtless bring it into such publicity as will enable all who are interested in the progress of religion in the United States to become better acquainted with its character and operations. According to the latest statistics, gathered for the *Lutheran Church Almanac*, the Lutheran Church numbers 62 district synods, 6,914 clergymen, 11,425 congregations, and 1,705,185 communicant members, an increase over last year of 200 clergymen, 300 congregations, and 40,000 members. There are 4,034 parish schools, 3,994 teachers, and 190,095 pupils; 5,725 Sunday-schools, with 52,601 officers and teachers, and 570,129 scholars. The purely benevolent offerings for missions, education, and works of mercy, exclusive of contributions for local work, amount to \$1,185,958.92, an increase over last year of \$15,000. There are 114 institutions of learning, of which 23 are theological seminaries, 48 colleges, 32 academies, and 11 ladies' seminaries, with property valued at \$5,638,560, endowment amounting to \$1,660,452, libraries with 313,880 volumes, em-

ploying 818 professors and instructors, and having 12,990 students, of whom more than 2,500 have the ministry in view. There are 97 charitable institutions, of which 18 are hospitals, 43 orphanages, 17 homes for the aged, 8 deaconess institutions, and 11 immigrant and seamen's missions, with property valued at \$4,623,029, endowment amounting to \$522,269, and providing shelter and care for 35,632 inmates; or a total of 211 educational and benevolent institutions, having property valued at \$10,261,589 and endowment amounting to \$2,182,721, a total money value employed by the Church in furthering its various activities of \$12,444,310. This is all the more remarkable if we consider the fact that most of these institutions have been established within the latter part of the century just closed, and that none of them, except one, have been the recipients of large gifts from individuals. They have been built up with the small gifts of the people.

The Lutheran Church in this country is divided, not so much on account of doctrinal differences as on account of language and territory, into 4 general bodies, embracing 47 of the 62 district synods. There are not 19 different kinds of Lutherans in America, though there are 19 synodical bodies. Their differences are linguistic rather than doctrinal. Following is a brief summary of the statistics of the general bodies and independent synods:

GENERAL BODIES.	Number of synods.	Number of ministers.	Number of congregations.	Communicant members.
General Council.....	10	1,306	2,068	362,409
General Synod.....	24	1,210	1,561	198,575
Synodical Conference	5	2,079	3,755	590,987
United Synod, South.	8	206	405	57,958
Independent synods..	15	2,113	4,636	515,256
Total	62	6,914	12,425	1,705,185

Among the 15 independent synods are several large Scandinavian and German synods that are not yet sufficiently Anglicized to be identified with any of the 4 general bodies in the diversified interests of the Church at large. The Lutheran population in the United States and Canada numbers about 9,000,000, and that of the world about 65,000,000. Two of the general bodies held conventions in 1901.

General Synod.—This is the oldest general body of Lutherans in America, having been organized in 1821. It embraces 24 district synods, nearly all of which are composed of English congregations, and has a membership of 1,210 clergymen, 1,561 congregations, and 198,575 communicants, and 1,514 Sunday-schools with 195,137 pupils. The benevolent offerings for the year amounted to \$312,128.21. It has under its care and control 5 theological seminaries or theological departments in colleges, and 5 colleges. It is the largest English body of Lutherans in America.

The fortieth biennial convention of this body was held at Des Moines, Iowa, May 29 to June 6, 1901. The opening sermon was delivered by the retiring president, the Rev. Samuel F. Breckenridge, Sc. D., D. D., professor in Wittenberg College, Springfield, Ohio. The 24 district synods were represented by 120 clerical and 116 lay delegates, a total of 236. The Rev. William S. Freas, D. D., of Baltimore, Md., was elected president; the Rev. William E. Fischer, D. D., of Shamokin, Pa., secretary; and Louis Mauss, Esq., of Cincinnati, Ohio, treasurer. The principal business of the convention consisted in considering and acting on the reports of the boards by which the various

operations of the body are carried on in the interim.

Foreign Missions.—The thirty-first biennial report of the Board of Foreign Missions was read by the Rev. George Scholl, D. D., of Baltimore, Md., secretary of the board. The board has charge of missions in India and Africa. The total receipts for this work were \$120,254.72. Of this amount the district synods contributed \$62,399.89, the Woman's Missionary Society \$24,160.81, the Sunday-schools, \$22,148.51, and from legacies were received \$2,804.54. For the famine sufferers in India \$23,881.13 was received. The total expenditures, exclusive of the amount received for famine relief, were \$97,253.68. During the two years embraced in this report, the missionary force in India, with Guntur in the Madras presidency as the central station, consisted of 11 ordained American missionaries, 5 subpastors, 17 catechists, 100 assistants, 4 Bible and tract colporteurs, and 54 helpers. These labored in 607 villages, having 432 organized congregations and 139 chapels. The baptized membership is 17,811. The mission also engages 11 woman missionaries, 23 Christian and 29 secular teachers, in 16 schools, with 1,057 pupils; and 15 Sunday-schools, with 761 pupils. The medical department is in charge of two physicians and has a hospital and dispensary. The famine in India in 1900 called for special efforts on the part of the board and the missionaries in the field. Already toward the close of 1899 the dark cloud of famine began to lower over the great Indian Empire, with its 300,000,000 souls, and before March 1, 1900, the country was in the grip of the most terrible famine known in its annals. At the call of the India Conference the board issued an appeal to the Church for \$5,000 or \$7,000 for famine relief. The appeal was no sooner made than funds began to flow in until the board had received \$23,888.13, and the work of feeding the hungry began. The missionaries threw themselves into the work with energy, and no worthy case within their reach was overlooked. Large camps were established, and the most generous provision was made for the needy. About 60,000 persons were fed.

The work in the Muhlenberg mission, Africa, was carried on under great disadvantages. Four missionaries died of African fever, leaving only a few laborers in this important field and suggesting the necessity of abandoning the field. Owing to the disturbed condition of the mission, no reliable data can be given concerning this part of the work. The mission in India is in a flourishing condition, and has fine prospects for continued success.

Home Missions.—The sixteenth biennial report of the Board of Home Missions was presented by the secretary, the Rev. A. Stewart Hartman, D. D., Baltimore, Md. The total receipts for this work, including a small balance in the treasury, were \$101,342.57. Of this amount the district synods contributed \$66,055.38 and the Woman's Missionary Society \$11,758.77. The expenditures amounted to \$94,090.38. The report of the fifteenth biennium showed an enrolment of 141 missions. Of these, 3 were dropped, and 28 new fields were added, making the total number assisted by the board, during the whole or part of the time covered by this report, 166, an increase of 6 over the preceding two years, and the largest number ever aided in any single biennium. These are located as follow, as to States: California, 8; Colorado, 5; District of Columbia, 1; Illinois, 9; Indiana, 8; Iowa, 7; Kansas, 14; Kentucky, 3; Maryland, 9; Michigan, 3; Missouri, 2; Nebraska, 17; New Jersey, 6; New Mexico, 1; New York,

14; Ohio, 16; Pennsylvania, 39; South Dakota, 1; West Virginia, 2; Wyoming, 1.

Church Extension.—The sixteenth biennial report of the Board of Church Extension was presented by the secretary of the board, which showed receipts amounting to \$113,044. The total assets of the board are \$366,677.79. The number of appropriations made during the biennium, either as gifts or loans, was to 266 congregations.

Publications.—The assets of the Publication Society, including a well-equipped publication house in Philadelphia, are valued at \$161,242.12. The society publishes Sunday-school and missionary periodicals, of which the monthly issues number 300,000 copies. The society issued, in the period covered by the report, 14 new books, 14 new editions of books previously published, and 12 books published for the authors, making a total of 40 books.

Education.—The eighth biennial report of the Board of Education was presented by the secretary, the Rev. Henry C. Haithecox, D. D., of Columbia City, Ind. The board supports Midland College and the Western Theological Seminary, at Atchison, Kan. These institutions, established a few years ago, are doing excellent work for the Church in the West. About one-third of the pastors in the synods of Kansas and Nebraska are graduates of the college and the seminary. The German department is gaining in favor and is meeting the most sanguine expectations of its friends. Carthage College, at Carthage, Ill., has also been aided by the board. Hartwick Seminary, New York, is a link through which the synods of New York have cooperated with the board in its important and far-reaching work. The aggregate value of the property of these institutions is \$264,000. The receipts for this work, as reported by the board, amounted to \$26,993.67.

Deaconess Board.—The pastor of the Mother House of Deaconesses, at Baltimore, Md., the Rev. Frank P. Manhart, D. D., reported a steady development of the deaconess work in the general synod. There has been progress in the training-force, improvement in the equipment of the institution, and an advance in the grade of work. The mother house has 14 deaconesses, 9 probationers, and 2 candidates. The regular out-stations have been New York city, York, Pa., Tressler's Orphanage, and parish work in Baltimore. A new property has been acquired for the institution at Baltimore, at a cost of \$26,850, once the home of Roger B. Taney, Chief Justice of the United States, on which are buildings that will accommodate this growing institution for some time to come.

Miscellaneous.—The other business of the convention consisted in considering reports of various standing committees. Among these were reports of the National Lutheran Home for Aged, at Washington, D. C., which has property valued at \$50,000, and has cared for 16 inmates; the orphanage at Loysville, Pa., with property valued at \$75,000 and 175 inmates; the Sunday-school work; and statistics. The synod authorized the appointment of a representative to act with two others, one each from the General Council and the United Synod of the South, in holding a "Free General Conference." A conference of this kind has since been called to meet in Philadelphia, March 25, 1902. In response to the proposition made by the official visitor from the general council, a committee was appointed to consider in what ways the synod may enter into practical co-operation with the general council "without committing either body to any entangling alliances,

sacrifice of principles, or interference with synodical identity."

The next convention of this general body will be held in Baltimore, Md., beginning June 3, 1903.

General Council.—This body—composed of English, German, and Swedish congregations and pastors—was organized in 1867, and embraces 10 district synods, 1,305 clergymen, 2,068 congregations, and 362,409 communicants; 478 parish schools, with 617 teachers and 24,940 pupils; 1,733 Sunday-schools, with 16,012 officers and teachers and 213,019 pupils. The benevolent offerings for the year amounted to \$278,469.30. Under the direct control of this general body or its district synods are 3 theological seminaries, 7 colleges, 2 academies, 7 hospitals, 14 orphanages, 4 deaconess institutions, 6 homes for aged and helpless, and 2 immigrant missions, involving a property value of more than \$4,000,000.

The twenty-eighth convention was held at Lima, Ohio, Oct. 10-15, 1901. The opening sermon was delivered by the president, the Rev. Mattis C. Ranseen, D. D., Swedish pastor in Chicago.

There were 87 clerical and 49 lay delegates present at the convention. One newly organized synod—the Pacific—was received. The Rev. Mattis C. Ranseen, D. D., was reelected president; the Rev. Solomon E. Ochsenford, D. D., professor in Muhlenberg College, Allentown, Pa., was elected English secretary; the Rev. Gottlieb C. Berke-meier, D. D., of Mount Vernon, N. Y., German secretary; the Rev. Frank A. Johnsson, of Chicago, Swedish secretary; and William H. Staake, Esq., of Philadelphia, Pa., treasurer. Interest in the convention was increased by the presence of the Right Reverend Bishop Knute Henning Gezelius von Schule, Ph. D., D. D., LL. D., Bishop of Visby, Sweden, who presented the greetings of the Swedish Church and of King Oscar, in the German language, and after spending a day at the convention took his leave, giving his farewell in the English and Swedish languages. Among other things he said: "We do not wish to be bigoted. We are willing and desirous to learn from any and every portion of the Christian Church, but whatever we may learn from others, we can not, dare not, will not give up the Lutheran faith."

The principal business of the convention consisted in considering and acting on the reports of boards and committees, a brief *résumé* of which is here given:

Foreign Missions.—The report of the Board of Foreign Missions was presented by the Rev. William Ashmead Schaeffer, D. D., of Philadelphia. The mission is in the Madras presidency, India, with the city of Rajahmundry as its central station. It has 7 principal stations, with 330 out-stations, in which are laboring 5 ordained missionaries, 3 missionaries' wives, 5 zenana sisters, 2 native pastors, and 140 evangelists, catechists, and teachers. Two missionaries resigned in the past year and have returned to this country. On account of some difficulties connected with the work, the Rev. Frederick W. Weiskotten, of Philadelphia, was sent to India to inspect the field. He left in the early summer of 1900, inspected the various mission stations, and set out on his homeward voyage, but died at sea, Dec. 15, 1900. The work has been greatly hampered by the removal of workers, and the need of the mission is a larger force of missionaries. Two native pastors have been ordained recently, but still the force of efficient workers is not large enough to do the work demanded in the vast territory occupied by the mission. The work is divided into four departments—preaching the Gospel, gathering chil-

dren into the schools, visiting zenanas, and caring for the sick and needy. The Gospel is preached in 200 villages, in which are 6,159 Christians, 3,500 children are taught in the schools, and arrangements are in progress for the establishment of a hospital and dispensary in Rajahmundry. During the period covered by the report 1,157 persons were baptized and 225 confirmed. The receipts for this work were \$51,185.08, and the expenditures \$43,605.86.

In addition to the work in India, the General Council began missionary operations in Porto Rico in October, 1899. Two stations are occupied—San Juan and Catano—by one missionary and his wife, and one teacher. One English congregation has been established in San Juan, having 30 members, and services are held at Catano. The two Sunday-schools of the mission have 145 pupils. The receipts for this work were \$3,076.95, and the expenditures \$3,039.76. At this convention of the General Council the work in Porto Rico was entrusted to a special board, to be prosecuted with more vigor than could be done by the board, whose chief field of operation is in India.

Home Missions.—The home-mission work of this body is carried on by three general boards—English, German, and Swedish—and by the district synods in their respective territories. The English board sustained 22 missions in 10 States, with a membership of 2,336, who contributed \$1,501.41 to benevolent purposes, \$22,007.44 to local objects, and own church properties valued at \$176,750. The receipts for this work were \$44,632.44 and the expenditures \$44,596.56. The German board sustained 74 missions, with a membership of 3,634, chiefly in the Northwestern Territory of Canada and the States of Oregon and Washington. The receipts were \$8,090.40, and the expenditures \$8,039.37. The Swedish board reported 308 missions, with a membership of 10,760, in numerous States and Territories and in the Dominion of Canada, sustained at an expenditure of \$100,000. The entire home-mission work of the General Council embraces 287 missionaries, 615 missions—English, German, Swedish, Norwegian, Danish, and Slavonian—with a membership of 33,787 and 26,343 Sunday-school pupils, the missions owning property valued at \$1,520,834, and for whose support the sum of \$225,000 was expended in the past two years. Of these missions 168 are English, 136 German, 308 Swedish, the rest Danish, Norwegian, and Slavonian. They are located as follow: Alabama, 2; Alaska, 1; California, 5; Dominion of Canada, 84; Colorado, 11; Connecticut, 8; Delaware, 1; District of Columbia, 1; Florida, 6; Idaho, 4; Illinois, 30; Indiana, 8; Iowa, 9; Kansas, 7; Kentucky, 1; Maine, 4; Maryland, 1; Massachusetts, 8; Michigan, 19; Minnesota, 55; Missouri, 6; Montana, 7; Nebraska, 20; New Hampshire, 1; New Jersey, 24; New York, 37; North Dakota, 11; Ohio, 22; Oregon, 21; Pennsylvania, 127; Rhode Island, 2; South Dakota, 11; Texas, 11; Utah, 6; Vermont, 1; Washington, 11; West Virginia, 3; Wisconsin, 28; and Wyoming, 1; total, 615.

Publications.—The board has vigorously pushed its work in the line of publishing the official English organ of the council, a complete series of Sunday-school literature, embracing more than a dozen different publications, and the Church almanac in a greatly improved form, together with English and German publications of great value to the Church and the world. The receipts of the board were \$94,221.20. The board has secured a permanent location in Philadelphia, where a publication house has been established. To this must be added the large and well-equipped

Augustana Book Concern, the printing and publication house of the Augustana Synod, at Rock Island, Ill., whose receipts for the year 1900 were \$80,441.18.

Miscellaneous.—Other matters considered by the council at this convention pertained to the deaconess work, the Sunday-school work, cooperation with the other general bodies of the Church, provision for a more careful oversight of educational matters, and for a more thorough study of Lutheran church music.

M

MCKINLEY, WILLIAM, twenty-fourth President of the United States; born in Niles, Ohio, Jan. 29, 1843; died in Buffalo, N. Y., Sept. 14, 1901. The story of his life, up to his first inauguration, March 4, 1897, is told in the Annual Cyclopædia for 1896, page 428, and his portrait is the frontispiece of that volume.

On March 6, 1897, the President issued a proclamation calling an extra session of Congress for March 15, and on that date he sent in a special message on the subject of the tariff. The result was the measure called "the Dingley bill," after Chairman Nelson Dingley of the Ways and Means Committee, which passed both branches of Congress, and by the signature of the President became a law.

After the passage of this bill there was a decided revival of prosperity. Many mills that had been closed resumed work, and there were other indications of returning confidence in the business world.

On May 17 the President sent to Congress a special message, asking for an appropriation for the aid of suffering Americans in Cuba, and in accordance therewith \$50,000 was appropriated for that purpose. The policy of the new administration toward Spain on the Cuban question had been a matter of much speculation. It soon became evident that it was to be marked by calmness and moderation. The President retained in office Consul-General Fitzhugh Lee, who had been appointed to his post by President Cleveland, although he sent a commissioner to Cuba to report to him on special cases; and the policy of the Government in relation to the suppression of filibustering remained unchanged. Gen. Stewart L. Woodford, the new minister to Spain, was instructed to deliver to the Spanish Government a message in which the United States expressed its desire that an end should be put to the disastrous conflict in Cuba, and tendered its good offices toward the accomplishment of such a result. To this message the Spanish Government returned a conciliatory reply, to the effect that it had ordered administrative reforms to be carried out on the island, and expected soon to put an end to the unfortunate war, at the same time begging the United States to renew its efforts for the suppression of filibustering.

As was generally expected, the opening of the administration was marked by a fresh agitation of the question of Hawaiian annexation. A new treaty of annexation was negotiated and was sent by the President to the Senate, but action upon it was postponed. Meanwhile the Japanese Government lodged a remonstrance against any such action on the part of the United States as might prejudice the permanent rights alleged in favor of the Japanese under the terms of the treaty between Japan and the republic of Hawaii or adversely affect the settlement of the diplomatic dis-

The next convention of this body will be held at Mansfield, Ohio, October, 1903.

The other two general bodies—the Synodical Conference and the United Synod of the South—held no conventions during the year. The latest accessible reports of their status and work are given in the Annual Cyclopædia for 1900. The large independent Scandinavian synods held conventions, and in the reports published give evidence of continued progress in their educational, missionary, and benevolent operations.

pute then pending in regard to the charged violation by Hawaii of the provisions of that treaty. The Japanese minister having disclaimed any ulterior unfriendly purpose of Japan, either in respect to the dispute or to the proposed annexation, the good offices of the United States were successfully employed with the Hawaiian republic to compose the controversy by the payment of a money indemnity to Japan, which amicably closed the incident before the final annexation of the islands to the United States. This was effected on Aug. 12, 1898, by the act of the Hawaiian President in yielding up to the representative of the Government of the United States the sovereignty and property of the Hawaiian Islands, in accordance with the terms of a joint resolution of Congress, approved July 7, 1898, whereby the purpose of the annexation treaty was accomplished by statutory acceptance of the offered cession and incorporation of the ceded territory into the Union.

A prominent incident in foreign affairs was a despatch sent by Secretary Sherman to Ambassador Hay, at London, regarding the Bering Sea seal question, which was criticized because of the recital of the facts of the preceding award of the Paris Bering Sea Commission and the discussion which followed in order to show that Great Britain stood committed to a revision of the Paris rules for the regulation of seal-catching. On July 15 it was announced that Great Britain had finally consented to take part, with the United States, Russia, and Japan, in a sealing conference in Washington in the autumn of 1897; but later Lord Salisbury declared that he had been misunderstood, and the conference convened in November without British delegates, although Sir Wilfrid Laurier, the Canadian Premier, was present unofficially.

In the summer of 1897 the reports of great gold discoveries on the Klondike river in British territory near the Alaskan boundary caused much excitement, recalling, especially on the Pacific coast, the days of the early California gold-fever. So many expeditions set off almost at once for the north that the administration found it necessary to warn persons of the danger of visiting the arctic regions except at the proper season and with careful preparation; and to preserve order in Alaskan territory near the scene of the discoveries the President established a military post on the upper Yukon river. On April 7, in response to a message from the President asking for relief for the sufferers by flood in the Mississippi valley, Congress appropriated \$200,000. Much favorable comment was caused at the beginning of the administration by President McKinley's evident desire to make himself accessible to the public. On April 27, accompanied by his Cabinet, he attended the ceremonies connected with the dedication of the Grant Monument in Riverside Park, New

York, and immediately afterward he was present at the dedication of the Washington Monument in Philadelphia.

President Cleveland, in his last annual message, had stated plainly the position of the United States on the Cuban question, saying that the suppression of the insurrection was essentially a matter for Spain, that this country would not fail to make every effort to prevent filibustering expeditions and unlawful aid of any kind for the rebels, but adding the warning note that a time might come when intervention would be demanded in the name of humanity, and that it behooved Spain to end the struggle before this should become necessary. This was hardly a statement of party policy, but rather the expression of the sentiment of the whole country, and after the first year of the new administration it was seen that its policy had been much along those lines. In his note of Sept. 23, 1897, Gen. Woodford had assured the Spanish Minister of Foreign Affairs, the Duke of Tetuan, that all the United States asked was that some lasting settlement might be found which Spain could accept with self-respect, and to this end the United States offered its kindly offices, hoping that during the coming month Spain might be able to formulate some proposal under which this tender of good offices might become effective, or else that she might give satisfactory assurances that the insurrection would be promptly and finally put down.

A change in ministry took place in Spain, and the Liberals succeeded to power. The new Foreign Minister, Señor Gullon, replied to the American note on Oct. 23, suggesting more stringent application of the neutrality laws on the part of the United States, and asserting that conditions in the island would change for the better when the new autonomous institutions could go into effect. This measure of self-government was proclaimed by Spain on Nov. 23, 1897. The insurgents rejected it in advance; the Spanish Cubans who upheld Weyler's policy were equally vigorous in denouncing it; the remainder of the population was inclined to accept it, as it was in lieu of anything better, although it fell far short of what they had been led to hope for. It stipulated, among other things, that no law might be enacted by the new Legislature without the approval of the Governor-General; Spain was to fix the amount to be paid by Cuba for maintenance of the rights of the Crown, nor could the Cuban Chamber discuss the estimates for the colonial budget until this sum had been voted first; furthermore, perpetual preferential duties in favor of Spanish trade and manufactures were provided for. The formal inauguration of the system took place in January, 1898, but it was evident that there were irreconcilable differences between the members of the ministry as well as between their followers, although a certain well-wishing toward the new measure was manifested by the insurgent party, many of them returning from the United States or coming from the field of hostilities to submit themselves under Marshal Blanco's proclamation of amnesty; yet early in January, 1898, the Spanish party broke out in such serious demonstrations and rioting against the autonomists and the Americans in Cuba that Consul-General Lee recommended the sending of an American man-of-war to Havana, as much for the moral effect of its presence as for the protection of American property there in the imminent and unfortunate contingency of disturbance.

The tone of the press in the United States had been growing more serious. The failure of the autonomous constitution was evident, the mili-

tary situation was growing worse, the loss of life on the part of the helpless non-combatants caused by the reconcentration policy of Weyler was daily more appalling; it was clear that the situation was nearing a crisis. Señor Canalejas, editor of a Madrid paper, made a voyage to Cuba at this time, to see the actual position. He stopped in the United States, called on his friend Dupuy de Lôme, the Spanish minister at Washington, and then went to Havana. Soon after the departure of Canalejas, De Lôme wrote him a private letter, in which he criticized severely the policy of the President in regard to the Cuban question, and characterized him as a vacillating and time-serving politician. This letter, obtained surreptitiously, was published widely in the press on Feb. 8, and later the original letter was communicated to the Department of State. The following day Señor de Lôme, in a personal conference with Assistant-Secretary Day, admitted its genuineness, said he recognized the impossibility of continuing to hold official relations with this Government after the unfortunate disclosure, and added that on the evening of the 8th, and again on the morning of the 9th, he had telegraphed to his Government, asking to be relieved of his mission. Immediately after this conference a telegraphic instruction was sent to Gen. Woodford to inform the Government of Spain that the publication in question had ended the Spanish minister's usefulness, and expressing the President's expectation that he would be immediately recalled. But before Gen. Woodford could present this instruction the Cabinet had accepted the minister's resignation. Three days later Gen. Woodford telegraphed to the department a communication from the Minister of State expressing the sincere regret of his Government at the act of its representative. On Feb. 17 Señor Polo y Bernabe was appointed to succeed Señor Dupuy de Lôme as Spanish minister to the United States.

The excitement caused in the United States by this incident was still fresh when it was quickened into deeper and graver feeling by the destruction of the United States battle-ship *Maine* in the harbor of Havana. After the riots in January, 1898, Consul-General Lee had asked for an American man-of-war to protect the interests of this country. The Spanish authorities were advised that the Government intended to resume friendly naval visits to Cuban ports; and they replied, acknowledging the courtesy, and announcing their intention of sending in return Spanish vessels to the principal ports of the United States. The *Maine* reached Havana on Jan. 25, and was anchored to a buoy assigned by the authorities of the harbor. She lay there three weeks. Her officers received the usual formal courtesies from the Spanish authorities, and Consul-General Lee tendered them a dinner. The sailors of the *Maine* did not receive shore liberty, owing to the ill-disguised aversion shown to the few officers who went ashore. The treatment of officers and crew by the Spanish authorities was perfectly proper outwardly, although no effusive cordiality was shown. At forty minutes past nine o'clock on the evening of Feb. 15, while the greater part of the crew were asleep, a double explosion occurred forward, rending the ship in two and causing her to sink instantly. Out of a complement of 355 officers and men, 2 officers and 258 men were drowned or killed and 58 were taken out wounded. Capt. Sigbee telegraphed a report of the occurrence to Washington, and asked that public opinion be suspended until further details were known. Marshal Blanco informed Madrid that the explosion was due to an accident caused by the bursting of a dynamo-

engine, or combustion in the coal-bunkers. The Queen-Regent expressed her sympathy to Gen. Woodford, and the civil authorities of Havana sent messages of condolence, but no official expression of regret was then made by the Spanish Government. When the naval court of inquiry reached Havana the local naval authorities offered to act with them in investigating the explosion, but the offer was declined. Thereupon Spain made an independent investigation. The conclusions of the American court of inquiry were that the explosion was not due to the officers or crew, but that it was caused by a submarine mine underneath the port side of the ship. The court found no evidence fixing the responsibility upon any specified person or persons. It was not until several weeks later, when the findings of the American court had been announced, and the heat of popular sentiment made war inevitable, that the Spanish Government protested to Gen. Woodford against our *ex-parte* investigation, alleging that a verdict so rendered was unfriendly, and asked that a joint investigation or else a neutral examination by expert arbitrators should be made to determine whether the explosion was due to internal or external causes. This proposal was declined by President McKinley. The investigation conducted independently by the Spanish Government found that the explosion on the Maine was accidental and internal.

War was now only a question of time. On March 7 two new regiments of artillery were authorized by Congress, and on March 9 \$50,000,000 for national defense, to be expended at his discretion, was placed at the disposal of the President. This action was hailed with enthusiasm throughout the country and commanded wide-spread attention and admiration abroad. The speeches of Senator Proctor and others who had visited Cuba carried great weight. The President asked for a bill providing a contingent increase of the army to 100,000 men, which was passed at once. Spain on her part put forth every effort to reinforce the army in Cuba and to strengthen the navy. On March 23, after the President had received the report of the naval court of inquiry, Gen. Woodford presented a formal note to the Spanish minister warning him that unless an agreement assuring permanent, immediate, and honorable peace in Cuba was reached within a few days the President would feel constrained to submit the whole question to Congress. Various other notes were passed in the next few days, but the Spanish notes were regarded by the President as dilatory and entirely unsatisfactory.

On April 7 the ambassadors or envoys of Great Britain, France, Germany, Italy, Austria, and Russia called on the President and addressed to him a joint note expressing the hope that humanity and moderation might mark the course of the United States Government and people, and that further negotiations would lead to an agreement which, while assuring the maintenance of peace, would afford all necessary guarantees for the re-establishment of order in Cuba. The President, in response, said he shared the hope the envoys had expressed that peace might be preserved in a manner to terminate the chronic condition of disturbance in Cuba so injurious and menacing to our interests and tranquillity, as well as shocking to our sentiments of humanity, and while appreciating the disinterested character of their communication, he expressed the confidence of this Government, that equal appreciation would be shown for its own earnest and unselfish endeavors to fulfil a duty to humanity by ending a situation the prolongation of which had become insufferable.

The Queen-Regent directed that Gen. Blanco should be authorized to grant a suspension of hostilities, the form and duration being left to his discretion, to enable the insurgents to submit and confer as to the measure of autonomy to be granted to them. This was a very different thing from assent to the President's demand for an armistice from April to October, with an assurance that negotiations for independence should be opened with the insurgents. No real armistice being offered, there was nothing for the Cubans to decline. This evasive outcome of the labors of the President for two months caused him to abandon all hope of an adequate settlement by negotiation, and to send in his message of April 11, in which he reviewed the negotiations at length and ended by leaving the issue with Congress.

On April 13 a resolution was passed by the House authorizing the President to intervene to pacify Cuba. On April 16 the Senate amended the House resolution by striking out all except the number, and substituting a resolution recognizing Cuba's independence. April 19 these two resolutions were combined in a joint resolution, which was adopted by both houses after a bitter struggle. This resolution was approved by the executive the next day. Spain assumed to treat the joint resolution of April 20 as a declaration of war, and sent Gen. Woodford his passports about seven o'clock on the morning of the 21st, before he could communicate the demands of the resolution. In the United States it was assumed that by dismissing Gen. Woodford Spain initiated actual war, wherefore Congress, by an act approved April 25, declared "that war exists, and that war has existed since the 21st day of April, A. D. 1898, including said day, between the United States of America and the Kingdom of Spain." In like manner the Spanish decree of April 23 simply recites in Article I "the state of war existing between Spain and the United States," without assigning a date for its beginning. The President's proclamation of April 26 coincided with the Spanish decree of April 23 in adopting for the war the maritime rules of the Declaration of Paris.

By the end of the month the troops called for under the act of April 23, authorizing the President to call for 125,000 volunteers, had begun to concentrate at Tampa, Fla. On April 30 Congress authorized a bond issue of \$200,000,000, and a circular was issued the same day inviting subscriptions. The total of subscriptions of \$500 and less was \$100,444,560, and the total in greater amounts than \$500, including certain proposals guaranteeing the loan, amounted in the aggregate to more than \$1,400,000,000.

Orders for a blockade of Cuba were issued on April 21, and the blockade was established and proclaimed the next day. In his proclamation of April 26 the President set forth at length the principles that would govern the conduct of the Government with regard to the rights of neutrals and the other points of naval warfare. The nation had scarcely realized the existence of war when it received news of Dewey's magnificent victory at Manila. This event fired the national heart with enthusiasm, and added immensely to the prestige of our navy abroad. On May 4 Admiral Sampson's squadron sailed from Key West; and on the 12th it engaged the forts at San Juan de Porto Rico. This was but a reconnaissance to discover whether the fleet under Admiral Cervera was in port; for the object of the navy was to destroy the Spanish fleet that had left the Cape Verde Islands on April 29. On May 19 Commodore Schley's flying squadron sailed from Key West

for Cienfuegos. On the same day the Navy Department was informed of Cervera's presence at Santiago, and this information was transmitted to Commodore Schley at Cienfuegos through Admiral Sampson. Commodore Schley then proceeded to Santiago. Sampson joined Schley on June 1, and assumed command of the entire fleet. On June 10 600 marines were landed near the harbor of Guantanamo, where they successfully repelled repeated attacks by the Spaniards. On June 14 Gen. Shafter, with 16,000 men, embarked for Cuba, under escort of 11 war-ships. The troops arrived off Guantanamo Bay on the 20th, and began landing on the 22d at Daiquiri, 17 miles east of Santiago, the entire army being debarked by the 23d with only 2 casualties. The forward movement was begun at once; after a sharp action near La Quasima on the 24th, in which the Americans under Gen. Wheeler lost 16 killed and 52 wounded, on July 1 the heights of El Caney and San Juan near Santiago were stormed. In the two days' fighting at this point the loss of the United States troops was 230 killed, 1,284 wounded, and 79 missing. On the morning of July 3 Cervera, after peremptory orders from Gen. Blanco, took his fleet to sea from its sheltered position in the harbor. The blockading vessels closed in upon the Spanish ships immediately upon their appearance, following them closely as they turned in flight to the west, and by evening had sunk or disabled every one of them, losing but 1 man killed and 10 wounded, while the enemy lost about 350 killed and 1,670 prisoners.

After a demand for unconditional surrender of Santiago, which was refused, and a truce of several days, on the 10th and 11th firing was resumed from the trenches and the ships, and by evening of the latter day all the Spanish artillery had been silenced. Terms were settled on the 17th, when the United States troops took possession of the city. On the 21st Gen. Miles sailed with an expedition to Porto Rico, where he landed on the 25th. His progress through the island met with little resistance, the inhabitants turning out to welcome the invading troops as deliverers. In less than three weeks the forces of the United States rendered untenable every Spanish position outside of San Juan; the Spaniards were defeated in six engagements, with a loss to the invaders of only 3 killed and 40 wounded, about one-tenth of the Spanish loss.

On July 26 Jules Cambon, the French ambassador at Washington, was requested to inquire if peace negotiations might be opened. President McKinley replied on the 30th, stating the preliminary conditions that the United States would insist upon as a basis of negotiations. A protocol of agreement was signed on Aug. 12 by Secretary Day and Ambassador Cambon, in which the stipulations were embodied in six articles, fixing, besides, a term of evacuation for the West Indian islands, and naming Oct. 1 following as the date of meeting of commissioners to settle the terms of peace.

It now became necessary to withdraw as many of the United States troops as possible from the unhealthful situation in Cuba. A camp was hastily provided near Montauk Point, Long Island, and hither the troops were hurried from Cuba. Suffering could not be avoided, of course, and there was a cry that the troops were not receiving the careful attention they deserved. President McKinley made a personal visit to Montauk in August to satisfy himself as to the actual state of affairs. In September he appointed a commission to investigate the charges of criminal neglect of the soldiers in camp, field, hospital, and

transport, and to examine the administration of the War Department in all its branches. The commission met first on Sept. 27. Gen. Miles, in his testimony, described the beef furnished to the troops as "embalmed," and in reply on Jan. 12, 1899, Commissary-Gen. Eagan denied the charge, and made such a bitter personal attack upon Gen. Miles that the President ordered his trial by court-martial, with the result that he was found guilty of conduct unbecoming an officer and a gentleman, and sentenced to dismissal from the army. This was commuted by the President to suspension for six years. The commission made its report on Feb. 8, and on Feb. 9 a court of inquiry was appointed by the President to investigate the charges of Gen. Miles in relation to the beef supply. The court found that his allegations were not sustained.

On Aug. 26 President McKinley appointed William R. Day, Cushman K. Davis, William P. Frye, Whitelaw Reid, and George Gray as peace commissioners. John Bassett Moore was appointed secretary and counsel. The commissioners met the Spanish commissioners in Paris on Oct. 1. Negotiations continued until Dec. 10, when the treaty was signed. It provided for the relinquishment by Spain of all claims of sovereignty over and title to Cuba; the cession of all other Spanish West India islands, and of Guam in the Ladrone group; the cession of the Philippines to the United States, and the payment to Spain by the United States of \$20,000,000 within three months after the exchange of ratifications of the treaty; Spanish soldiers were to be repatriated at the expense of the United States. Other details settling property rights were also included. On Jan. 4, 1899, the President transmitted the treaty to the Senate, where it was referred to the Committee on Foreign Relations. In his annual message, Dec. 5, the President had contented himself largely with a simple narrative of events that led up to the war, suggesting his own theory as to its causes, and deferring all discussion of the future government of the new territories until after the ratification of the treaty of peace. He recommended also careful consideration of the provisions suggested by Secretary Alger and Mr. Hull, chairman of the House Committee on Military Affairs, for enlargement of the regular army. The President had an opportunity to impress his views upon the country less formally, but none the less effectively, in his speeches and addresses on his trip to the Omaha Exposition in October and his visit to the Atlanta Peace Jubilee in December, 1898. There was much opposition to the treaty in the Senate, but finally it was ratified.

The question of peace with Spain was now settled, but an outbreak in the Philippines opened a new problem. The President had appointed, in January, 1899, a commission of five, consisting of Admiral George Dewey, Gen. Elwell S. Otis, President J. G. Schurman, of Cornell, Prof. Dean C. Worcester, of the University of Michigan, and Col. Charles Denby, for many years United States minister to China, to study the general situation in the Philippines and to act in an advisory capacity. But when hostilities broke out, there was left to him but one thing to do: the insurrection must be put down. For this reason he gave Gen. Otis, in his policy of vigorous action, all the support possible.

Another difficulty arose in the condition of affairs in the Samoan Islands. After the death, in 1898, of Malietoa, King of Samoa, a struggle for the succession took place in the islands between the followers of Mataafa and those of young Malietoa. For ten years Germany, Great Britain,

and the United States had exercised joint control over the islands. This position of the three powers, coupled with the continuous fighting among the natives, seemed to promise a serious problem for the President, but by perfect coolness and uniform good judgment he brought the matter to a satisfactory issue. On the proposal of Germany, each of the three powers appointed one member of a commission to visit the islands and investigate the entire question, beginning with the return of Mataafa and the election of 1898. Bartlett Tripp was appointed by the United States, Baron Speck von Sternberg by Germany, and C. N. E. Eliot by Great Britain. The commission unanimously recommended the abolition of the kingship and radical changes in the administration of Samoa. The three powers, recognizing the inexpediency of continuing any tripartite government of the islands, agreed upon an arrangement by which England retired from Samoa in view of compensation made by Germany in other quarters, and both powers renounced in favor of the United States all their rights and claims to the islands east of 171°, including Tutuila, with the fine harbor of Pago-Pago.

The President's appointments for the delegation to represent the United States at the peace conference called by the Emperor of Russia in 1898, which assembled at The Hague in May, 1899, were favorably received. The delegation consisted of Andrew D. White, ambassador at Berlin; Stanford Newel, minister to Holland; Seth Low, president of Columbia University; Capt. Alfred T. Mahan, United States navy (retired); and Capt. William Crozier, United States army. Frederick W. Holls, of New York, was appointed secretary.

Of domestic events in the first half of 1899 one of the most important was the order of May 29 in which the President withdrew several places in the civil service of the Government from the operation of the system of appointment on the result of examinations conducted by the Civil Service Commission. The President found a strong supporter and defender in the Secretary of the Treasury, who contended that the order was a beneficial step for the reform of the civil service; that only those places had been exempted that experience had shown could be filled best without examination, and that the change had not been made in the slightest degree at the instance of the spoilsmen. The President and Mrs. McKinley spent the summers of 1897 and 1899 at a popular resort on Lake Champlain, and in August of the latter year the President made an eloquent address at the Catholic Summer School, Cliff Haven, N. Y., in the course of which, referring to the condition of affairs in the Philippine Islands, he said: "Rebellion may delay, but it can never defeat the American flag's blessed mission of liberty and humanity." Later, at the Ocean Grove Assembly, New Jersey, he remarked: "There has been doubt expressed in some quarters as to the purpose of the Government respecting the Philippines. I can see no harm in stating it in this presence. Peace first, then, with charity for all, the establishment of a government of law and order, protecting life and property and occupation for the well-being of the people, in which they will participate under the Stars and Stripes." The President's message in December, 1899, was cordially received and very generally commended throughout the country.

During 1900 the volume of currency per capita was the greatest in the history of the nation; the total money of the country on Sept. 1 was more than \$2,096,000,000. Industrial and agricultural conditions advanced in prosperity in every section

of the United States. Under these conditions the nation became a money-lending instead of a money-borrowing country.

The original Philippine commission, created by President Jacob G. Schurman, submitted its final report on Jan. 31, 1900. On Feb. 6, the President selected Judge William H. Taft to head a new commission, which was completed by March 16, and reached Manila on June 3. The laborious endeavors of the Taft commission began to bear fruit, and on Sept. 1, under its direction, civil government was inaugurated in the archipelago. A vital death-stroke was dealt to the insurgents by the capture of the rebel dictator, Aguinaldo, in March, 1901, by Gen. Funston and a small band of men, who achieved success through stratagem and disguise.

Early in the summer of 1900 the civilized world was startled by news that the foreign legations at Peking, China, were besieged by an angry horde of celestials. A secret society, commonly known as "Boxers," had determined upon the extermination of all foreigners in the Chinese Empire. The events which began with the destruction of the forts at Taku and ended with the capture of Peking by the allied forces of Europe and the United States in August are a matter of contemporary history, in the making of which President McKinley and the United States played a conspicuous part. The President's moral influence for justice and fairness to China in her difficulties, resulting from the rashness of her misguided rulers and people, was marked.

Among the more important measures which Mr. McKinley forwarded in 1900 and early in 1901 were the following: An established government for Porto Rico and the Philippines; the redemption of the pledge of the United States to Cuba for the inauguration of independent civil rule in the island; reorganization of the army of the United States; extension of the American merchant marine; construction of the Nicaragua Canal; and the signing of reciprocity treaties with various European powers.

At the Republican National Convention, held in Philadelphia in June, 1900, President McKinley was unanimously renominated for a second term, and Theodore Roosevelt, then Governor of New York, was likewise nominated unanimously for the vice-presidency. Their Democratic opponents were, respectively, William Jennings Bryan and Adlai E. Stevenson. At the election on Nov. 6 the Republican candidates were elected, having carried 28 States with 292 electoral votes. Their plurality of the popular vote was nearly 250,000 greater than in 1896. The members of the Cabinet were all reappointed, but in March, 1901, Mr. Griggs resigned, and was succeeded by Philander C. Knox, of Pennsylvania, as Attorney-General. On April 29, accompanied by Mrs. McKinley, his Cabinet, and other officials, the President left Washington on an excursion to the Pacific coast via New Orleans. On the day following, speaking at Memphis, Mr. McKinley said: "What a mighty, resistless power for good is a united nation of free men! It makes for peace and prestige, for progress and liberty. It conserves the rights of the people and strengthens the pillars of the Government, and is a fulfilment of that more perfect union for which our Revolutionary fathers strove, and for which the Constitution was made. No citizen of the republic rejoices more than I do at this happy state, and none will do more within his sphere to continue and strengthen it. Our past has gone into history. No brighter one adorns the annals of mankind. Our task is for the future. We leave the old century behind us,

holding on to its achievements and cherishing its memories, and turn with hope to the new, with its opportunities and obligations. These we must meet, men of the South, men of the North, with high purpose and resolution. Without internal troubles to distract us or jealousies to disturb our judgment, we will solve the problems which confront us untrammelled by the past, and wisely and courageously pursue a policy of right and justice in all things, making the future, under God, even more glorious than the past."

Early in the autumn of 1901 the President, accompanied by Mrs. McKinley and several members of his Cabinet, visited the Pan-American Exposition at Buffalo, N. Y. On Thursday, Sept. 5, he delivered an address embodying the ripest wisdom of his long and prosperous political career. It gathered the experience of his many years of service to the country, and announced in clear, strong language the policy that was to guide him in the future. The speech is not merely an expression of the personal views of the President; it is a sound statement of the actual problems involved in the new position that, under his own wise guidance, our country has assumed in the world. It is in a sense Mr. McKinley's legacy to his native land. On Friday afternoon, in the music-hall of the exposition, while receiving his fellow citizens, he was twice shot by an assassin, who was executed for the crime in the following month. The President lingered until early on Saturday morning, Sept. 14. Funeral services were held in Buffalo, and Thursday, Sept. 19, was by President Roosevelt appointed a day of mourning and prayer throughout the United States. On that day the body lay in state in the national Capitol, after which there was a public funeral. At the same time unprecedented honors were paid to the memory of Mr. McKinley in St. Paul's Cathedral and Westminster Abbey, London, and in other parts of the Old World. The dead President's body was temporarily laid to rest in Canton, Ohio, where his widow resides. Probably none of his predecessors during their terms of office enjoyed as great popularity as William McKinley, and it may be safely asserted that the death of no other President was so universally mourned among his countrymen. See *Speeches and Addresses of William McKinley*, compiled by Joseph P. Smith (New York, 1893); the *Life of Major McKinley*, by Robert P. Porter (Cleveland, 1896); and *Speeches and Addresses of William McKinley*, from 1897 to 1901 (New York, 1900).

MADAGASCAR, an island colony of France near the southeast coast of Africa, formerly a kingdom, proclaimed a French protectorate in 1885, and declared a French colony on Aug. 6, 1896. The colony is administered by a Governor-General, Major-Gen. Gallieni. The area of the island, with Diego Suarez, Nossi Bé, Sainte Marie de Madagascar, and the Îles Glorieuses, is estimated at 228,500 square miles. The total population according to a recent official estimate is 2,252,236, the natives being estimated at 2,250,000, besides whom there are 207 Africans, 589 Asiatics, 1,042 French, and 398 Mauritians and others. There were 760 French civil functionaries in 1900, and the troops in 1901 numbered 490 officers and 16,406 soldiers. The Hovas, a tribe of mixed Malay origin that formerly ruled the island, are estimated to number 1,000,000. Most of them are nominally Christian, the majority of them Protestants. Antananarivo, the capital, has about 260,000 inhabitants; Tamatave, the seaport on the east coast, and Majunga, on the west coast, about 6,000 each. Hindus and Chinese carry on the local trade in the towns and Arab trade on the

coasts. Slavery was abolished by proclamation in Imerina, the Hova province, and wherever French authority reaches, on Sept. 26, 1896. Of the troops 8,165 were Europeans and 8,241 natives of Madagascar. The chief judicial officers are French, with native judges in the lower courts. The Christians are estimated to number 450,000 Protestants and 50,000 Catholics. The missions carry on hospitals, orphanages, colleges, and about 1,800 elementary schools, with 170,000 pupils. The colonial French Government has instituted rural schools in which instruction is given in both French and Malagasy, and in provincial centers industrial and agricultural schools, with superior schools in which officials, teachers, lawyers, and physicians receive their training. The revenue for 1897 was 9,093,820 francs, and the expenditure 9,328,679 francs. For 1900 the local revenue was estimated at 11,972,000 francs, to which the French Government added a contribution of 1,800,000 francs to cover the estimated expenditures. The actual revenue in 1900 was 19,400,000 francs from all sources, and expenditure 17,100,000 francs, leaving a surplus of 2,300,000 francs to be added to the reserve fund. The revenue in 1901 was expected to reach 25,000,000 francs. For military expenditure in 1901 the sum of 29,147,100 francs is set down in the French budget, and the total expenditure of France in that year is put at 31,602,449 francs. The debt of the colony requires 2,625,000 francs a year for interest, including the new loan of 60,000,000 francs. The reserve fund in 1901 amounted to 5,000,000 francs. The local revenue has increased six and one-half times in five years. Madagascar is believed to be rich in minerals. Gold, copper, iron, galena, sulfur, graphite, and lignite have been found, and 300 claims have been filed, but the development of mines is slow because the law requires companies to be managed exclusively by Frenchmen. Concessions of land are granted to Frenchmen free and have been sold to foreigners. The forests abound in valuable woods, in caoutchouc, and other forest produce. The natives weave silk, cotton, and raffia fiber by hand, and are skilled in working metals. The value of imports in 1899 was 27,994,000 francs, against 21,641,000 francs in 1898; the value of exports was 8,046,000 francs, against 4,960,000 francs. The principal articles imported in 1898 were cloth for 8,513,000 francs; drinks for 2,702,000 francs, besides wine for 1,429,000 francs; flour, 423,000 francs; tobacco, 128,000 francs. The chief exports in 1898 were caoutchouc for 1,282,000 francs; cattle, 653,000 francs; hides, 637,000 francs; raffia, 561,000 francs; wax, 383,000 francs. The total general trade of Madagascar in 1900 was 51,000,000 francs, having nearly quadrupled in five years.

The port of Tamatave was visited during 1898 by 6,061 vessels, of 879,362 tons, 734,068 tons being French, 78,053 tons British, and 39,305 tons German. A railroad has been built from Tamatave to Ivondro, which is connected by a canal with Jaroka, whence the railroad will be carried to the capital. The lagoons along the east coast are being joined by canals. A telegraph-line, 180 miles in length, runs from Tamatave to the capital, and another from the capital to Majunga, connecting with a cable to Mozambique, giving communication with Europe. Antananarivo has telegraphic communication also with the chief towns of the interior. A road from Tamatave to the capital has been completed, forced labor having been employed in its construction according to the old custom of the country. Gen. Gallieni has promised to abolish the *corvée*, as well as slavery. A poll-tax was introduced in lieu of

the manual service formerly required by the Government. The change has been made gradually, and is not yet complete. The poll-tax has been increased, and to enable the natives to pay it they are given employment in Government workshops and private establishments at a franc a day. Hindu and Chinese coolies have been imported into Madagascar, the latter to work on the roads. Hindu merchants and Germans have acquired two-thirds of the trade on the west side of the island. In the south French traders and colonists are coming in and posts are being rapidly pushed forward. On the central plateau there is little to tempt European enterprise, while in the coast regions and the forests agriculture and commerce are making progress.

MAIL DELIVERY, RURAL FREE. As undertaken in the United States, this is the free delivery of mail at least once every week day to farmers, miners, and others living outside of cities, towns, and villages. It is not the "village delivery" recommended by Postmaster-General John Wanamaker in 1890, which was tried by him and discontinued after a trial of a little more than two years on a change in the national administration.

In 1885 John M. Stahl, who was then a regular writer for a dozen farm papers, began a persistent agitation for the free delivery of mail to farmers. Although the suggestion was generally received with ridicule, he succeeded, in three or four years, in having it rather widely discussed and in securing for it some friends. He introduced a resolution favoring it in the annual meeting of the Farmers' National Congress in 1891, which was adopted, and a similar resolution has been adopted by that organization at every annual meeting since. It is claimed for the Grange, however, that it was the first agricultural organization to advocate rural free delivery. However, the earliest support given to the suggestion was by city organizations and newspapers.

The movement for free rural delivery received a great impetus from the letter of Postmaster-General Wanamaker, transmitted to the Senate May 3, 1892, in response to a resolution calling on him for "all the information that may be on file in his office . . . relative to the question of extending the free-delivery system to rural communities or for substituting said system for that of the present star-route service, as the same may be found practicable." This letter, of 180 printed pages, contained extracts from editorials that had appeared in 472 periodicals in all parts of the country, advocating the free delivery of mail to farmers, and also a report on the results from the free delivery of mail in 48 villages, inaugurated by him under the authority of a resolution of Congress approved Oct. 10, 1890. These experiments showed, as stated by Postmaster-General Wanamaker, that "while an allowance for natural growth equal to the average annual increase in earnings has been made, the business of these experimental offices has further increased to an amount slightly over the additional outlay for free delivery." It was said by the advocates of free rural delivery that the experiments in free village delivery proved that the first-named would not add to the net expense of the Post-Office Department; for not only would free rural delivery make a large addition to the revenues of the department, but it would effect a large saving through the abolition of fourth-class post-offices and star routes. These views were presented with great energy and persistence, Mr. Stahl, who continued to lead the agitation, speaking before Chautauqua assemblies, the National Grange,

farmers' institutes, press associations, etc., and having articles published in more than three-fourths of the periodicals of the country, from the local paper using "patent insides" to the metropolitan dailies and the *North American Review*. He secured the approval of the then powerful League of American Wheelmen and the support of its official organ. Champions of free rural delivery became active in Congress, and \$10,000 were appropriated for the fiscal year 1894, \$20,000 for the fiscal year 1895, \$30,000 for the fiscal year 1896, and \$40,000 for the fiscal year 1897, for experimental work. Postmaster-General Bissell refused to make the experiments. He was succeeded by Postmaster-General Wilson, who established the first free rural-delivery route, from Charlestown, W. Va., Oct. 1, 1896. In October, 1896, 15 routes were established; 15 were established in the following month, and by May 1, 1897, the number was increased to 44. These routes were in 26 States and Territories, from Maine and Massachusetts to Louisiana and Arizona, and from Georgia to Minnesota and Washington. The results were so satisfactory that Congress made the appropriation for this work for the fiscal year 1898, \$50,000, and in 1898 the number of routes was increased to 128. The appropriation for the fiscal year 1899 was \$150,000; for 1900, \$450,000; for 1901, \$1,750,000; and for 1902, \$3,500,000. On July 1, 1899, 391 routes had been established; Nov. 1, 1899, 634 routes, serving 452,735 persons; June 30, 1900, 1,214 routes, serving 879,127 persons; Nov. 15, 1900, 2,614 routes, serving 1,801,534 persons; July 1, 1901, 4,298 routes, serving more than 2,500,000 persons; and on Dec. 1, 1901, 6,009 routes, serving about 4,000,000 persons. In his annual report, dated Nov. 25, 1901, Postmaster-General Smith said that by July 1, 1902, the number of routes will be increased to 8,000, serving 5,700,000 persons.

The first step to be taken by a community to obtain free rural delivery is to prepare and sign a petition addressed to the First Assistant Postmaster-General. The Post-Office Department recommends that the petition read as follows:

*To the First Assistant Postmaster-General,
Washington, D. C.:*

The undersigned, heads of families, residing in . . . county, State of . . . , respectfully ask that the Rural Free Delivery Service be extended to them, the delivery to start from . . . post-office, . . . county, . . . State, or such other point as the officers of the department may deem best adapted to the service. A map or rough sketch of the proposed route is herewith enclosed. Your petitioners are mostly (*here state vocations, such as farmers, truck-gardeners, dairymen, cattle-raisers, or whatever the chief occupation of the people may be*). The roads over the proposed route are (*state whether pike, graveled, or otherwise*). There are no unbridged creeks, and the roads are passable at all seasons of the year.

Opposite each signature should appear the number in family more than sixteen years of age, and the distance in miles from the nearest post-office. When properly signed, the petition must be sent to the Congressman in whose district the petitioners are located, or to one of the Senators from the State. If he recommends the petition and forwards it to the Post-Office Department, a special agent is sent to the locality, to map out a route, and to select a rural carrier and substitute, to be appointed by the department. In this work the advice of the Congressman from that district is sought.

No route will be established where the roads

are bad, or, under ordinary circumstances, that is less than 20 to 25 miles long, or that serves fewer than 100 families. The route is so arranged that the carrier will not be required to travel over the same ground twice on the same day. Those served must put up, at their own expense, boxes conforming to the requirements of the department. The carrier deposits mail in the boxes and takes mail from them, except registered mail, which must be delivered to the addressee. The carriers are required to take with them on their trips, for the accommodation of their patrons, a sufficient supply of stamps, stamped envelopes, and postal cards. If the carrier finds an unstamped letter in a mail-box, and with it money sufficient to pay the postage, he is instructed to affix the necessary stamps. Carriers are empowered to register letters and packages and to deliver the same, giving and taking receipts on forms provided. They are also authorized to accept money for money-orders, giving their receipt therefor; and, if the patrons of the delivery desire to make the carrier their agent for the purpose, the carrier may enclose the orders, when issued, in addressed envelopes confided to his charge, and mail them without returning the orders to the senders.

"The establishment of free rural delivery at any post-office does not change in any particular the rate of postage on any class of mail-matter received at or delivered from that office, except that the one-cent rate on drop letters does not apply when such letters are collected or delivered by rural carriers. Drop letters so collected or delivered must be prepaid at the rate of two cents for each ounce or fraction thereof."

Rural carriers were paid at first only \$150 a year, then \$300; in 1898 this was raised to \$400, and they now receive \$500 for an ordinary route, and for special short routes \$100 a year for each 5 miles traveled. They are bonded for \$500, and each carrier has a substitute bonded for the same amount, that the mails may never lack a responsible carrier. Good character and temperate habits are required. The civil service regulations never have been applied to this service. Women are eligible, and some have been appointed and have served acceptably.

The extension of rural free mail delivery is largely owing to the enthusiastic support of Postmaster-General Smith. It was he that developed the idea of extending the service over an entire county, suspending all other service, that the best evidence might be obtained on these points: 1. To what extent can free rural delivery supersede fourth-class post-offices and star routes? 2. What will be the effect on the postal revenues? 3. What the net cost to the Government, compared with the old system. Carroll County, Maryland, was selected as presenting average rural conditions, with the third-class post-office of Westminster as the distributing point. On Dec. 20, 1899, 163 minor post-offices and 35 services by star-route contractors and mail messengers were discontinued, and rural free delivery was substituted in their place. The Westminster service began with 4 2-horse postal wagons, each equipped with all the appliances of a traveling post-office, and each accompanied by a postal clerk empowered to issue money-orders, register letters, and deliver letters, and cancel stamps on letters collected. These wagons supplied mail at designated points to 20 rural carriers, for whom cross-routes were laid out, to bring all the territory embodied in the order within easy reach of the mails. During the first three months the cost of the service was \$4,543; the saving from service superseded was

\$2,805; the increase of postal receipts directly resulting from the increased accommodation was \$1,501.75, making the net cost of carrying the postal service practically to, or near to, the homes of all the people in this county for one-quarter of a year only \$263. Dec. 1, 1901, 10 complete county services had been established.

At suitable places on each rural free delivery route, chiefly at cross-roads, schoolhouses, and places of general resort, the placing of United States collection mail-boxes of the regulation pattern used in cities has been authorized.

While at first there was some opposition to free rural delivery, it has now practically vanished. Dec. 1, 1900, there were on file in the Post-Office Department 2,159 applications for routes not established. Dec. 1, 1901, the number of these applications was 6,129, or more than the number of routes established. Postmaster-General Smith says: "It has been made plain that this service is a potent educational force; that it brings agricultural life into far closer relations with the active business world; that it keeps the farmer in daily touch with markets and prices; that it advances general intelligence through the increased circulation of legitimate journals and periodicals, stimulates correspondence, quickens all interchanges, promotes good roads, enhances farm values, makes farm life less isolated and more attractive, and unites with other wholesome influences in checking and changing the hitherto prevailing current from country to city." Free rural delivery was commended by President McKinley in his last annual message.

In his last annual report the Secretary of Agriculture discloses a new function for free rural delivery. He says that particular attention has been given to the distribution of weather forecasts by the free rural delivery. There are now in operation 365 centers, supplying an aggregate of nearly 42,000 families in the farming districts with the latest weather predictions. He said that, with some additional appropriation, it is the intention to reach several hundred thousand farmhouses with the daily forecasts and warnings of the Weather Bureau during 1902. He points out that the value of frost and cold-wave warnings to rural communities is beyond estimate, and that the free rural delivery of the Post-Office Department places the means at command to reach those who will be the most benefited by these warnings.

In Great Britain there is substantially a house-to-house rural delivery, only the most inaccessible domiciles being left unvisited. The rural carriers generally travel on foot and walk from 15 to 18 miles a day. Their average pay is \$4.50 a week. The Government allows each \$5 a year for shoes, furnishes him with medical attendance when sick, and allows him to retire on a small pension after ten years of faithful service. Practically all France is covered by rural delivery, the service extending into every commune. Rural carriers travel on foot, are paid not quite 2½ cents a mile, and are required to cover their routes every day in the year. The length of a route is 10 to 15 miles. They have an allowance for clothing, and may retire on a pension after fifteen years of service. Germany has rural delivery, but the service is not exactly free. Extra postage is charged, part of which goes to the carrier and part to the Government. In addition, the carrier is paid about \$240 a year. In Austria-Hungary the rural carrier is hired by the local postmaster. He collects a fee of half a cent on all letters, and of an eighth of a cent on all newspapers delivered by him. He travels about 10 miles a day, always

on foot, and his average pay is \$120 a year. In Belgium the rural carrier makes a daily round trip of 15 or 16 miles on foot. His salary varies with the supposed cost of living in the district he serves. It never exceeds \$250 a year. He is denied the right to vote, and is prohibited from taking part in politics.

MEDICINE, RECENT ADVANCES IN.

Malaria and Mosquitoes.—It has been proved that the puncture of a certain species of mosquito, the *Anopheles*, is capable of causing malaria, and it is now believed by many students that this is the only way in which malaria can be contracted. In practical importance the discovery ranks next to Lister's antiseptics, and it will be one of the historical achievements of nineteenth-century medicine. The history of the gradual unraveling of the complicated scheme in which the malaria germ, man, and the mosquito are used for the continuance and spread of the disease is, as Dr. Manson has happily put it, one of the true fairy-tales of science. In order to follow the theory, it is simply necessary to remember that healthy human blood consists of a fluid portion, the blood plasma or liquor sanguinis, and a solid portion made up of two forms of cells, or corpuscles as they are usually called. The red corpuscles are round, disk-shaped, reddish bodies containing the hemoglobin, which gives the blood its color and its efficiency as a sort of vital dumb-waiter for the tissues. The white corpuscles or leucocytes are larger than the red ones, and are spherical.

The complete life cycle of the malaria germ, which is not a bacterium but an animal, belonging to the lowest group of the animal kingdom, the protozoa, forms a closed circle through man and the mosquito, so its life history may be taken up at whatever point is most convenient. Let us assume, then, that we have a man with a well-marked case of malaria—chills, fever, chills, fever, *ad infinitum*. If we examine this man's blood we shall find in a number of the red corpuscles a small, pigmented, jelly-like mass. This is the malaria germ. It grows by eating the substance of the corpuscle, just as a mouse would eat the inside of a cheese. Each germ finally develops into a little patch of protoplasmic mosaic, by dividing its body into minute pieces called spores, and then breaks up, and the pieces wander off in the blood stream. Some of them attack other corpuscles and set themselves up as new mother-germs, which in their turn grow and produce infant *hæmamebidæ* (this is the scientific name of the malaria parasite), and others are eaten by the phagocytes, the scavengers and police of the blood.

But always some of the original germs, although they grow as do the others, by eating the substance of the corpuscles in which they lie, never separate into spores, but remain as simple large homogeneous masses. A hungry mosquito comes along and takes a drink of the man's blood. The result is that she extracts, along with the blood, some of these germs which have not divided, and which have no function as long as they remain in the human body. But as soon as they enter the mosquito's stomach they become active, and undergo a series of changes and combinations quite different from those that occurred in their brothers in the man's body. This finally leads to the production of great numbers of small needle- or spindle-like organisms in the stomach wall of the mosquito. And now comes perhaps

the most remarkable part of the whole scheme. These little germ rods, as they are called, disappear as soon as they are hatched from the sides of the mosquito, and are next found embedded in various nooks and corners in and about the mosquito's proboscis. And when the next time it punctures her next victim some of the needle-like rods escape into his blood. Here they undergo another transformation, and soon afterwards develop into the typical malaria parasite with which we started.

So far as is now known, the only way in which a mosquito can obtain malaria germs is by sucking blood from a malarial sufferer. And the only way a man can contract malaria is through the injection of the germ into his blood by the mosquito. That is to say, not only are both man and the mosquito necessary for the production of malaria, but they must be brought together. The life cycle of the germ is, Man A to mosquito A; mosquito A to man B; man B to mosquito B; mosquito B to man C, and so on.

To trace out and prove this complicated scheme, to locate the germ and convict the carrier of it, has required about twenty-five years of constant work by numerous investigators. The malaria parasite itself was undoubtedly seen more than seventy years ago by Meckel, who in 1830 described certain black particles he had seen in white blood-corpuscles, and also in other amebalike bodies that were not apparently normal constituents of the blood. He had no idea, however, what these bodies were, except that he recognized the pigment as of malarial origin. Some years later his observations were repeated by Frerichs and Virchow, who also failed to recognize the true significance of their discovery.

Early in the autumn of 1880 Laveran, a French army surgeon stationed in Algiers, again came across these pigmented bodies in the blood of a malaria patient which he was examining. He naturally wondered what they were, and whether they had any connection with the malaria from which he knew the man to be suffering, and he determined to study them. He was soon led to suspect that they were living organisms (he saw them move and even grow), and finally was able to prove to his own satisfaction that they were the real parasites that caused malaria. He announced his discovery to the French Academy on Nov. 23, 1880: "J'eus à ce moment même l'intuition que j'étais en présence de véritables microbes du paludisme, et tous les faits que j'ai observés depuis lors n'ont fait que confirmer cette impression première." He observed and described some of the curious changes that the parasite undergoes as it eats out the inside of the red blood-cell in which it lies. He saw the rosette and flagellated bodies, as well as the strange crescents, which we now know play so important a part in the transference of one form of the disease. He saw a medley of things, but they were so strange and apparently unrelated that he was not able to put the various appearances together and prove the unity of the different forms. As Dr. Manson has said: "He had plunged into what was then almost a new zoological kingdom, and it was little wonder that he did not recognize the relationship to each other of the different items, so to speak, that composed the strange fauna. It was as if some intelligent being from the planet Mars, unacquainted with our fauna, had dropped into this world and had come across some such zoological collection as the inhabitants of a fowl-run. He would see fowls, and feathers, and eggs, and empty egg-shells, etc. But he would not be able for a long time to recog-

nize the connection between the egg-shell and the chicken, or between the feathers and the fowl."

One of the striking features of the new germ, and probably the one that led Laveran to his identification of it, was the presence of a peculiar dark-brown pigment, which was known to be a characteristic deposit in certain organs, notably the spleen, of malaria patients, which, as we shall see, the germ always begins to manufacture industriously as soon as it gets into a red blood-cell. In fact, this pigment appears to have been the clue without which the problem would have been almost unsolvable.

Laveran's discovery, for a time considered very doubtful by other pathologists, was gradually confirmed during the next few years, and it marks the first great step in the etiology of the disease. Among other things, it explained the great efficacy of quinine, until then given empirically. Quinine is a deadly poison to certain microbes—among others, to the malaria parasite.

Nine years after Laveran's discovery, Golgi, of Pavia, succeeded in piecing together the different forms that Laveran had described, and worked out the complete phase of the parasite in human blood.

There are several varieties of malaria, and in each of them the germ has a different life cycle; but in general plan they are all much alike, al-

rosette, the red blood-corpuscle, which up to this time has held the parasite together, so to speak, breaks up, and the rosette is liberated into the liquor sanguinis. Here in its turn it goes to pieces, and these little spore-cells float away in the blood stream. The phagocytes immediately eat up the black pigment and many of the spores. A few of the latter escape, however, and succeed in working their way into fresh red blood-cells, where they appear at first as pale specks. If these are watched, they are seen to grow rapidly, until they nearly fill the blood-cell, developing in the meantime their characteristic pigment granules, which finally concentrate at the center as before; the protoplasm separates into spores, and a new rosette body is formed, which eventually breaks up and liberates its spores as did the original parasite. This process is repeated over and over again, each time more of the red blood-cells being destroyed. It has been calculated that about 250,000,000 parasites are necessary to cause a well-marked attack of malaria. When a man has once become infected with the germ the latter, although individually very short-lived, is enabled by this process to continue and increase the infection, unless the blood is disinfected with quinine or the phagocytes get the better of the spores and eat them all up before they have a chance to seek safety in the red blood-cells.

This series of changes has nothing whatever to do with the spread of the disease, and simply serves to continue it in the individual after the parasite has entered his blood.

Golgi worked out these stages for the tertian and quartan forms of the disease; and two other Italians — Marchiafava and Bignami—did the same for the so-called æstivo-autumnal form, which is the most dangerous of the three, and which, because it is commonest in the tropics, is called by Koch "tropical malaria."

The detailed study of these life histories made it possible for the physician, by examining a drop of blood from a patient's finger, to discover immediately not only whether the disease was malaria, but which of the types it would follow. This was a wonderful advance,

and a great achievement for science, but it was only half of the story. It still remained to discover where the germ came from, and how it got into the human body. The old notion had been that malaria was due to bad air, as its name implies. Then some agent in the water or the soil of malarious districts was suspected. Careful search, however, failed to discover the germ anywhere outside of the human body. It could not be found in swamp water, nor in the air over marshy regions, nor in those unhealthy-looking green scums which have such a bad reputation, but which really are quite harmless. There was the germ, however, and as spontaneous generation

GROWTH OF THE MALARIA PARASITE IN THE HUMAN BODY.

A, the quartan parasite; B, the tertian parasite; C, the æstivo-autumnal parasite. No. 1 in each series is the spore. Beginning with No. 2 the red blood-cell is shown, with parasite inside. No. 6 A is the rosette body. Nos. 8 A, 7 B, and 7, 8, and 9 C are the forms which serve to continue the disease when drawn into the stomach of the mosquito, but which have no function as long as they remain in the human body. Nos. 1 to 6 in each group show the complete cycle of the germ in the human body, from spore to spore. (After Ross.)

though the stages differ somewhat in appearance in the several varieties, as shown above. In the quartan form the mature germ is a mass of pale protoplasm which lies inside the red blood-corpuscle, and practically fills it. Scattered through it are the small characteristic pigment masses. Very soon after the parasite has reached maturity these pigment granules concentrate at some point, usually at the center, while the protoplasm separates into little elongated cells, which frequently radiate from the central pigment mass, and give the microbe the appearance of a rosette; hence at this period it is called the rosette, or *rosette* body. Shortly after the formation of the

had long been ruled out, as simply a biological excuse for ignorance, it was evident that it must originate somewhere. It could not be found in the secretions of the breath, or on the skin of the malaria patient, and the only way in which it was possible to transfer it from person to person was by the direct transference of the infected blood; and this, obviously, was extremely rare as a natural occurrence.

ANOPHELES.

Eggs, greatly enlarged.

But there was the evidence all about them; hundreds of people in the tropics were coming down with the disease every day. They hunted, and speculated, and experimented, and got no further, until in 1894 Manson, whose curiosity had been aroused by the apparent *impasse*, and who was studying the germ, noticed that the flagellated bodies, the curious devil-fish form observed by Laveran, were never found in newly drawn

ing the theory. There has also lately turned up a letter giving a similar view, published in 1884 in the *Muktataf*, an Arabic review of Cairo, Egypt. But none of them had been in a position to have the theory thoroughly tested, as was Dr. Manson.

Dr. Manson had observed, some years before, that another parasite of human blood, a microscopic worm called *filaria*, was drawn with the blood into the stomach of a kind of mosquito, and found in that insect a congenial host, in which it soon passed into another stage of its development, and became an entirely different microbe, so far as appearance was concerned. These metamorphoses are quite common among the lower forms of life, some of them passing through three, four, and even five separate stages, in each of which, unless they are actually seen to make the change, they would seem to the observer to be entirely different creatures. Dr. Manson soon became convinced that a similar series of events occurred in the development of the malaria germ, and he fastened on the mosquito as the intermediate host. This was as yet simply theory, however.

Major Ronald Ross, of the Indian medical service, during a visit to England, became deeply impressed with Manson's arguments, and determined to test the theory on returning to India. He was at this time stationed at Secunderabad, and here he began work in April, 1895. He collected mos-

blood, only making their appearance some moments after it was shed—that is, if the blood was killed immediately after it was drawn, and then examined microscopically, none of these bodies ever appeared, whereas if newly shed malarial blood were allowed to stand a quarter of an hour they could always be found. Here was something of obvious importance, it being plain that whatever function these bodies had, it lay outside of the human body. It soon occurred to Manson that their function might be that of spores for spreading the parasite in the external world, and it seemed to him that some suetorial insect was very probably the agent for their diffusion. There had been all sorts of theories regarding the causation of such a wide-spread disease as malaria, and among the theorizers were believers in the mosquito as one of the agencies. Dr. Koch found certain tribes in German East Africa who thought the disease entirely due to mosquito bites. And nearly twenty years ago Dr. A. F. A. King announced his belief in the mosquito theory, as did also Dr. Laveran himself in 1884. Indeed, Dr. King, in a paper read before the Philosophical Society of Washington in 1882, refers to an article by a Dr. Josiah Nott, published in 1848, uphold-

ing the theory. There has also lately turned up a letter giving a similar view, published in 1884 in the *Muktataf*, an Arabic review of Cairo, Egypt. But none of them had been in a position to have the theory thoroughly tested, as was Dr. Manson.

Dr. Manson had observed, some years before, that another parasite of human blood, a microscopic worm called *filaria*, was drawn with the blood into the stomach of a kind of mosquito, and found in that insect a congenial host, in which it soon passed into another stage of its development, and became an entirely different microbe, so far as appearance was concerned. These metamorphoses are quite common among the lower forms of life, some of them passing through three, four, and even five separate stages, in each of which, unless they are actually seen to make the change, they would seem to the observer to be entirely different creatures. Dr. Manson soon became convinced that a similar series of events occurred in the development of the malaria germ, and he fastened on the mosquito as the intermediate host. This was as yet simply theory, however.

Major Ronald Ross, of the Indian medical service, during a visit to England, became deeply impressed with Manson's arguments, and determined to test the theory on returning to India. He was at this time stationed at Secunderabad, and here he began work in April, 1895. He collected mos-

quito larvæ (the mosquito undergoes a series of transformations, similar to those above described, which are shown here) and bred them in

bottles. He caused the mosquitoes thus reared to bite persons affected with malaria, and then dissected the mosquitoes for evidence of the development of the parasite within them. The first result of these experiments apparently disproved the theory, for he failed to obtain a mosquito whose bite would cause the disease. Not only this, but he traced the malaria germ into the mosquito's stomach, and found that it died there. He so thoroughly believed in the guilt of the mosquito, however, that he persevered, varying his experiments in all sorts of ways, and dissecting, in two years, more than 1,000 mosquitoes. Up to this time he had employed only two kinds of mosquito, but one day in August, 1897, a native brought him a bottle of larvae from an unknown source, and when he raised these he found that they produced a new kind of mosquito. He induced the new mosquitoes to bite a malaria patient; and in two of them, when they were dissected, round bodies, possessing the typical malaria pigment, were found in the walls of the stomach, and here at last was the long-sought extra-corporeal phase of the parasite. He watched these bodies, and found that they grew very rapidly, increasing from ten to twelve times in diameter.

At about this time Dr. W. G. MacCullum, of Johns Hopkins University, announced a discovery regarding the development of a somewhat similar protozoal parasite in the pigeon, the importance of which, in connection with the extra-corporeal phase of the malaria germ, Dr. Manson immediately perceived. Dr. MacCullum had found that the arms of the flagellated body of the pigeon parasite were not simply spores, as had been believed, but were really sexual bodies which required for their further development a female cell. Ross was in constant communication with Dr. Manson, and was soon informed of MacCullum's discovery. His work was now unavoidably interrupted, and when he was able to resume it, early in 1898, could not, owing to the plague scare

each wall pigmented bodies exactly similar to those which he had found in his rare species of mosquito, fed on the blood of a man with malaria. These pigmented bodies grew rapidly, and soon formed protrusions, like warts, on the walls of the stomach. When he dissected one of these mature warts he found it full of minute, rod-like bodies, which he called germinal rods. Soon after the warts had filled up with the germinal rods he saw them burst open and scatter the rods into the general body cavity of the mosquito outside of the stomach. For a considerable time, although he watched very closely, he got no further. But one day, in dissecting the head of a mosquito, he came upon the final link in the chain.

One could hardly suggest an investigation that would seem to be more barren of practical utility than the dissection of a mosquito, and yet in the hands of Dr. Ross it led to the final and complete solution of the malaria problem. He found, on dissecting the head, two glands, the ducts from which united and ran to the root of the proboscis. These proved to be the salivary glands, and in and around them he found great numbers of the germinal rods. If these same processes could be demonstrated in the mosquito for the human malaria germ, the mosquito cycle was proved and the etiology of the disease completed.

In a very short time this was done, not only by the Italian students Grassi, Celli, Bignami, and Bastianelli, but also by Dr. Koch, the German pathologist, and the case was completed from the laboratory point of view. It was found that Ross's failure to complete the cycle in man was due to his not having had, except in one instance, above referred to, the proper variety of mosquito to work with. This proved to be the *Anopheles*. The common gray or brindled mosquito which abounds in all mosquito-haunted localities belongs to a group known as *Culex*, which, fortunately, is not hospitable, for some unknown reason, to the malaria germ. That is, the latter will not grow in the stomach of the *Culex* into the spindle-like germinal rods that seem to be necessary for completing the cycle.

This cycle in the *Anopheles* mosquito, as worked out by the Italians for the tropical form of the disease, which is illustrated on pages 346, 347, is as follows: When malaria-infected blood enters the stomach of the mosquito the malaria parasites develop into two different bodies. One is a spherical protoplasmic mass, and the other the flagellated body. These originally were the crescent bodies. The long arms of the flagellated body soon break away from the central mass, and each one finally enters one of the spherical bodies and coils up in it. This combined form soon develops the ability to move about, and eventually forces its way into the substance of the

stomach wall. Here it becomes motionless and begins to grow rapidly, so that in a few days it protrudes from the stomach wall like a wart. At this time it is filled with thousands of the small spindle-like germinal rods. This wart-like excrescence soon ruptures, and discharges its contents of germinal rods into the body cavity outside of the stomach. The rods immediately disappear into the tissues of the mosquito, and are soon found in countless numbers in its salivary glands; and some of them gain entrance into every person the mosquito bites.

THE CHANGES THAT OCCUR IN THE ÆSTIVO-AUTUMNAL PARASITE AFTER IT HAS BEEN DRAWN INTO THE MOSQUITO'S STOMACH.

No. 4 is the flagellated body. No. 5 shows three of the flagella which have broken loose from 4, and one of which is seen entering the female gametocyte in 6. This combined form finally enters the stomach wall of the mosquito, and its growth produces the wart-like appearance shown on page 347. (After Ross.)

in Calcutta, where he was now stationed, secure satisfactory human experimental material. He was very anxious to go on with the work, and so turned his attention to a malaria-like parasite (proteosoma) which had been observed in certain birds. He collected some of the Calcutta sparrows, and found that many of them contained this germ, which lived in the red blood-corpuscles, just as the malaria germ lives in human blood. He pastured a herd of uninfected mosquitoes on some of these infected sparrows, and after a few days dissected the former. He found in the stom-

This was the final proof of the complete cycle through man and the mosquito. But there were still many skeptics, so some infected *Anopheles* were allowed to bite a man in Rome, and he soon developed the malaria parasite in his blood. Still the skeptics were not satisfied—the man might have been infected in some other way, or had a sort of latent infection in his blood all the time. So finally Dr. Manson, wishing to make the proof striking and positive, devised two crucial tests, which were carried out in the summer of 1900, and the results leave the fair-minded skeptic defenseless.

The first of these consisted in sending two physicians—Drs. Sambon and Low—to live in a very malarial district on the Roman Campagna (Ostia) during the most malarious season of the year, their only protection from the disease being mosquito-netting. No quinine or other prophylactic was taken, and they were directed to sleep with the windows and doors open so as to give any bad night air there might be “a chance at them.” This they did, living in a house whose only peculiarity lay in its being mosquito-proof. Here they stayed all summer, and while the whole surrounding population of natives was down with malaria, neither of the unacclimated experimenters ever showed a trace of it. This proved that unacclimated people could live in perfect health in an extremely malarious region, where even the acclimated natives are continual sufferers, by simply avoiding mosquito bites.

For the second experiment some laboratory mosquitoes were reared from the eggs in Rome, pastured on a malarial sufferer there, and then sent alive to London. Here they were permitted to bite a healthy man whose blood had been examined and shown to be free from the malaria germ. Dr. Manson's son volunteered for the service. He was bitten freely by the mosquitoes, and

Much still remains to be done. It is by no means proved that there is no other mode of propagating the disease than by mosquito bites, although it now seems probable that this is true. There is no certainty that other species of the mosquito besides *Anopheles* may not act as transmitters of the germ. The only thing we appear to be fairly certain of is that none of the *Culex*

species do so. There are, however, about 240 known species of mosquito, and it is not at all improbable that some of these may be found to possess the same claim to distinction, and extinction, as the *Anopheles* tribe.

Then the discovery has opened a new field in the fight against malaria by practically changing it into a war of extermination against the mosquito. This is being actively carried on in several portions of Italy, and to some extent also in this country. The mosquito breeds chiefly in small bodies of surface water which contain no fish (fish eat up the eggs and larvæ), and hence especially those about new excavations. One of the prophylactic methods now urged is the filling

in a short time he not only developed, in the heart of London, the clinical symptoms of malaria, but his blood was found to be swarming with the typical parasites.

These two experiments complete the story, and from the purely scientific point of view, as well as from that of the utilitarian, few achievements in modern medicine have equaled it.

up of all such small puddles, and the covering of the surface of the larger ones with kerosene oil, which prevents the larva from getting air, and hence smothers it. These two methods, with the careful use of mosquito-netting, are the means at present believed to be the best preventives of malaria. Persons finding it necessary to go into regions having a bad reputation for malaria

should be careful to avoid all mosquito bites, and especially those of the species *Anopheles* (page 345). These may be distinguished from the other common species, *Culex*, by the difference in their palpi, as is shown on this page. In *Culex* these are short and club-like; in *Anopheles* they are almost as long as the proboscis, and slender. The male mosquito does not bite human beings.

CULEX TENIORHYNCHUS (FEMALE) SHOWING THE SHORT PALPI THAT DISTINGUISH CULEX FROM ANOPHELES.

In New York city and the surrounding districts, Dr. William N. Berkeley says, the *Anopheles* may be readily distinguished by its spotted wings. The avoidance of *Anopheles* bites may be secured by keeping indoors at night, as this species appears to be largely nocturnal in its feeding habits. This, of course, implies that the house occupied has been made thoroughly mosquito-proof.

One of the results of the new theory promises to be the careful isolation from mosquitoes of malarial sufferers, as each mosquito biting a man with malaria immediately becomes a new source for the spread of the disease.

The mosquito, while not so prolific as the malaria parasite, is still rather a rapid breeder. Prof. L. O. Howard calculated that the 19,110 larvæ that he found in a rain barrel would, by the end of the summer, have produced a number of mosquitoes expressed by not less than 25 figures.

The economic importance of the final solution of the malaria problem will be appreciated when it is remembered that 5,000,000 persons die every year in India of fevers, a large number of which are malarial in origin, and that in certain portions of Africa and India the country is practically uninhabitable because of this disease.

Mosquitoes and Yellow Fever.

—According to Dr. Walter Reed, of the United States army, director of the recent Yellow Fever Commission in Cuba, the theory that some insect, and not a diffusible miasm, as was generally believed until recent years, is the active agent in the spread of yellow fever, was first advanced by Dr. J. C. Nott, of Mobile, Ala., in March, 1848. His views are given in full in the New Orleans Medical Journal for that year. In the same article Dr. Nott ex-

pressed his belief in the mosquito theory of malaria. The credit for the explicit statement of the theory of the propagation of yellow fever by mosquitoes belongs to Dr. Carlos J. Finlay, of Havana. He announced his theory in a paper read before the Royal Academy of that city on Aug. 14, 1881. Dr. Finlay's theory was not generally accepted at that time, and he seems not to have been in a position to test it adequately, although he has continued to work on the problem up to the present time. That the mosquito is capable of causing yellow fever has now been proved beyond a doubt by the experimental work of the commission that the United States Government sent to Cuba to study the disease in June, 1900. During the interval between Dr. Finlay's announcement of his theory and the final proof of the mosquito's guilt by Dr. Reed's work, the attention of investigators appears to have been directed chiefly to finding the actual yellow-fever germ itself. Sternberg and Sanarelli thought they had isolated the true yellow-fever germ in the so-called *Bacillus icteroides*. But the later researches of Dr. Reed and his colleagues have failed to confirm this, and at present, although there is no question that a certain species of mosquito, *Stegomyia fasciata* (formerly *Culex fasciatus*), can carry the infection of yellow fever from person to person, what this infection consists of has not been satisfactorily determined. The recent work of the Yellow Fever Commission in Cuba, while not so complete as that which led to the solution of the malaria problem, is of great economic as well as scientific importance. Dr. Hurlbeck, of the American Public Health Association, estimated that the epidemic of yellow fever of 1897 in Louisiana, Mississippi, and Alabama, which cost nearly 16,000 lives, involved a total loss to the country of not less than \$100,000,000.

As no yellow-fever germ has yet been isolated, it is not possible to construct a complete cycle, as was done in the case of malaria; but by actual experimental infection with infected mosquitoes of some brave volunteers from the United States army, who gave themselves freely for the dangerous work, the guilt of the mosquito has been positively proved. Camp Lazear, where the commission's experiments were carried on, was about a mile from Quemados, Cuba. Three sets of tests were carried out. First, the attempt was made to infect non-immune individuals by exposure to intimate contact with infected clothing and bed-

1, male; 2, female.

ding, by what are technically known as fomites; second, by the direct injection of blood from cases of yellow fever; and third, by the bites of mosquitoes that had been pastured on yellow-fever

sufferers. The equipment of the camp included two frame buildings, one of which, known as the "infected-mosquito building," was divided near its middle by a permanent wire-screen partition, and had good ventilation. The other, known as the "infected-clothing building," was purposely so constructed as to exclude anything like efficient ventilation. Both houses were provided with wire-screen windows and double wire-screen doors, so that mosquitoes could be kept without or within the buildings.

The first mosquito infection was obtained on Dec. 8. One of the volunteers, Kissinger by name, had been bitten by five mosquitoes which had previously been allowed to bite a yellow-fever patient. On Dec. 8 he came down with a well-marked case of yellow fever. He had been under strict quarantine for fifteen days, so that the possibility of any other source of infection was removed. Within the period of one week from Dec. 9 to Dec. 15, 4 of the volunteers who had allowed themselves to be bitten by infected mosquitoes developed well-marked cases of yellow fever. And of the 14 non-immune individuals subjected to the bites of infected mosquitoes during the whole test, 10 contracted yellow fever, the attack always following the bites within the period of incubation of the disease. Of 5 individuals who received direct injections of blood from yellow-fever patients, 4 contracted the disease. On the other hand, 7 non-immune Americans who slept every night in the "infected-clothing building," poorly ventilated, and to which no sunlight ever came, engaged in the morning in packing boxes with garments much soiled by contact with the bodies and excreta of yellow-fever patients, and at night unpacking these same boxes in order to obtain articles for their beds, and clothing for their bodies. Sleeping in the very beds and garments just vacated by yellow-fever cases, these 7 men came out of this pest-house at the end of the experiment perfectly well, not one of them having contracted the disease. The "infected-mosquito building," divided into two compartments by a wire-screen partition, was next used as follows: Fifteen mosquitoes were freed on one side of the partition, and a non-immune man, Moran, was placed in the room. On the other side of the partition, protected from the mosquitoes, were 2 other non-immunes. Moran was bitten freely by the mosquitoes, and soon developed a sharp attack of yellow fever, while the 2 non-immunes on the other side of the screen remained perfectly well. The next experiment was on one of the non-immunes who had occupied the "infected-clothing building" for twenty-one nights, and had then been kept in strict quarantine thirty days longer. He visited the mosquito room, was freely bitten, and in three days and twenty-three and a half hours developed a well-marked case of yellow fever.

These experiments appear to leave no possible doubt regarding the ability of the mosquito to cause yellow fever, and also point strongly to the absence of any infection due to simple contact with yellow-fever patients or their excreta or clothing. If this be true, the elaborate system of quarantine now in vogue against the disease, and the severe disinfection practised with yellow-fever patients and their belongings, are quite unnecessary. Dr. A. H. Doty, health-officer of the port of New York, says: "Dr. Reed's experiments have not conclusively shown that there may not be some other means than the mosquito by which yellow fever is transmitted. But when the experiments are considered in connection with the results of our practical experience, it is clearly

evident that the disease is not contracted by personal contagion or through the medium of clothing, bedding, cargoes of vessels, etc. Therefore I believe we are justified in changing our quarantine regulations to conform to these views, and that such a proceeding is safe and reasonable, particularly as we now have at hand a method which if properly and scientifically carried out can be depended upon to limit the extension of yellow fever. If the future shows that there are other means of infection, it will then be time enough to add whatever restrictions are necessary for the protection of the public health. I am convinced in following this action we are not only offering full protection to the public, but are extending to commerce a relief from unnecessary and unreasonable regulations."

The identification of *Stegomyia fasciata*—the yellow-fever mosquito—is not difficult. Its most conspicuous markings are a broad semilunar silvery stripe, which is seen on the lateral surface of the thorax, and the white stripes at the bases of the tarsal joints. The four stripes of silvery scales that are seen on the posterior surface of the thorax serve to distinguish the species from all other mosquitoes except *Stegomyia signifer*, in which, according to Prof. L. O. Howard, the curved thoracic band is very narrow and of a somewhat different shape. When examined with a lens, the four stripes are seen to consist of two lateral distinct silver lines—the combination of the semilunar broad stripes—and two fine white lines between these. The insect must be held in the proper light, in order that these delicate threads may be distinctly seen. The lateral surface of the thorax is also marked by several silvery dots, and the abdomen by distinct white stripes. In the female the palpi are short, as in the genus *Culex*. The species is found all over Cuba, and has been reported from several European countries and from points in Central and South America. In the United States, according to Prof. Howard, it has been found at New Orleans, in eastern Texas, at Hot Springs, Ark., at Pelham, Ga., and near Norfolk, Va.

The methods recommended for the destruction of this mosquito, which breeds in small bodies of stagnant water, as does the malaria-bearing mosquito, are similar to those used against the latter. According to Dr. Reed's observations, this mosquito will not bite when the air temperature is below 62° F. He also says that an interval of not less than twelve days is necessary after the infection of the mosquito before its bite is capable of causing yellow fever.

The problem of preventing a yellow-fever epidemic when a case is imported into a city resolves itself into two simple factors: First, to prevent any mosquitoes from gaining access to the patient; and second, destroying all that may have previously bitten him. The danger of the importation of infected mosquitoes in baggage and freight is very slight, as the mosquito, when deprived of water, perishes in a few days—five days, according to Dr. Reed's observations.

For destroying mosquitoes that may have already become infected, pyrethrum powder or sulfur is said to be effective. The former, in the proportion of 4 ounces to 1,000 cubic feet of air, will stupefy all the mosquitoes in a tightly-closed room in one hour. They fall to the floor, and may be swept up and burned. Sulfur burned, in the proportion of one pound to 1,000 cubic feet of air, effectively destroys all mosquitoes in a closed room. The result of the application of these discoveries to the city of Havana, in 1901, caused a reduction in the mortality from yellow

fever to less than one-quarter of that of the epidemic year of 1900.

The Light Treatment.—Phototherapy, although by no means a new idea, has only recently come to have a recognized standing in medicine as a legitimate therapeutic agent. It has long been known by physicians that plenty of sunlight is beneficial in some diseases and harmful in others, but until Prof. Finsen, of Copenhagen, published his first paper on phototherapy, in 1893, little use was made of these facts. In smallpox the eruption normally passes into a suppurative stage, and it is as a result of these ulcers that the hideous scars on face and hands remain. Finsen's idea was that, as this scarring is always most pronounced on the face and hands, it is in a measure due to the irritant action of light; and especially to the ultra-violet portion of the spectrum, which contains the chemically active rays. He suggested that smallpox patients should be kept in rooms from which these rays were excluded by the use of red glass and red curtains. The treatment met with considerable success; in many cases the eruption was much modified and little or no scarring resulted. He next turned his attention to the curative action of light as a direct irritant. He found that animals that normally live in the dark are much irritated by exposure to the chemical rays of sunlight, and not at all by the other portions of the spectrum. It had already been shown by several investigators that these chemical rays have considerable germicidal power, and it now occurred to Finsen that they might be of value in treating bacterial diseases of the skin.

One of the most incurable of these is lupus (tuberculosis of the skin), and he went to work at it on this theory. As lupus is especially a disease of the face, it was obvious that ordinary sunlight is not powerful enough to kill the germs, so he tried the effect of concentrating the light by means of lenses, and cutting out the less active portion of the rays with blue glasses. He used an apparatus that made the light about fifteen times stronger than ordinary unconcentrated sunshine, and subsequently found that he could obtain rays of similar intensity by using a powerful arc light (30,000 to 35,000 candle-power). He soon discovered, in working with these concentrated rays, that the blood flowing through the tissues exercised a marked effect in preventing their penetration beneath the surface. While it required fully five minutes to blacken a piece of photographic paper placed behind the ear, if the ear was first compressed so that the blood was squeezed out of it the paper was blackened in twenty seconds, the absence of the red coloring matter of the blood permitting the rays to penetrate almost instantly.

Finsen's apparatus for treatment of lupus by the sun's rays consists of a hollow plano-convex lens filled with an ammoniacal solution of copper sulfate (for cutting out the red rays). The lens is so mounted that it can be turned at various angles. It is used for concentrating the sun's rays on a part in connection with a compression apparatus, consisting of two plates of rock crystal fixed in a metal ring. Through this, which is pressed against the skin, is passed a current of cold water, further to decrease the circulation in the part. The compression disk is held against the skin by the nurse. Only a small area, about the size of a ten-cent piece, is treated at each sitting. Each treatment lasts one hour. Prof. Finsen has also devised an electric-light apparatus. A large arc-lamp is arranged in a sort of hood from which radiate 4 long cylinders, like tele-

scopes. These tubes concentrate the light, and the lower portion is arranged so that a current of cold water can be continuously passed through them, to absorb the heat rays. The compression disk is placed, as in the sun apparatus, at the focus of the light. Rock-crystal lenses are used in the telescopes, as ordinary crown glass cuts off a considerable portion of the chemical rays. The immediate effect of the light treatment is simply a slight redness of the skin. In the course of seven or eight hours this redness increases, and some swelling and slight blistering occur. The application of the light is continued until all the diseased area has been treated, sometimes requiring many months. It is hence very expensive. The cost of running one lamp a year at the London Hospital, Whitechapel, is \$2,000. The results in treating ordinary lupus (*lupus vulgaris*) are excellent. More than 500 cases have been treated at Finsen's light institute in Copenhagen, many of them with excellent and lasting results. Dr. Malcolm Morris, of St. Mary's Hospital, London, considers it "the best remedy for lupus that has yet been found." The obvious advantages of the method are its painlessness and its lack of actual destruction of tissue, as in operations. It also is said to produce wonderfully good cosmetic results, a hideously scarred and ugly skin frequently being transformed into a soft, supple, healthy tissue which can hardly be distinguished from the surrounding healthy skin.

Several cases of superficial cancer have been reported as much benefited by the Finsen treatment.

At the recent meeting of the British Medical Association the method was discussed in considerable detail. Dr. Sequeira, of the London Hospital, Whitechapel, who is in charge of the largest installation of the light plant used for therapeutic purposes in Great Britain, where 60 or 70 patients are treated every day, expressed his strong belief in the great value of the treatment. He also reported good results in a case of leprosy treated by it. Dr. Malcolm Morris gave the following statistics resulting from eighteen months' use of it. Sixty cases were treated—36 lupus vulgaris, 6 lupus erythematosus, 14 rodent ulcer, 2 alopecia areata, 1 keloid, and 1 epithelioma. Eight of the lupus patients were cured, in 9 the treatment had been abandoned, and the remainder were still receiving it. Seven of the rodent-ulcer cases were cured. Regarding the keloid and epithelioma cases, nothing definite could yet be said. Dr. Morris also said that the remedial action of the light was directly proportional to the reaction caused by it—that is, the more irritation and inflammation it causes, the more effective it is. He had also found that brunettes are not as good subjects as blonds, and the darker their skin the less amenable they are to the treatment.

Drs. Noiré and Sabourand, of Paris, reported cases of skin-disease successfully treated by Finsen's method at the St. Louis Hospital. A modification of Finsen's apparatus, devised by Drs. Lortel and Genoud, of Lyons, was described at this meeting. It treats an area $1\frac{1}{2}$ inch in diameter at each sitting, and requires only fifteen-minute applications, instead of sixty minutes.

The X-rays have also been used to a considerable extent in the treatment of skin-diseases, in many cases with considerable success. But the Finsen method is said to be much more effective, and the X-rays are now recommended by Dr. Morris chiefly for use in situations where the Finsen light can not be applied—in the interior of the mouth and nose, for instance. Although the light treatment is still in an early experimental stage,

it is very probable that a new therapeutic agent of considerable value has been discovered.

Antitoxins and Serum Therapy.—It was recognized early in the history of medicine that certain diseases occur only once in the same individual—that is, that the effect of the disease on the system in some way protects it from subsequent attacks. When it was found that a mild attack of smallpox could be induced by inoculating the contents of a pustule into a healthy subject, and that this mild attack conferred immunity just as effectively as when the disease was contracted in the ordinary way, the antitoxin treatment was inaugurated. This method of treating smallpox was introduced into England by Lady Mary Wortley Montagu in 1721; but it is probable that it was used by the Indians and the Chinese hundreds of years before. Many dangers were connected with the direct transference from person to person of the infective material. The smallpox patient might be suffering from syphilis, for instance, and this disease might be inoculated along with the smallpox. Again, the result of inoculation was to produce an attack of true smallpox, which was infectious, and could be transferred to other individuals by ordinary infection, and cause dangerous attacks. So the method met with considerable opposition. In 1798 Jenner published his account of the protective action of cowpox. This proved to have all the advantages of the direct inoculation, and none of the latter's dangers, and its wide-spread use has practically stamped out smallpox. The theory of the action of the cowpox vaccine is that cowpox is a disease caused by the entrance into the cow of a specific infection, and that its passage through the latter animal, which is little susceptible to the disease, weakens its virulence, or attenuates it to such an extent that it is not dangerous to man, although its inoculation into his system gives him all the immunity against true smallpox that a severe attack of the disease confers. It has been discovered that other human disease germs may be diminished in virulence by this same method of passing them through animals that are only slightly susceptible to the disease. Several other methods of lessening the virulence of disease germs have been discovered recently. If they are exposed to temperatures above that at which they grow best, or to direct sunlight, or to the electric current, or to the action of chemicals such as carbolic acid, it is found that their virulence is much diminished. Anthrax vaccine is obtained by growing cultures of the germs, obtained from cases of the disease, at somewhat higher temperatures than their normal, and using these for inoculating patients, in doses of gradually increasing virulence. Still another method of decreasing bacterial virulence is by drying. This is the device used by Pasteur for making his rabies vaccine. He found that for each day of drying the brain of a mad dog, which if injected when fresh into the brain of another dog produces hydrophobia, it lost a certain amount of its virulence; and that after fourteen days it had entirely lost the power of producing the disease. In treating a case of "mad-dog" bite, unless it is very urgent, the first injection is made with a well-dried or weak virus; each subsequent injection is a little more virulent, until finally the full strength is inoculated and the individual has become immune to hydrophobia.

In still other cases the products of the growth of microorganisms or extracts of the dead germs themselves can be used to secure artificial immunity in man. Koch's tuberculin belongs to the latter class, as does also Haffkine's antiplague serum.

Another, and perhaps the most successful of all the antitoxin methods (with the exception of Jenner's vaccine), is that used in the treatment of diphtheria. Emil Behring, in 1890, discovered that the blood and serum of animals that had been rendered artificially immune to diphtheria by graduated injections of the germ possessed pronounced antitoxic properties when injected into human beings. The subsequent investigations of Ehrlich, Roux, and others have standardized this antitoxin, which is now commonly made by immunizing horses and using their serum. The use of this serum has very markedly reduced the mortality from diphtheria, and it is now the routine treatment for the disease.

The two antitoxins that have received the most attention recently are those used against typhoid fever and plague. The method of obtaining the antityphoid serum used by Dr. A. E. Wright, of Netley, is as follows: A virulent mass of typhoid germs is allowed to grow at about 37° C. for two weeks, and is then heated at 60° C. until the germs are killed. A small quantity of lysol, an antiseptic, is now added. The resulting fluid contains the poisons produced by the growth of the bacteria, as well as the portions of the latter's bodies which are soluble. The injection of 5 cubic centimeters of this fluid will kill a small guinea-pig in less than twenty hours. The amount used for injection into human beings is two-fifths of that necessary to kill a guinea-pig weighing 250 grams. A second dose of double the quantity may be given in a week. The effects produced by the injection of this antitoxin are fever (up to 102° or 103°), severe headache, loss of appetite, and in some cases vomiting. The reaction subsides in three or four days. There is still considerable difference of opinion among students as to the value of this serum. Dr. A. E. Wright, who has experimented extensively with it, gives the following statistics. In 1900, of 11,295 individuals under observation in India, one-fourth were inoculated. Of the inoculated, 0.95 per cent. contracted the disease, and a mortality of 0.2 per cent. resulted. Of the uninoculated 2.5 per cent. had the disease, with a death-rate of 0.34 per cent. In the British army in Bengal, for the period of Oct. 22, 1899, to Oct. 22, 1900, of the inoculated 0.55 per cent. had the fever, with a mortality of 0.27 per cent.; of the uninoculated, 6.14 per cent. took the disease, and 3.35 per cent. of these died. Among the British troops in Egypt and Cyprus in 1900, of the inoculated 0.14 per cent. had typhoid, with a mortality of 0.14 per cent.; of the uninoculated, 2.5 per cent. had the disease, and 0.4 per cent. of these died. During an epidemic of typhoid at a large insane asylum in Dublin, Ireland, 511 persons were inoculated and 114 not inoculated. In the inoculated, 7 cases developed; in the uninoculated, 29. There are several plague sera—Haffkine's Yersin's, Roux's, Lustig and Galleoti's, and Calmette's. Of these Haffkine's and Calmette's have been the most extensively tested. Haffkine's serum is obtained by simply killing cultures of the plague bacillus (*Bacillus pestis*) by continued heating at 70° C., and using the resulting fluid for injection into man. Considerable success has attended the use of this serum in India. Dr. Calmette, of the Pasteur Institute in Paris, obtains his antitoxin by first establishing immunity in the horse, as is done in the case of the diphtheria antitoxin, and then using the latter's serum for human injection. He gives very favorable statistics.

Dr. Calmette has also devised a snake-bite antitoxin, which he calls antivenine. It has proved valuable when used immediately after the occur-

rence of the bite. Dr. Calmette was himself recently bitten by one of the poisonous snakes in his laboratory, and probably saved his life by the immediate use of antivenine, although he ultimately lost the finger that was bitten, through gangrene.

Among other sera that have been tried, but as yet not sufficiently to furnish very definite information regarding their value, are an antistreptococcal serum which has been used in the treatment of pernicious anemia, in septicemia (blood-poisoning), and in puerperal fever, and an antitetanic serum used in tetanus (lockjaw).

The Differentiation of Human and Other Mammalian Blood.—In the *Deutsche Medizinische Wochenschrift* of Feb. 7, 1901, Dr. Uhlenhuth describes a method of distinguishing between the blood of man and the common warm-blooded animals. The possibility of a reliable test of this sort is of the utmost medico-legal importance. The method is described by Dr. Uhlenhuth as follows: At intervals of six to eight days about ten cubic centimeters of defibrinated human blood are injected into the abdominal cavity of a rabbit. After five such injections the blood-serum of the rabbit is fit for use. Samples of the blood of different animals are diluted with about 100 times as much ordinary water, making pale-red solutions of an equal depth of color, which are then filtered. Two cubic centimeters from each of these solutions are placed in separate test-tubes, and each mixed with 2 cubic centimeters of a solution of common salt, of a strength of 1.6 per cent. It is essential to use this particular salt solution, for the normal serum of the rabbit mixed with plain water gives rise to a turbidity that may interfere with the test. Dr. Uhlenhuth employed in his experiments the blood of man, the ox, horse, ass, pig, sheep, dog, cat, stag, fallow deer, hare, guinea-pig, rat, mouse, rabbit, common fowl, goose, turkey-cock, and pigeon. To each of the prepared test-tubes are now added 6 or 8 drops of the serum of the rabbit that has been injected with human blood. In the test-tube containing the solution made with human blood appears a distinct turbidity, which finally leads to the deposit of a copious flocculent precipitate; while the contents of the tubes containing solutions of the blood of the other animals remain perfectly clear. The reaction is very delicate, only traces of blood being required. Dr. Uhlenhuth succeeded in recognizing specimens of human blood that had been allowed to dry on a board for four weeks. His experiments were carried on at the Hygienic Institute of the University of Greifswald.

Spinal Anesthesia.—Leonard Corning, an American physician, is said to have first suggested the direct injection of drugs into the spinal canal, for the production of local anesthesia without affecting the brain. Bier, in 1899, first tried the method in actual practise, and it has since been used extensively, especially on the Continent. The method of procedure is described by Tuffier, of Paris, as follows: An ordinary hypodermic syringe is used, with a long needle. The patient is seated and bent slightly forward. The needle is now carefully inserted just above or below the spinous process of the fourth lumbar vertebra. As soon as it enters the medullary canal the clear, yellowish cerebro-spinal fluid begins to escape drop by drop. The hypodermic syringe is now screwed to the needle, and from 15 to 30 drops of a dilute solution of one of the local anesthetics—cocaine, eucaine, or tropacocaine—are slowly injected. The needle is then withdrawn, and the small puncture is closed with collodion. The anesthesia passes gradually upward

from the feet to a height corresponding to the distribution of the highest affected spinal nerves.

The subject of spinal anesthesia is still in an unsettled condition, some observers praising it highly and others finding it dangerous and inefficient. Tuffier has performed more than 200 operations under it, and thinks it very valuable. Baker, of University College, London, also speaks highly of its value. Bier, who has used it considerably, does not encourage its general adoption. Delbet concludes that it offers no advantages over chloroform. Some surgeons prefer cocaine, others eucaine, and Dr. Schwarz has found that tropacocaine, in doses of 0.015 gram to 0.050 gram, gives the best results.

The method has been used in many cases where a general anesthetic was contraindicated, owing to heart or kidney disease, and its chief field of usefulness will probably be found in such cases. An attempt has also recently been made to produce neuro-regional anesthesia by injecting cocaine into the large nerve trunks.

Cancer.—The present methods of treating cancer may be roughly divided as follow: operation, drugs, bacteriatherapy, organotherapy, phototherapy, antitoxins, and electricity. In bacteriatherapy (Coley's method) another germ, or germ toxin, is injected into the cancer, on the theory that it will act as a poison to the cancer microbe. In organotherapy (Beatson's method), certain glands are removed, or the secretions of others are supplied to the body, on the theory that cancer is due to some perversion of glandular function.

By far the best results in the treatment of cancer are obtained through early and extensive operation. It is of the utmost importance that the extirpation be done as early as possible. For this reason every abnormal growth in the shape of a suspicious lump or "sore" should be immediately examined by a physician, and, if there is any doubt regarding its benignity, instantly cut out. There is no doubt that thousands of persons die horrible deaths every year who might have been saved for many years of usefulness if the surgeon had been called in early enough. The other methods of treating cancer are usually only adopted as a last resort, in cases upon which, either owing to the large extent of the disease or its inoperable situation, the surgeon is helpless, or else when the patient absolutely refuses operation.

The local application of caustic drugs is the regulation method of the numerous advertisers of cancer cures "without use of the knife." It is sometimes successful in the superficial forms of the disease. The injection of various irritating substances has also been tried, among them oil of turpentine, arsenious acid, acetic acid, alcohol, methyl violet, the venom of the cobra-dicapello, and *Chelidonium majus* (celandine). The latter drug, which is sometimes given internally, is much used in Asia and the East Indies for the treatment of warts and tumors; and according to Dr. William B. Coley, of the New York Cancer Hospital, it undoubtedly has some influence on cancerous growths. The internal administration of drugs has met with little success.

Dr. George T. Beatson, of the Glasgow Cancer Hospital, is the originator of a method of treatment that has met with some success, especially in cancer of the breast. It consists of the removal of the ovaries by operation, and the subsequent administration, in some cases, of extract of thyroid gland. Stanley Boyd reports success in 35 per cent. of the cases so treated. Dr. Robert Abbe, surgeon to St. Luke's Hospital, New York

city, has also had considerable success with it, and has recently reported two remarkable cures.

Dr. William B. Coley, surgeon to the New York Cancer Hospital, experimented in 1892 with injections into cancer of the mixed poisons resulting from the growth of the streptococcus of erysipelas and the *Bacillus prodigiosus*. Although the treatment is somewhat dangerous, Dr. Coley's statistics show that about 12 per cent. of the cases are fairly successful, and its trial is certainly warranted when other means have failed. Regarding the use of the cancer sera, or antitoxins, statistics collected by R. Eschweiler, of Bonn, indicate that they have little if any value. The effect of the passage of an electric current through the diseased tissue has also been tried, but with little success. An electrolytic method, using a mercury-coated electrode introduced into the substance of the cancer, is believed by Dr. Coley to warrant further trial. The X-rays and Finsen's light apparatus have been tried somewhat extensively in the last year or two. The latter has proved very valuable in a variety of cancerous growth known as rodent ulcer, and Dr. Malcolm Morris, of St. Mary's Hospital, London, has reported positive cures. Other investigators have also announced some success with it, although it has not been so successful in other varieties of cancer.

The X-rays have seemed to possess a curative action in some cases. Dr. Carl Beck, at a recent meeting of the German Medical Society of New York, showed a case of melano-sarcoma, one of the most malignant forms of the disease, which had been markedly improved by X-ray treatment.

The cause of cancer is still an unsettled question, physicians and pathologists differing radically regarding its origin. There are four general theories—the embryonal of Cohnheim, which supposes the affected tissue to have either contained an isolated portion of embryonal tissue which suddenly becomes active, begins to grow, and forms the cancer, or through some change in condition, the tissue itself suddenly assumes embryonal qualities. The parasitic theory attributes it to a specific germ, a cancer bacterium. The dietetic ascribes it to high living; and the irritation theory supposes it to be due to long-continued irritation, as from constantly holding a clay pipe in the mouth, or from bruises or abrasions. Of these, the embryonal and the parasitic have the most supporters.

Several physicians—among them Dr. Roswell Park, of the New York State Pathological Laboratory at Buffalo, Dr. H. G. Plimmer, of St. Mary's Hospital, London, several investigators on the Continent—Sanfelice, of Cagliari, Roncali, of Rome, and Durante—have isolated organisms from cancer-cells which they believe to be the true cause of cancer. In the English Practitioner for April, 1899, Dr. Plimmer published several plates showing these cancer germs. Dr. Park says of the work at the Pathological Institute in Buffalo: "In virtually every case of cancer yet examined, where we have had access to the fresh specimen, it has been possible to find bodies which can not be other than parasites, . . . and they can now be demonstrated to any one at the laboratory." In an address before the American Medical Association at St. Paul, June 5, 1901, he said they had been able to cause cancer in animals by inoculating them with cancerous material from the human subject. He also called attention to the fact that independent investigations by Pfeiffer, Sawtschenko, Sjöbring, Eisen, and Max Schüller have corroborated in detail the results attained at the Buffalo Institute.

Regarding the increase of cancer, which considerable has recently been reported, also much difference of opinion among physicians. The majority, perhaps, believe that there has been a considerable increase in its prevalence.

Dr. William Whitney, at the recent annual meeting of the Massachusetts Medical Society, quoted statistics from large hospitals, insane asylums, etc., which indicated that there has not been an increase. Notnagel found, from a study of the statistics at the K. K. Allgemeines Krankenhaus, Vienna, that there had been no appreciable increase in its prevalence.

It is contended by some physicians that the large and apparently continued increase which most statistics appear to show is due simply to improved methods of diagnosis, which now correctly label as cancer many cases which a few years ago would have escaped detection.

One of the recent and novel theories to account for cancer—interesting probably chiefly because of its novelty—is put forward by Dr. John Holden Webb, of Melbourne. He believes cancer to be due to the precipitation from solution of cholesterol, a wax-like constituent of bile. This is normally held in solution by a natural soap. When for any reason this soap is not present, cholesterol is deposited and a cancer-cell formation is started. So Dr. Webb's remedy for cancer is soap solution, subcutaneously injected. He claims to have successfully treated cancer in this way.

Another novel suggestion has been made recently by F. Loeffler. He calls attention to observations by the older clinicians showing that the supervention of a malarial infection can cause the disappearance of cancerous growths, points out that the disease is rare in the tropics where malaria abounds, and urges experimental work with injections of the malarial organism.

Bovine and Human Tuberculosis.—The announcement by Dr. Robert Koch at the tuberculosis congress held in London in the past summer that bovine and human tuberculosis were two different diseases, and that the human disease could not be produced in cattle, was not by any means a novel theory, several other students having previously announced a similar view. But the fact that Dr. Koch himself was the discoverer of the tubercle bacillus, and that his researches had been chiefly instrumental in building up the elaborate precautions now in force against tuberculous cattle, and their meat and milk, gave his statements an unusual interest. The experiments on which he based his views were briefly as follow: Six young cattle were fed with tubercular sputum almost daily for seven or eight months; four repeatedly inhaled great quantities of bacilli that were distributed in water and scattered with it in the form of spray. In other cases, the tubercle bacilli or the sputum was injected under the skin or into the abdominal cavity. None of these cattle (there were nineteen) showed any symptoms of the disease, and they gained considerably in weight. From six to eight months after the beginning of the experiment they were killed, and not a trace of tuberculosis was found in their internal organs. When these same experiments were repeated with tubercle bacilli from tuberculous cattle, the animals invariably became tuberculous.

As has since been pointed out by several writers, even if cattle are immune to human tuberculosis, man might be susceptible to the bovine form of bacillus, and, as Dr. Koch himself said, the direct experimental test of this question, involving as it would the deliberate infection of human beings, is at present impossible.

In a subsequent address at the same congress Dr. John McFadyean, principal of the Royal Veterinary College, London, questioned Dr. Koch's conclusions, giving his opinion that "there still remain reasonable grounds for regarding tuberculous cow's milk as distinctly dangerous to human beings." He pointed out the fact that the bacilli from the two diseases are indistinguishable, and said that he and other experimenters had repeatedly succeeded in causing undoubted tubercular lesions in cattle by the injection of human tubercle bacilli. In conclusion he said: "I earnestly hope that the congress will not in-dorse the view that it is inadvisable to take any measures to prevent the transmission of tuberculosis from the lower animals to human beings. To justify the introduction of measures to that end, it is not necessary to contend that this is a common method of infection, or that the danger arising from milk can for a moment be compared with that present in human sputum. The inhalation of tubercle bacilli expelled from the bodies of human patients is doubtless the great cause of human tuberculosis, and every practicable means of preventing infection in that way ought to be employed. But at the same time we ought not to concede to the milkmen the right to sell us tubercle bacilli, even if we are assured that, like Prof. Koch's experimental pigs, we have nothing to fear beyond the development of 'little nodules here and there in the lymphatic glands' of our neck, and 'a few gray tubercles' in our lungs."

Other pathologists, among them Lord Lister and Profs. Bang, Nocard, and Sims Woodhead, refused to accept Dr. Koch's statements as conclusive, and while they admit that the danger from tuberculous milk and meat may have been much overrated, they strongly deprecate any relaxation of the present laws against tuberculous cattle and their products.

A royal commission was appointed by the British Government, soon after the congress, to determine the exact relation between the two diseases.

Rats and the Plague.—It had long been suspected, owing to the fact that a rat plague was almost invariably observed to precede and accompany human epidemics, that there was some connection between rats and human plague. So that when, in 1894, Yersin and Kitasato isolated the plague bacillus (*Bacillus pestis*), and it was subsequently found in rats, the identity of the two diseases was accepted with little question. These and other investigators worked out the relationship between the two diseases, and a series of sanitary regulations are now in force at many seaports liable to plague infection which have for their chief purpose the destruction of infected rats. The local government board of London issued, in the past summer, a series of recommendations to the British port authorities for prevention of the plague, which consisted almost entirely of directions for destroying infected rats. In the London Lancet for Aug. 3, 1901, Dr. Alexander Edington, director of the Bacteriological Institute of Cape Colony, published an article in which he described experiments made during an epidemic of plague in Cape Town which at any rate suggest the possibility that rat plague and human plague are not the same disease, and are due to different bacilli. His researches, however, were not extensive, and do not justify any change in present preventive measures.

METALLURGY. Structure of Metals.—Much attention has been paid of late years to the study of the structure of metals as affecting their

qualities in use, and in this great aid has been afforded by micrographical examination.

A research concerning which a first paper was read before the Iron and Steel Institute has been carried on for six years by Prof. J. O. Arnold, for the purpose of elucidating the cause of the extraordinary discrepancies which are met with in the practical working of two steels, perhaps of identical composition, contradicting what might have been anticipated from the results of previous experiments. A series of specimens of metal containing iron and from 0.06 to 1.95 per cent. of carbon, and practically free from silicon, manganese, sulfur, and phosphorus, were experimented upon to ascertain the various effects produced by the usual forms of heat and mechanical treatment to which metals are liable to be subjected. Seventeen types of metal were experimented upon, each of which was cast in a composite mold with a central head, so as to obtain four bars at the same time with the same pot of metal. The bars, which were of course identical, were broken off at the head; two of them were tested as cast, while the other two were rigorously annealed and tested, records being taken of the influence of annealing upon their properties and structure. The results attest the enormous difficulty with which the elucidation of the behavior of the simplest form of steel is attended. A careful investigation of the specific gravities gave negative results, and showed that no correlation exists between the density and the mechanical properties of castings. As in specimens which were compared with one another, the composition and annealing conditions were identical; there was only one condition which could have had a variable influence, viz., the initial temperature of the casting. This might determine a condition of metal which might survive the drastic operation of annealing. This suggestion was offered as a possible explanation, but actual proof awaits the discovery of a means of accurately determining the temperature of molten steel. The author spoke of the hopelessness of generalizing laboratory results obtained with small plain bars and putting forward the generalizations for guidance in works practise. As a practical summary of the lessons taught by these preliminary results, Mr. Arnold affirms that steel consisting of pure iron and carbon is not a suitable material for fulfilling the modern specifications drafted by engineers for steel castings; that the ductility demanded can be insured with ease, but not the required tenacity; that the tenacity can be obtained, but with the almost complete loss of ductility; and with the exception of the nearly pure iron, the castings he had described—that is, without silicon or manganese—have small manufacturing value. Nevertheless, they form the basis on which the mechanical influence of silicon and iron can alone be scientifically measured.

In another paper relating to this subject, on Practical Problems in the Metallography of Steel, Mr. Arnold said that the theory that steels of identical chemical composition would necessarily have the same mechanical properties had long since been discarded. It is a fact that steel of excellent chemical composition, giving highly satisfactory mechanical tests, may nevertheless utterly fail in use; thus, a ductile steel which bends double cold without any sign of flaw or failure may, under the influence of vibration, snap like a piece of glass, though only subjected to mechanical stresses well below its elastic limit. This is proved beyond all doubt by data in the author's possession. In many cases the microscope is capable of giving warning of the dangerous char-

acter of a steel chemically, and apparently mechanically, safe. In order to describe intelligibly the structure of safe and dangerous steels, it is necessary to consider the micrographic constituents of structural steel and the molecular migrations of these constituents when at a red heat the metallic mass is in a semiplastic condition. The constituents of a typical micrographic steel rail containing, approximately, besides the iron, carbon 0.40, silicon 0.05, manganese 0.90, sulfur 0.06, phosphorus 0.06 per cent., together with small percentages of arsenic and copper, are the pale, simple constituent ferrite (in this case somewhat impure iron); the dark etching compound constituent perlite, consisting of mixed granules of iron and of a double carbide of iron and manganese; and the dove-gray simple constituent sulfid of manganese. In manganiferous steels these constituents are completely differentiated visually only under slow cooling from a full red heat. This fact introduces the vital question of the migration of constituents. Sulfid of manganese is not, under working conditions, capable of migrating to any appreciable extent. Thus it remains to consider only the migrations of the ferrite and perlite. On heating the typical steel specified to about 700° C., the compound constituent perlite is converted, with absorption of heat, into the simple constituent, martensite. Then the constituents ferrite and martensite diffuse one into the other till, at about 800° C., molecular equilibrium is eventually established. If, however, the steel be cooled very slowly, the molecules of martensite and ferrite will perfectly segregate in the respective proportions of about 45 and 55 per cent. Then, at about 640° C., the martensite will decompose into the compound constituent perlite, which, owing to the presence of manganese, will be granular and not laminated. On the other hand, if the steel is somewhat quickly cooled in air, the segregation of the constituents will be imperfect, and the apparent proportion of perlite relatively large, because, owing to the influence of the manganese present, the phenomenon of constitutional segregation is retarded. In a case in which the rail was slowly cooled in the reheating furnace during a period of fifty hours, the micrograph showed that the pale ferrite and dark granular perlite had perfectly segregated mainly in the form of thick, alternating laminae. This structure must be regarded as highly dangerous, because under vibration the adhesion between the constituents is liable to loosen gradually and finally to be destroyed. Nevertheless, mechanical tests would inevitably reveal little difference in the ductility of the two pieces of rail. These facts give the clue to the direction in which the steel microscopist must look for danger with reference to rupture under vibration. To obtain complete knowledge of the quality of the steel, three micrographs should be taken, in three planes of section, at right angles to one another—namely, transverse, longitudinal-horizontal, and longitudinal-vertical sections. Usually the preparation of micrographic sections has been too complex a work for practical use in the shop, but the author has devised a simpler method by which the micrographs can be prepared in a very few minutes, which is explained in his paper in *Nature* of April 25, 1901.

Metals as Fuel.—The use of metals as fuel was treated in a thorough manner by Sir W. C. Roberts-Austen in a lecture delivered at the Royal Institution, Feb. 22. Treating the subject historically, the author said that in smelting iron in the old way carbon became associated with it, and in its conversion into steel the iron had to

be decarbonized. In doing this, metallurgists for centuries truly burned some of the iron itself, using it actually as fuel. The most metals as fuel assumed magnificent proportions from the hands of Bessemer. His great service to the steel industry was in demonstrating the possibility of using metalloids and metals as fuel. In a table showing the amount of heat evolved by burning one gram each of certain elements, after carbon and silicon, the first place is occupied by aluminum, which gives out 7,250 calories in the production of Al_2O_3 or alumina. Other items in the table are:

ELEMENT.	Calories.	Products.
Magnesia.....	6,000	MgO
Nickel.....	2,200	NiO
Manganese.....	2,110	MnO ₂
Iron.....	1,790	Fe ₂ O ₃
Iron.....	1,580	Fe ₂ O ₄
Iron.....	1,110	FeO
Cobalt.....	1,090	CoO
Copper.....	600	CuO
Lead.....	240	PbO
Barium.....	90	BaO
Chromium.....	60	Cr ₂ O ₃
Silver.....	50	Ag ₂ O
Carbon.....	8,080	CO ₂
Carbon.....	2,417	CO
Silicon.....	7,890	SiO ₂

This table indicates the advantages which certain metals possess over carbon for use as fuel. The temperature at which such metals as can be used for fuel begin to abstract oxygen from the air depends on the method in which the metals are prepared. Some metals can be made to take fire and burn at ordinary temperatures. They are said to be "pyrophoric." As far as the author is aware, metals in this chemically active state have not been used as fuel; neither has any use been made of the allotropy of metals as enabling them to be used for fuel. The burning of the metal antimony plays an important part in the roasting of silver ores. Aluminum was the metal the use of which as fuel formed the chief subject of the author's lecture. The starting-point of the experiments in this use was the discovery by Charles and Alexandre Tissier in 1856 that aluminum decomposes the oxids of lead and copper. These experimenters, not using the metal in a finely divided state, failed in the reduction of some of the metals. At a meeting of the Royal Society in June, 1894, Claude Vautier showed a few metals which had been produced by this method, including carbon-free chromium and manganese, and gave an impulse to the movement. A lecture on *The Rarer Metals and their Alloys*, delivered by the author before the Royal Society in 1895, is mentioned as the first occasion in which the reducing action of aluminum was demonstrated on a comparatively large scale, and was shown to cover an extended series of metallic oxids. Since that time great progress has been made, the most noteworthy advance having been in the direction of using aluminum for the sake of the heat afforded by its combustion as a true fuel. In this combustion the oxygen is derived not from the air, as when carbon is burned, but from a metallic oxid; when the metals change places the aluminum is oxidized and the other metal set free from its oxygen.

Use of Blast-Furnace Gases.—The inaugural address of the new president of the British Iron and Steel Institute, Mr. William Whitwell, was devoted mainly to a review of some of the many problems in the iron and steel industries still awaiting solution. There were two items of waste in blast-furnace operations, the speaker

aid, which presented problems for solution—namely, the loss of heat contained in the iron, and the slag. The heat lost in 100 tons of pig-iron was equivalent to 4.125 tons of coal. Thus in a blast-furnace plant producing 100,000 tons of Cleveland pig yearly, the heat lost in the iron would be equivalent to that given by 4.125 tons of coal. The total make of the Cleveland district approximated 2,250,000 tons annually, and the heat in that weight of iron would be equivalent to that of 92,800 tons of coal. The heat in the slag was a more serious item of waste. A furnace working on Cleveland ironstone produced 30 hundredweight of slag per ton of pig, or 150 tons of slag to 100 tons of iron. The heat in 150 tons of slag was equivalent to 10.3 tons of coal. Thus in a blast-furnace plant producing 100,000 tons of Cleveland pig yearly, the heat lost in the slag would be equivalent to 10,300 tons of coal. The estimates of the author showed that a total of 2,670,000 tons of slag was produced yearly in the Cleveland district. The heat in that weight of slag was equivalent to 183,340 tons of coal, and if we added to that the loss in the iron, the total amounted to 276,140 tons of coal. At 10 shillings per ton that was equivalent to £138,070 as the sum representing the value of the waste heat in the iron and slag of the Cleveland district. It would of course be impossible to recover all that waste heat and apply it to some useful purpose, but a large proportion of it should be reclaimed; and here was a problem for metallurgists and engineers to solve. Another item of waste was blast-furnace gases, although of late their value for use in gas-engines had been recognized and in some instances they had been employed in that way. The president estimated that the waste from this source going on in the blast-furnaces of the Cleveland district was equivalent to 92,500 horse-power. The utilization of blast-furnace slag was then considered. It had been clearly shown that useful materials could be made from it—its application in the making of paving-blocks, bricks, and slag cement, and as a fertilizer being instanced—and the problem was to make the manufacture of such materials a success commercially, and at the same time to find out some other means of utilization which would consume, if possible, all the slag made. The president spoke approvingly of the attempts being made to extract potassium cyanid from blast-furnace fumes, and the desirability of producing a pure pig-iron equal to the Swedish, as was done in America.

The Profitable Utilization of Power from Blast-Furnace Gases was the subject of a paper read by Mr. B. H. Thwaites at the Glasgow meeting of the Iron and Steel Institute. The author suggested that in Great Britain, at least, the blast-furnace might be made the center of cheap electric power supply areas, and pointed out that its function might under certain conditions become a dual one, with the production of iron occupying a secondary place. Thousands of horse-power were being developed on the Continent at the present time by the direct combustion of blast-furnace gases, and with a thermal expenditure that a few years ago would have been thought unattainable. Numerous directions were suggested in which electric energy might, under suitable conditions, be made available for industrial purposes.

A dynamic method of cleansing blast-furnace gases from dust, so as to make it possible to use them for gas-engines, was described before the Iron and Steel Institute by Mr. Adolphe Greiner. It is based upon the principle of throwing the dusty gases and a spray of water together by an ordinary centrifugal fan against the periphery of

the apparatus. The liquid and solid particles are then expelled by an opening in the envelope, and led away therefrom by a pipe in the lower part of the fan casing, while the gases, which have become well mixed by the action of the rotating blades, escape the orifice ready for use without further treatment.

The progress in the use of blast-furnace gases in metallurgical practise has been very rapid, and it is claimed in *Nature* of Jan. 3, 1901, that all the difficulties in the way were successfully overcome during 1900. A list of more than 33 blast-furnace engines of from 200 to 1,000 horse-power each, in operation in different European establishments, is given by Prof. Joseph W. Richards in the *Journal of the Franklin Institute*. This author makes a calculation based upon the figures from a blast-furnace plant in eastern Pennsylvania showing that a very great saving of power is possible by the economical utilization of the blast-furnace system.

Iron and Steel.—In a paper on the Correct Treatment of Steel, in considering the effect that composition and initial treatment have, as compared with subsequent treatment, on the ultimate properties of steel, Mr. C. H. Ridsdale said that too much importance is attached to the composition *per se*, and too little to the right treatment. He observed that every steel has a composition of its own, and that a specimen made by one process might be softer than a similar metal made by another process, so that to condemn the second as bad because it suffers under certain treatment suitable to the first is obviously wrong. Dealing with the effect of work on steel at different temperatures, Mr. Ridsdale said that in cooling from the molten condition the iron crystallizes first, but the grains have no cohesion, owing to the softness of the impure mother-mass or cementing portion, so that the material will easily break or be red-short. As the cement becomes more plastic, the metal can be readily worked, since the grains can move freely in it, but in cooling, the grains are likely to grow and produce brittleness. At a lower temperature (about 1,000° C., orange or bright red heat for soft steel), the critical point is reached in which the cement and grains are of equal hardness. Work at this stage breaks up the grains and imparts toughness by the interlocking of the grains and cement. If the finishing temperature of rolling be high, the metal will soften, but may become brittle with slow cooling, while if it is too low, the hardness of rolling is not entirely eliminated, so that the temperature of finishing should be between these tendencies. The relative plasticity of the two constituents becomes low through the lower or red-heat stages until it reaches the minimum stage at blue heat, about 316° to 370° C. At this stage the metal does not uniformly receive the force applied to alter its shape, and critical strains are set up, which, owing to the low temperature, have not time to adjust themselves during further cooling. The resultant metal is liable to rupture with sudden shock, or may yield to a slowly applied strain. As the temperature gets below straw heat, 250° C., and until cold, the steel is more plastic than at a blue heat, but becomes tender again below zero. If a coarse-grain steel is rapidly heated, the grains are broken up more efficiently than if it is slowly heated.

The results obtained in an investigation by W. N. Hartley and Hugh Ramage of the spectra of flames resulting from operations in the open-hearth and basic Bessemer processes were different from those which had been previously obtained by observing the acid process. The con-

tinuous spectrum was much stronger. Many lines and bands new to the Bessemer flame spectra were observed. Twenty-six plates of spectra were photographed. The spectra increased in intensity as the blow proceeded in the first stage, a result which could come only from a corresponding increase in the temperature of the bath of metal and of the flame. Difficulty was experienced in the identification of some of the lines and bands; some were due to uncommon elements, and others were relatively much stronger than a study of the oxyhydrogen flame and other spectra of the same metals had hitherto shown. Line spectra were not observed in the open-hearth furnace—a circumstance attributed mainly to the fact that the atmosphere of the furnace is oxidizing, when only sodium gives a spectrum approaching in intensity that which it gives in the reducing flame. Among other differences between the phenomena of the basic Bessemer blow and those of the acid process, are that in the former a flame is visible from the commencement of the blowing; that volatilization of metal occurs largely at an early period in the blow; that a very large amount of fume is formed toward the close of the second period; that the overblow is characterized by a very powerful illumination from what appears to be a brilliant yellow flame; and that the spectra of flames from the first stage differ from those of the acid process in several particulars—the manganese bands being relatively feeble, and lines of elements not usually associated with Bessemer metal being present. Differences were noticed in the intensity of metallic lines, it varying with the amount of metal in the charge, and also with changes of temperature; as the temperature of the flame rose, some lines faded almost away, and others became stronger. The changes were more marked in the arc spectrum and still more in the spark spectrum of iron. A new line of potassium, with somewhat widely variable intensity, was observed.

A new iron process described by A. v. Forselles consists in melting in the blast-furnace a mixture of apatite, or some other phosphatic rock, with charcoal, scrap-iron, and suitable fluxes. The products obtained are a slag rich in phosphorus, which is sold as manure, and a pig-iron that contains phosphorus and can be made use of in the Thomas or basic steel process.

Brinell's method of determining hardness and other properties of iron and steel, as described by Axel Wahlberg, of Stockholm, consists in forcing, by means of pressure, a hardened steel ball into the material tested, so as to cause an impression, the diameter of which is then to be measured, in order to obtain the spherical area of the concavity. The quotient resulting from dividing the maximum pressure by this area will represent what is called by Brinell a *hardness number*, indicating, according to him, the amount of pressure (kilograms per square millimeter) to which the material in hand has been subjected. With this method several researches have been carried out, detailed particulars of which are given. They relate to the determination of the hardness of various metals, controlling forging tests, and to the hardness of iron and steel. Under this head, experiments were made to ascertain the influence of the percentage of carbon on the hardening capacity of different quenching liquids, the influence of the temperature of the quenching liquid on the hardening result, and the influence of different hardening temperatures. Other researches described dealt with an attempt to ascertain the homogeneity of iron and steel, the degree of annealing, the influence of cold-working deter-

mination of the yield point, alteration of shape and elongation, and tests of blank and cold-chamber dies.

Observations on the product of a tin-bearing basic Martin furnace in which tin was accidentally present are recorded by A. Züggen. The product was a metal containing 0.55 per cent. of tin, 0.03 per cent. of antimony, 0.03 per cent. of arsenic, and 0.182 per cent. of copper, rolled quite satisfactorily to plate. On further rolling to sheet, cracks began to develop on the edges of the sheet, but they could not, as it proved, be attributed to red-shortness. Bars rolled from the ingot folded completely over under the cold hand test, and showed a tensile strength of 40 kilograms, with an extension of from 31 to 34 per cent. It appears to be proved from this that the presence of 0.55 per cent. of tin in iron or steel does not affect its malleability, tenacity, or extensibility. The welding qualities at most are unproved. In other experiments bearing on the same matter reported in *Stahl und Eisen* and the *Chemiker Zeitung*, samples of iron containing from 0.1 to 0.63 per cent. of tin, when tested, all forged well. On rolling, the samples containing more tin split more readily at the edges. All except the one with 0.63 per cent. of tin, rolled well. They bent satisfactorily, both hot and cold. The tin was irregularly distributed in the ingots. Crucible steel was prepared, containing 0.23, 0.50, 0.68, and 0.62 per cent. of tin. All samples forged well, but the last was somewhat red-short. Some of them would weld. The breaking stress was 72.3–73.9 kilograms per square millimeter.

Experiments are described by F. H. Williams, of Pennsylvania, which go to show that copper reduces the corrosion of soft steel to within that of wrought-iron, and has a similar effect upon the susceptibility of the latter metal.

In a paper on the influence of copper on steel rails and plates read before the Iron and Steel Institute in May, J. E. Stead and John Evans remark that it is generally thought that copper has a very deleterious effect upon the metal, so that engineers when buying steel frequently specify that it must be absent. The observations of the authors show that this general opinion is erroneous, and prove that between 0.5 and 1.3 per cent. of copper has no deleterious effect upon either the hot or cold property of steel; that a very large amount (2 per cent.) makes the steel more liable to be overheated; and that in small quantities it slightly raises the tenacity and elastic limit, but, unlike phosphorus, does not sensibly make the steel liable to fracture under sudden shock. Like carbon, it reduces the power of the steel to extend under stress; but this is not pronounced when the quantity is small. The effect is more marked when large quantities of copper are present. The authors furthermore prove that if the evidence of the open-hearth steel trial can be confirmed, copper, instead of producing red-shortness, has the contrary effect of changing red-short steel so that it will roll without cracking.

In a discussion on the properties of steel containing nickel published in the Report of the Congrès International des Méthodes d'Essai, the principal changes in passing from ordinary steel to steel containing a considerable proportion of nickel are defined as being the lowering of the temperature of transformation of the carbon, the fusion of two of the transformations, and the exaggeration of the phenomena accompanying the double point. In ferro-nickels containing traces of carbon, but more than 20 per cent. of nickel, the transformations are determined by the nickel, while the carbon acts as a retardant. The magnetic properties appear to be due to a certain

molecular transformation which takes place with evolution of heat, and when this molecular grouping is prevented by the presence of some other body, the metal may be reduced to ordinary temperatures without exhibiting magnetic phenomena. Ferro-nickels are compared by the author of the paper to solutions rather than combinations. It is suggested that by the addition of nickel many properties of steel may be studied at temperatures considerably below those at which they occur in pure steel. As an example are mentioned the gradual changes of volume which take place in the course of years, and which in the case of nickel-steels may be observed at the temperature of the laboratory; whereas it would be impossible to study similar changes at an elevated temperature in pure steel.

Treating of nickel-steel as used in commercial work. H. F. J. Porter said at the autumnal meeting of the Iron and Steel Institute that that metal has a lower melting-point than ordinary steel with the same carbon content. In the cooling process, nickel tends to reduce segregation and liquation, so that an ingot of nickel-steel is more homogeneous throughout than one of simple steel, and is less prone to form blowholes. Nickel-steel in process of manufacture is very sensitive to changes of temperature. Therefore, in forging or rolling it, care must be taken to maintain a uniform temperature throughout the body of metal. The tensile strength and elastic limit of this steel are somewhat reduced by annealing, but are raised by oil tempering to an extent beyond that to which the annealing has lowered them. Forgings of it are not hard to machine, but are exceedingly tough. For ordinary forgings, nickel-steel of from 3 to 3.5 per cent. of nickel and 0.25 per cent. of carbon is used. It has from 20 to 30 per cent. greater elongation than simple steel of about 0.50 per cent. carbon, with practically the same elongation and reduction of area. Nickel-steel forgings of high elastic limit are considered best for service where rapid alternations of tensile and compressive stresses are applied. Ordinary steel corrodes about twice as much as nickel-steel of the same carbon content on submersion in salt water. Five per cent. nickel-steel with 1.25 per cent. of carbon, after oil tempering and annealing, has an elastic limit of from 150,000 to 175,000 pounds per square inch, and is especially serviceable for hydraulic cylinders, when very high bursting pressures are applied.

Gold and Silver.—A perfected apparatus of dry concentration, called the Crown concentrator, is based upon the following mechanical principles: 1, That bodies of unequal size but equal weights will fall together; 2, that bodies of equal size but unequal falling weights will not fall together; 3, that the influence of specific gravity upon a falling body increases or decreases proportionately to the density of the medium traversed by the body; 4, that all mineral particles, however finely divided, will in falling, if of equal size and left free to act, arrange themselves in accordance with their specific gravities. The ore is crushed and then put through a series of rolls gaged to give pulps of the necessary fineness, and without reducing the sulfids to a slimy powder. The pulp is then conveyed by a carrier-belt to a sizer, where the particles are sorted according to their fineness, and then to the concentrators, each load of particular fineness being concentrated separately. Finally all the concentrates are delivered into one receptacle and all the waste to one dump, unless for some particular reason it should be desirable to deliver the particular sizes separately.

At Mount Morgan, in Queensland, Australia, the low-grade gold ores are extracted with a prepared solution of chlorin in water, locally termed "solution," and are not "gassed" as in the usual methods. At the plant of the new West Works, which deals with 100,000 tons per annum, the chlorin is made from salt, dioxid of manganese, and sulfuric acid. The gas from the stills is dissolved in water trickling over pieces of glass, etc., with which the towers are filled. The solution runs into the storage tanks, which are covered at the top and worked by pipes and valves in the base operated from above. The vats have a wooden perforated false bottom, and layers of gravel and sand of diminishing size are laid upon it. The ores are thrown into this bed and the chlorin solution runs over it. The gold liquor is drawn through and out from below by a small vacuum of 5 pounds per square inch, and passed on to the storage tanks. Fresh chlorin solution is run in until the exit liquor contains plenty of chlorin, when the ore is washed through with water. The gold is precipitated by passing the liquor through a 2-foot bed of crushed charcoal, lying on a cloth on the wooden perforated false bottom of the filtering vat, the charcoal being afterward burned and the ashes smelted for the metal. An extraction of 92.06 per cent. was shown. The richer sulfid ores, which contain about 4 ounces of gold to the ton at the top works, are, after they have been roasted, treated by the same process, and they then show an extraction of about 95 per cent.

In the extraction of gold from its ores by means of the battery amalgamating process, electro-silvered plates have replaced in most instances the plain amalgamated copper plates, since the latter become more or less tarnished with copper salts, which prevent amalgam or quicksilver from adhering. Attention is called by J. R. Cooper to the fact that all copper contains more or less cuprous oxid, and that, as this oxid does not combine with mercury, a plain copper plate can be only imperfectly amalgamated. Even if at first the whole plate is coated with quicksilver, this will break off from the oxidized parts, and the latter will be exposed to the action of water, oxygen, carbonic acid, etc.

The tailings coming from mills which leach gold ores with potassium cyanid always retain more or less gold, and usually at least one-quarter of the potassium cyanid and more or less free caustic alkali per ton. H. M. Crowther finds that if care is taken to add to the last wash water from one to several pounds of caustic alkali, the tailings will retain sufficient alkali to protect the residual potassium cyanid and allow it to have its solvent effect upon the residue in the tailings, which are being slowly affected by the action of air, moisture, and warmth.

To the millman considering the expediency of using electro-silvered plates in gold milling in preference to plates of copper, the important question, Mr. Edward Halse says, is whether the silvered plates extract more gold from the crushed ore than the copper ones do. The author is convinced from his own experience that this is the case, and that silvered plates therefore should supersede plain copper plates in this work; and he offers many tables of results in support of this view. In the discussion that followed the reading of Mr. Halse's paper, it was pointed out that in many cases the percentage of gold obtained was low in consequence of the failure of the millman to keep his plates clean; and the importance of the use of "elbow-grease" rather than chemicals was strongly emphasized.

Aluminum.—Most of the investigations having for their object the use of aluminum as a source of heat have been conducted by Dr. Hans Goldschmidt, of Essen, and it is through his labors, according to Sir W. C. Roberts-Austen, that metallurgy is entering upon a new phase. In its simplest form, Dr. Goldschmidt's process consists in igniting a mixture of oxid of iron, ferric oxid, and finely divided aluminum. To this mixture the name of "thermit" is given, and several varieties of it, adapted to various kinds of work, are used by Dr. Goldschmidt at his furnaces. The mixture is placed inside of a crucible and ignited by a small piece of magnesium wire, which serves as a kind of wick if it is placed in a little heap of calcium sulfate and aluminum. The aluminum extracts oxygen from the oxid of iron (for instance), and a sufficiently intense heat is produced, not only to melt the iron which is liberated from its oxygen, but also to melt up the slag, and, further, to leave a considerable surplus of heat, which is available for doing other work. No known pyrometer will enable the heat to be measured. The author believes it is about 5,000° C. The ignited and molten mass in the crucible is so intensely hot that it may be made to unite surfaces of steel that require to be joined, such as the ends of the lengths of rails, it being applied, as the author compares it, as a hot bandage might be applied to a wound in surgical treatment. Its work is well comparable with that of the electric arc. The very hot molten iron may also be used for repairing defective castings. By mixing other metallic oxids with the iron oxid, the metals they contain are reduced and alloy themselves with the iron, and the composition of the defective casting can thus be matched. It is likewise possible to produce directly steel of a suitable degree of carburization. The use of aluminum as a reducing agent has been dwelt upon in other years. Manganese and chromium containing only small quantities of carbon are now produced on a large scale for industrial use—metals which are important, chromium in the metallurgy of steel and manganese in that of copper. Alloys of manganese and zinc are likely to prove of value. Other alloys that have been thus obtained are those of manganese and chromium; ferro-titanium; of titanium and manganese; of iron and boron; ferro-vanadium; and of lead and barium. The solid product of the combustion of aluminum is alumina of a high degree of purity, in the specially interesting form of ruby-tinted crystalline masses resembling the natural ruby.

In using aluminum as a fuel or as a reducing agent the question arises as to what extent it must be heated before it will begin to extract oxygen from the air or an oxid. The presence of a little mercury, Sir W. C. Roberts-Austen says, enables aluminum to oxidize more readily, and it will burn sooner in oxygen if its combustion is started by a fragment of charcoal. The temperature at which it will abstract oxygen from a metallic oxid will depend upon the oxid submitted to the action.

A new method of precipitating pure alumina described by C. M. Hall consists in charging bauxite (calcined at a red-heat if necessary), burned lime, sodium carbonate, and water into a digester provided with a stirrer and subjecting the mixture at a considerable pressure to an elevated temperature for from one to three hours. Insoluble carbonates and silicates and inert impurities of the bauxite, such as iron oxid insoluble alumina, etc., will form a residue to be separated by filtration from the insoluble sodium aluminate. From the latter aluminum hydroxid is

precipitated in the usual way by carbonic acid and filtered off. The filtrate, with its excess carbonate, is concentrated by heating and used again with another charge.

In experiments by L. Tetmajer, the best alloy of aluminum brass was obtained with 3.4 per cent. of aluminum, while hard alloys were made with 1.4 per cent. The breaking strain fell rapidly with increasing percentages of aluminum. Silicon acted in the same manner. The experiments with aluminum bronze showed that up to from 5 to 10 per cent. of aluminum the strength increased, while the breaking strain fell. The presence of iron and silicon gave similar results. It was further shown that a 10-per-cent. aluminum bronze containing 1.5 per cent. of iron and silicon was too brittle for ordinary use. Pure aluminum was malleable when cold, as was also the bronze. When, however, the quantity of aluminum in the latter amounted to 10 per cent., the malleability had practically vanished. When hot, the bronze was plastic, malleable, and easily rolled. Hard aluminum bronze wears well in use. The best-rolled bronze contains from 8 to 10 per cent. of aluminum and silicon together.

With a new modification of the Goldschmidt process for aluminothermic welding and casting (see *Annual Cyclopædia* for 1900, p. 361), by L. Cohn, an ordinary workman can effect a good weld. The "thermit" mixture (of which 1 kilogram yields 150 grams of molten iron) is placed in a crucible made of iron plate lined with refractory material, mounted on a substantial tripod and closed at the bottom with one or more small iron plates, according to the quantity of thermit used. The thermit is covered with a layer of kindling or priming mixture and an iron plate with a central hole, through which the charge can be ignited by means of a fusee, is placed over the whole. The crucible thus prepared is placed with its tap-hole immediately above the gate of a refractory mold built around the ends of the two rails to be joined, which are so clamped together that the surfaces to be welded are pressed against each other. In a few seconds after the charge is ignited the contents of the crucible should become fluid, and melting away the supporting plate, should flow into the mold and make the required joint. In this process it is the molten iron that first enters the mold, and the molten corundum slag floating on the top passes out last instead of first, as in the older teeming process. The method lends itself well to the jointing of rails already laid, and insures a sound electrical contact; it is of no use, however, for rails of which the ends are worn. The process can not well be applied to the welding of tubes, as the hot metal is liable to melt its way through the tube at first contact. It is, however, very suitable for the repair of broken shafts or rails, and is especially recommended for use on board ship, as the appliances required are exceedingly simple and convenient.

Zinc.—Among metallurgical problems mentioned by J. W. Swan in his presidential address before the Society of Chemical Industry as still awaiting satisfactory solution, one of the foremost in importance is the economical extraction of zinc from its ores. The present methods in use are very wasteful, and a practicable electrolytic method is much to be desired. The difficulties in the way of a successful electrolysis have not yet been fully overcome. Experimental operations at Hayle, in Cornwall, by the process of Cowper-Coles gave indifferent results. At Milton, in Staffordshire, fairly satisfactory success was obtained with the Swinburne-Ashcroft fusion process; and

the inventor hopes by slight modifications to make it practicable. Specimens of 99.96 per cent. purity were exhibited at Glasgow by Brunner, Mond & Co., which, according to Mr. Swan, were made electrolytically on lines suggested by the Hoelfner process.

In a process for extracting zinc from waste products patented by C. Kellner, the waste products resulting from roasting pyrites are treated with water and sulfuric acid. The bisulfid of zinc so obtained is oxidized by air into the sulfate, which is then mixed with the chlorid of an alkali or alkali earth—preferably sodium or calcium chlorid—to convert the sulfate into chlorid of zinc, with the formation of an alkali sulfate; and finally, the chlorid solution is electrolyzed to obtain zinc and chlorine, "whether or not the sulfate be caused to crystallize out of the electrolyte." The sulfate may be crystallized by electrolyzing the liquor until it is sufficiently concentrated, or by cooling or evaporating.

It appears from a consular report on the production of zinc in the United States, that while the gain in Europe during the past ten years had been just over 27 per cent., the production in the United States had increased 115 per cent. The increase in the American product since 1880 had been 437 per cent.

Copper.—It is proposed by Victor Pizet and Juan Torricio y Meza, of Lima, to establish in Peru an industry for the reduction of copper mattes into bars of pure copper by the Manhés process, or Bessemerization. The fundamental principles of this method are: (1) The production of pure copper instead of rich mattes that always contain from 30 to 40 per cent. of foreign substances; (2) the reduction of the consumption of coal to such a point that the cost of the whole process is altogether disproportionate to that of the present production of mattes containing from 50 to 70 per cent. of copper.

The improved process of H. J. Martin for manufacturing copper, yellow metal, and brass consists in utilizing the heat resulting from the operation of refining copper for the purpose of carrying out the rolling in the breaking-down and drawing-out stages, thus doing away entirely with any reheating in the furnaces usually employed for these operations in the existing mode of manufacture. The process is applicable to the manufactured alloys, such as yellow metal, normal brass, and the like, which require to be rolled hot. Practical advantages in manipulation are claimed for the process.

Alloys.—In a Cantor lecture before the British Society of Arts on the Microscopic Structure of Alloys, Dr. T. Kirke Rose first dealt with the new method of preparing specimens for examination suggested by Mr. Hannover. This method is designed to be used instead of the ordinary polishing materials, in the case of very soft or brittle specimens. It consists in pouring the molten alloy on a surface of mica, and allowing it to solidify. The smooth surface thus obtained can be examined and photographed under a magnification of 850 diameters. The various structures in alloys observed by the microscope and lantern slides of different purely metallic chemical compounds were shown in connection with the lecture, and the different modes of isolating them and proving their existence were indicated. A case was cited in which a compound in an alloy is of technical value, viz., in the antifriction alloys used for axle and shaft bearings. In all these alloys a hard constituent exists, which takes the weight of the axle, and the crystals of this hard compound are embedded in a soft matrix which

molds itself to the shape of the axle. The lecturer referred to the use of the nickel alloys in boiler-tubes, and other cases in which great strength and toughness are required, together with an almost complete absence of expansion or contraction with changing temperatures.

While alloys containing equal parts of zinc and aluminum or more zinc than aluminum have no specially valuable mechanical properties, the case, according to J. W. Richards, is different when aluminum prevails over zinc. The alloy 2 parts of aluminum to one of zinc, or 33 $\frac{1}{3}$ per cent. of zinc, has a strength according to Durand equal to that of cast iron. It melts at about 425° C., fills the joints of a mold perfectly, does not oxidize readily, and takes a fine finish. It is brittle, but resists corrosion well. A tensile strength of 40,000 pounds per square inch can be obtained. Such a casting resembles a high carbon steel, but works well under tools, and does not require lubrication. Its high specific gravity of 3.8 shows that great contraction has taken place in the formation—namely, 17 per cent.—and thus suggests a cause for its great strength. The alloy 3 parts of aluminum to 1 of zinc—that is, about 25 per cent. of zinc—is the one most generally used. It is softer than the alloy with 33 $\frac{1}{3}$ per cent. of zinc (above), has a tensile strength of 35,000 pounds, and is less brittle. Its specific gravity is 3.4, showing a contraction of 14 per cent. With alloys containing less than 25 per cent. of zinc, the strength and hardness decrease quickly. An alloy with 10 per cent. of zinc and less can be forged, rolled, and drawn.

Ferro-silicon is referred to by J. W. Swan, president of the Society of Chemical Industry, as one of the alloys now produced on a commercial scale by the electric furnace. At present the demand for it is small, and the manufacture is in excess, but it is hoped that there will be in time large use for it in the manufacture of steel to make available the improvement of quality which silicon imparts to the metal when there is not an excess of carbon, and to take advantage of its thermal energy in steel casting. At Meran, in the Tyrol, where ferro-silicon is made at a cost of £8 a ton, the raw materials used in making it are scrap-iron, quartz, and coke. The product contains 77.5 per cent. of iron and 21.5 per cent. of silicon.

For the purpose of discovering the nature of the changes that take place during the arrests that occur in the progress of the cooling of substances that have solidified from a molten condition, Messrs. C. T. Heycock and F. H. Neville took a definite alloy of copper and tin, and allowed it to cool after melting. A part of the sample was chilled while still partly fluid, at 740° C., and was found on microscopic examination to contain large primary combs, considerably richer in copper than the mother substance. Another portion was chilled at 630° C., or not less than 100 degrees below the point of solidification. It showed no difference in composition, but was apparently homogeneous. In another portion, chilled to 500° C., crystallization was found to have taken place in the solid solution, with the production of rosettes and bands of a substance rich in tin within a medium rich in copper.

A mild ferro-chromium made in the electric furnace and containing 60 per cent. of chromium, from 39 to 29 per cent. of iron and carbon reduced to 1 per cent., patented in France, is distinguished from ordinary ferro-chromium by being magnetic, tough, not scratching iron, and being capable of being drilled by steel.

Processes.—By observing the effects of different natural pressures according to differences of

elevation, it has been suggested that advantages might be gained in reduction processes by working under pressure, and notably an economy of time. By thermal calculations it is shown that if reduction be effected at a pressure of one atmosphere above the normal, the time of reduction may be shortened by one-half, the external heat applied being of course increased in correspondence with the lessening of the time, and the ore being sufficiently finely crushed to allow of the reaction being completed in the shorter period. By doubling the difference of temperature between the inside and the outside of the reduction vessel, the time of reduction may again be shortened one-half. Such a pressure furnace (working at +1 atmosphere pressure) has been tried by Bessemer. Cast steel has been made experimentally in a similar way at a Westphalian works.

The process of magnetic concentration of ores of Messrs. Ettinger & Co. is based on the fact that all substances behave differently under the influence of a strong magnetic current. The machine employed consists essentially of two parallel bar electro-magnets, one above the other, the upper one being cylindrical and the lower one either cylindrical or semicylindrical. The ore to be tested is fed in a crushed condition between the poles of the magnets by means of an adjustable inclined shoot, slightly pressed by a spring against the upper cylinder. The paramagnetic particles adhering to the cylinder are carried round by its rotary movement, and faintly magnetic particles soon reach a point where centrifugal force and gravitation overcome magnetic attraction, and consequently drop into a shoot prepared to receive them. In the meantime, the more highly magnetic particles, adhering longer to the revolving cylinder, drop into another shoot placed farther from it. The following minerals are separated in this way: magnetic ores, all iron ores, compounds of titanium, tungsten, nickel, cobalt, and manganese, oxidized and sulfid ores of copper and certain sulfids of zinc, lead and silver ores, tin ores, and compounds of bismuth. The advantages claimed for this machine are the large output, slight liability to wear and tear, and the slight expenditure of electrical force involved.

The Phoenix process of sulfid-ore treatment, described by Mr. E. A. Ashbridge before the Institute of Mining and Metallurgy, consists of a cycle of four main operations. The first is the displacement of the sulfur combined with the metals in the ore, by means of chlorin gas; this is done in a converter, to which the ore, mixed with fused zinc chlorid, is introduced at a suitable heat at the top, while the dry gas is injected from below. The chlorids of sulfur being produced only at low temperatures, the action is carried on at a heat of at least 650° C., whereby sulfur is vaporized and carried away for condensation, while fused chlorids of metals mixed with silicious gangue remain behind and are tapped. The sulfur, with which is associated a small quantity of chlorids, chiefly of iron and zinc, is washed with water to purify it. The second step is the desilverization of the residue, with the production of argentiferous lead, and the separation of the remainder of the lead from the mixed chlorids. This is done by adding zinc, which throws down the lead from the fused chlorids, or by electrolysis. The third operation is the separation of the silicious gangue (which is unacted on) from the zinc chlorid by settlement and decantation, the gangue being freed from the chlorid by washing with water or by distillation—the former being preferable. The final chlorid is purified, the wash chlorid solutions are boiled down, and the whole

of the zinc chlorid is prepared for the fourth operation of electrolysis. Hereby the zinc is recovered as metal, and the chlorin is pumped back for reuse with fresh ore in the first operation.

The older methods of manufacturing pipes by drawing, rolling, or bending over a mandrel were in time superseded by the lead-pipe process in which molten lead is placed in a heated container, and when cooled down to plasticity is forced through a die by hydraulic pressure. By this means, instead of only short lengths of pipe being made, as with the old methods, pipes of any required length are produced. In the improved press of Mr. Alexander Wylie, the container, instead of being kept hot by a fire or a ring of gas-jets, is jacketed and steam-heated. In an important adaptation of this press to the encasing of telegraph-cables, the cable passes horizontally through a case, and the covering is done continuously, rapidly, and effectively. By the extension process of Mr. Alexander Dick, all kinds of bars, from a simple round wire to complex sections which it is impossible to roll, and tubes of any section are produced by causing metal heated to plasticity to flow through a die under hydraulic pressure. This process consists in charging the hot metal into a horizontal container, at the front and rear of which is the die. Upon hydraulic pressure being applied at the rear end of the container, the plastic metal is forced through the die, issuing therefrom as bars and tubes. The quality of the metal is greatly improved in the bars thus produced. It acquires increased density and is perfectly homogeneous. Extended bars of given length yield higher results under test for tensile strength than rolled bars of the same metal, and it works better in the lathe or screwing machine at speeds twice or even three times as great as those employed with ordinary metal. Mr. Dick's process is likewise applied to copper and its alloys, but these metals are operated on at a far higher temperature.

A method has been devised by Mr. Thomas A. Edison for obtaining a more permanent phonographic record than the wonted one by means of gold plating. The wax cylinder carrying the record is revolved in a vacuum between two gold electrodes. A vacuum discharge is passed, and the gold is deposited. By electrodeposition the layer of gold is backed up with copper, and the wax is then melted off. A deposit of silver is then electrolytically laid upon the copper matrix, and as soon as the silver layer is of the required thickness the copper is dissolved off. There is thus left a silver deposit containing a thin layer of gold, and the record is, it is hoped, an exact reproduction of the original wax; but its exactness has not yet been fully tested.

The Riecken process for treating tellurid and sulfid ores is an electrochemical system for the recovery of the various metals from ores by a single operation, without resorting to filtration. The machinery consists of an open iron tank with vertical ends, inclined sides, and rounding bottom. The tank is provided with a horizontal shaft passing through stuffing-boxes at each end, also with proper beaters to agitate the contents of the vat, and with suitable gear-wheels outside of the tank for rotation. The bottom and sides of the tank are lined with removable amalgamated copper plates, and form the negative pole of the circuit, the positive pole being stationary. By means of a small force-pump a stream of mercury is caused to flow continually over these amalgamated plates, which, running down into the bottom of the vat, is drawn off through a mercury tap and again elevated by the pump,

thus maintaining a continuous circulation. This not only keeps the negative pipes perfectly bright and active, rendering the apparatus the best mechanical amalgamators, but is the essential condition which effects the precipitation of the gold in such a form that it can not be scoured off by the attrition of the moving ore. By means of this apparatus the gold, whether in coarse particles or fine, is recovered in one operation, no filter presses are required, no precipitation by zinc is necessary, and the bullion commands a high price by reason of its purity.

In the agitation process for grinding slimes, as carried on at Bland, New Mexico, the low-grade slimes are agitated with potassium cyanid for twenty-four hours, while steam and compressed air are admitted to pass into the solution through a number of perforated pipes placed along the bottom of the vat. A due proportion of lime charged into a wire bucket suspended to reach below the surface of the solution neutralizes any acid reaction of the pulp, and aids later in settling the slimes. After treatment the pulp is run from the agitating tanks into wire settling tanks placed in series, from which the overflow is made to pass through upward filtering tanks before it goes to the zinc boxes. From the settling tanks the slimes are sluiced out into decanting tanks and allowed to settle for from twelve to twenty-four hours. The other solutions, drawn off through openings in the side, are mixed with the liquors from the wire settling tanks before they pass through the filtering tanks.

Pyritic smelting is defined by H. Long as a matting blast-furnace smelting process, in which parts of the metallic sulfid are oxidized, thereby giving a more concentrated product. The degree of concentration depends mainly on the proportion of silica in the charges. As the silica increases, the matte fall decreases, as does also the smelting power, because slags, when acid, run more slowly than when basic. Thus a furnace with a charge rich in pyrites, run from a basic slag, will give much low-grade matte, and put through large quantities with little fuel. Advantages are claimed by S. E. Bretherton for this process in comparison with lead smelting in respect to the high percentage of gold and silver it saves; in that it permits a high degree of concentration in working ores with from 1 to 2 per cent. of copper; and in that it allows a larger per cent. of zinc in the charge, as well as more silicon and silicious slags.

Miscellaneous.—In his report as deputy master and comptroller of the Royal Mint, Sir William C. Roberts-Austen points out that of late years a change has gradually been effected in the metal for striking medals which are known by the general name of bronze. Until comparatively recently, such medals were invariably struck in copper, which subsequently received a superficial coating mainly consisting of an oxid of copper, and the medal was said to be "bronzed." Such a "patina" was formerly imparted to the copper medal by heating it in contact with iron. The Japanese have long employed a wet method, by the aid of which a wide range of shades of brown can be imparted to copper. The solutions are used boiling, and a variety of verdigris known as "Rokusho" and sulfate of copper are the main constituents. The Japanese, moreover, are very successful in imparting a more or less translucent but permanent coating to the copper, which in fine examples of their art reveals the crystalline structure of the metal beneath the "patina." Sir W. C. Roberts-Austen observes that in the years 1897-'98 more than

28,000 medals in commemoration of the Queen's jubilee were treated in this way, and the specimens that have been preserved in the mint show no diminution in the brilliancy of the tints which were originally imparted to them. Many European mints are following the Paris Mint in efforts to replace pure copper by copper alloyed with other metals. Analyses of coins of the reigns of Hadrian and Trajan show that the alloys contained about 87 or 88 per cent. of zinc, the remainder being made up of tin, lead, iron, and silver, with traces of arsenic and antimony. The author remarks that modern medallists are working with alloys that resemble those from which the coins mentioned were struck, so that the medallist of to-day is returning to the ideas developed in ancient Rome.

Some clearly defined idiomorphic crystals were described by E. J. Stead at the meeting of the Iron and Steel Institute in May as having been discovered in the hearth of a blast-furnace in Monmouthshire situated in a cavity of the sandstone foundation, where spiegeleisen and ferromanganese had been made. They belonged to the orthorhombic system, and are described as a carbosilicid of manganese and iron. Their composition was: Manganese, 51.75; iron, 35.76; silicon, 3.62; carbon, 3.71; oxygen, etc., 5.16.

In a paper on the presence of calcium in high-grade ferro-silicon, read at the meeting of the Iron and Steel Institute, Mr. G. Watson Gray pointed out that high-grade ferro-alloys, especially those produced in the electric furnace, had of late years presented many interesting points to the metallurgical chemist, and some troublesome ones to the analyst. Having recently come across ferro-silicon containing calcium, and not having noticed the occurrence of that element in a ferro-alloy recorded before, he submitted his experiences in the matter, so that the presence of calcium might be noted by users, and its good or ill effects on steel observed.

Mackey's amalgam press, a piston press worked by steam, air, or water, removes in a better way than is possible by ordinary means the surplus quicksilver from amalgam, thus enriching the amalgam and reducing the amount to be retorted.

Electrolytic deposits of chromium obtained by Neumann are bright gray and lustrous, but have a tendency to peel off, due to films of oxid. They are hard and brittle and very pure, containing only from 0.1 to 0.2 per cent. of iron, and, like ordinary chromium, occur in the active and passive states.

Osmium, which has the highest melting-point of all the metals, has been reduced by Auer von Welsbach to a filamentous condition, when its qualities as a conductor were found to be such that it could be applied in the place of carbon for incandescent electric lamps. It can withstand a higher temperature than carbon, and in practice affords a higher illuminating duty and is more durable.

A gift of \$32,000 has been made by Mr. Andrew Carnegie to the British Iron and Steel Institute, the income of which is to be applied to the awarding annually of one or more research scholarships of such value as may appear expedient to the council of the institute. The object of the scheme of scholarships is to enable those students who have passed through a college course, and also who have been trained in industrial establishments, to conduct independent researches in the metallurgy of iron and steel and allied subjects, with the view of aiding its advance or its application to industry.

METHODISTS. I. Methodist Episcopal Church.—The Conference organization of this Church consists of 127 annual conferences, 12 mission conferences, and 14 missions. The official statistics for the year from Dec. 1, 1900, to Nov. 30, 1901, furnish the following summary: Number of ministers in full connection and on trial, 17,879; of local preachers, 14,092; of lay members and probationers, 2,948,137; of Sunday-schools, 32,126, with 349,277 officers and teachers and 2,708,469 pupils; of churches, 27,574, having a probable value of \$120,616,850; of parsonages, 11,474, valued at \$19,592,025.

The valuation of the Book Concern in 1901 gives, for the New York plant, \$1,656,201; for the Western plant, \$1,339,906. Besides the main establishments in New York and Cincinnati, there are four depositories connected with the New York house and two with the Cincinnati house. The total amount of sales reported for the four years ending in 1900 was \$7,858,034. Thirty-six official periodicals were published, in the English, German, and Swedish languages.

Church Extension.—The General Committee of Church Extension met at Columbus, Ohio, Nov. 6. The receipts for the year had been \$229,298 on the General fund and \$324,185 on the Loan and Annuity funds, the total, \$553,483, showing a net increase for the year of \$43,649. The entire capital of the Loan fund, \$1,189,571, together with the amount which had been returned by borrowing churches, gave, as the aggregate available for use by loans to date, \$2,744,845. Three hundred and forty-one churches had been aided during the year, making the whole number aided from the beginning 12,018. The total net receipts since 1865 had been \$7,371,711. The work of aiding frontier churches by supplementing special gifts of \$250 had been largely extended, and by this means about 700 churches had been made possible. The operations of the society had been extended to Porto Rico and the Philippine Islands. In fulfillment of a call for \$1,000,000 for Twentieth Century thank-offerings, the board had received \$235,832 for the erection of new churches, and \$362,776 for the payment of debts upon churches. The sum of \$345,375 was asked from the conferences for the ensuing year.

Board of Education.—The Board of Education had received \$129,137, and had aided 1,668 students, with loans amounting to \$80,108. From its institution in 1866 to July 1, 1901, it had aided 11,036 students with loans aggregating \$1,075,938. The 194 educational institutions of different kinds and grades returned in all 2,914 professors and teachers, 46,461 students, \$17,050,175 of property and \$16,165,654 of endowments, \$11,950,442 of which were productive.

Sunday-School Union.—The income of the Sunday-School Union for 1900 was \$21,727, and the expenditures were \$19,896, of which about \$4,545 were to missions in foreign countries.

Tract Society.—The Tract Society received for the year ending Nov. 30, 1900, \$19,522, and expended \$18,923. It circulates tracts throughout the United States and in the foreign mission fields, having a list of 1,400 tracts in 14 languages and dialects. It also publishes a weekly periodical—Good Tidings. Four tracts were added to its list in 1900.

Epworth League.—The enrolment of the Epworth League for 1901 included 21,000 regular and 7,600 junior chapters, with 1,900,000 members. The General Convention was held in San Francisco, Cal., and was attended by more than 20,000 delegates. Resolutions were adopted recording a deepening interest among the members and ap-

proving of measures which had been devised by the direction for a "forward movement" of great campaign on behalf of missions and other enterprises, and of plans for Epworth League extension providing for the systematic training of the young people in Christian work.

Freedman's Aid Society. The thirty-fifth annual meeting of the General Committee of the Freedman's Aid and Southern Education Society was held in Allegheny, Pa., Nov. 11 and 12. The treasurer reported that the entire receipts had been \$379,496, and that the amount derived from conference collections, \$110,646, was nearly \$2,500 in advance of that contributed in the previous year. The debt of \$154,479 standing at the close of the preceding year had been decreased by \$19,000, in addition to which \$23,960 had been received on the annuity plan and invested for the payment of the debt; and nearly \$12,000 more were available in subscriptions, bequests, and annuities, all of which would suffice to bring the debt under \$100,000.

The schools had been attended by 10,297 pupils. Nearly 3,000 students had received training in the industrial departments. The students had paid on account of tuition, board, room rent, and incidentals, \$113,237 toward their education.

Unusually large sums had been collected for new buildings and improvements. Thirteen important buildings were being completed, four of which would be available for school work by Jan. 1.

General Missionary Society.—The annual meeting of the General Missionary Committee was held in Pittsburg, Pa., Nov. 13 to 19. The receipts for the year were shown by the treasurer's report to have been \$1,233,186, and the expenditures for all purposes had been \$1,279,930. In addition to the regular income, \$111,705 had been received in special gifts and \$14,160, the addition of which would make the total amount received \$1,359,051, showing an increase for the year of \$39,123.

Appropriations were made for the coming year on the basis of the amount of the regular contributions of the past year (\$1,233,186), as follows: For foreign missions, in Europe, South America, Mexico, Africa, China, Japan, Korea, India, and Malaysia, \$578,232; for missions in the United States, including conference missions, the mountain region, the Pacific coast, white work in the South, colored work, mostly in the South, non-English speaking peoples (12 nationalities), and special appropriations for cities, \$436,210; miscellaneous appropriations (including \$46,744 for debt), \$218,744. A resolution was adopted, reciting that whereas open doors were inviting missionary labor in all parts of the world as never before; and whereas, notwithstanding increased collections from the churches, and by reason of the indebtedness accumulating from large successes, instead of embracing these opportunities, it had been necessary to reduce all appropriations about 8 per cent. below the inadequate appropriations made for the previous year, and the committee had been unable for years, for lack of funds, to make appropriations for the improvement of mission property in foreign countries or for the removal of debts from it; an increase of missionary contributions be asked from the Church, so that at least \$1,500,000 could be secured from collections only in 1892. The Board of Managers was authorized to employ such additional secretaries as might be necessary for the furtherance of this appeal, and was advised to constitute a special committee, to be called the Open Door Emergency Committee, to have such powers and functions in relation to increasing the missionary collections as it might from time to time prescribe.

Besides the domestic, South American, and European missions, the missions to heathen lands included 536 missionaries, 1,599 native preachers, 52,791 members, and 91,804 probationers.

Woman's Societies.—The Woman's Home Missionary Society held its twentieth annual meeting in the city of New York, Nov. 6. The report of the treasurer showed that the receipts for the year had been \$234,246. It maintained educational and industrial enterprises in the South, in missions among foreign populations, and in Utah and Alaska, deaconesses training-schools and rest-houses, and 2 city mission houses. Three hundred and fifty deaconesses were at work.

The thirty-second annual meeting of the Executive Committee of the Woman's Foreign Missionary Society was held in Philadelphia, Pa., Oct. 30 to Nov. 6. The total receipts for the year had been \$426,000, being an advance of \$12,000 over the year. The society had pledged itself three years before to raise \$200,000 as a Twentieth Century offering, to be applied to the erection of buildings, the purchase of land, and endowments. The sum of \$226,260 had been raised on this pledge, besides which the Folts Mission Institute, at Herkimer, N. Y., had been presented to the society, with an endowment making the whole value of the gift \$175,000, and the total amount raised on Twentieth Century account \$401,260. A room in the sanitarium at Clifton Springs, N. Y., had been presented to the society as a memorial of the late Dr. Henry Foster. The society's agents were laboring in Japan, Korea, China, Malaysia, India, Burma, Bulgaria, Italy, South America, Mexico, the Philippine Islands, and the Loochoo Islands. Twenty-two missionaries had been sent out during the year, 17 had come home for rest, 25 had gone back to the field after rest, and 21 new missionaries had been or were accepted. Two hundred and forty-three missionaries were now in service.

II. Methodist Episcopal Church, South.—The Year-Book of this Church for 1901 gives statistics, of which the following is a summary: Number of bishops, 11; of annual conferences, 48; of traveling preachers, 6,227; of local preachers, 5,151; of members, 1,470,520; of Sunday-schools, 13,903, with 101,399 officers and teachers and 853,751 pupils; of Epworth Leagues, 3,399, with 120,236 members; of educational institutions, 77, with 11,983 students, and buildings and endowments valued at \$7,522,583. Receipts for benevolent enterprises: Of the Missionary Society, \$346,079; of the Woman's Foreign Missionary Society, \$82,719; of the Church Extension Society, \$110,000. The publishing house returned its assets at \$947,686. Four connectional periodicals and 9 Sunday-school periodicals were published.

The fifty-fifth annual meeting of the Board of Missions was held in Nashville, Tenn., June 13-15. The report showed an increase of \$19,330 in the collections of the year over those of the preceding year, besides which \$11,707 had been contributed for famine relief in India. Several bequests had been received for special objects and enterprises under the care of the board. It was represented that an increasing interest in missionary work was manifested in the Church.

The missions in China, Japan, Brazil, Mexico, Korea, and Cuba returned for the year 1900-1901 139 missionaries, including wives, 257 native helpers, preachers, etc., 10,959 members, showing an increase for the year of 856; 10,346 members of Sunday-schools; 2,645 members of Epworth Leagues; and 16 self-supporting churches, with a total valuation of property of \$497,308.

The missions of the Woman's Foreign Mission-

ary Society in the same countries, with the addition of the Indian Territory, returned 52 missionaries, 164 teachers and native helpers, 4,736 pupils in schools, of whom 445 were Christians, 65 Bible women, and \$400,500 of property. The valuation of property includes that of the Scarritt Bible and Training School, Kansas City, Mo., \$75,000.

The annual meeting of the Woman's Home Mission Board was held in St. Louis, Mo., May 3. Reports were presented showing that 112 parsonages had been helped by the board and the conference societies during the year, at a cost of nearly \$12,000. Appropriations were made for 3 Cuban schools—at Key West, West Tampa, and Ybor City—of \$5,314, providing for a superintendent and 12 missionaries and teachers; of \$1,800 for night-schools among the Chinese and Japanese at 5 cities on the Pacific coast; of \$3,600 for rescue work at Dallas, Texas; of \$300 to open a night-school in the mining region of the Holsten Conference; and of “\$2,000 and fees” to the Sue Bennett Memorial School, Louisville, Ky. City mission work was carried on in 12 cities. In this work the local city mission boards are systematically aided by the appropriation to each of one-tenth as much money as it raised for local work during the preceding year. Steps were taken toward placing a teacher of home mission work in the Scarritt Bible and Training School, toward which \$750 were contingently appropriated. Toward \$25,000 called for for a Twentieth Century offering more than \$21,000 had been paid in cash. The sum was divided in appropriations among the different objects of Cuban work, mountain work, rescue work, and Pacific work.

The annual meeting of the Woman's Board of Foreign Missions was held in Asheville, N. C., in June. The contributions for the year had been \$82,719 for the regular work and \$40,000 special for the Twentieth Century fund. The regular work of the board included 29 mission stations, 55 missionaries, 164 teachers and native helpers, 65 Bible women, 18 boarding-schools, and 62 day-schools, with 4,736 pupils, 445 of whom were Christians, 19 buildings owned by the board and valued at \$336,500, 2 hospitals, and 2 Bible colleges. The board further owns in the United States the Scarritt Bible and Training School at Kansas City, Mo.

A general conference of missions was held in New Orleans, La., April 24 to 30, and was attended by about 2,000 delegates and visitors, who represented every part of the Church. Each of the several days of the conference was devoted to the discussion of a designated group of topics. The meetings were opened with an address on The Purpose of the Conference, by the Rev. James Atkins, D. D., after which the subject of the first day's sessions, The Spiritual Basis of Missions, was discussed in a number of addresses presenting various aspects and relations of it. The second day was given to Foreign Missions, when Bishop E. R. Hendrix spoke on The Adequacy of Christianity to meet the World's Need; the Rev. Dr. J. H. Pritchett, on Methodism and Modern Missions; the Rev. Dr. Brown, on The Aim and Scope of Foreign Missions; the Rev. J. W. Tarboux, of Brazil, on Evangelistic Work; the Rev. W. E. Edwards, D. D., on the Missionary Leadership of the Pastor; the Rev. Dr. J. F. Goucher, on Missions and Education; the Rev. Dr. Young J. Allen, of China, on The Missionary Outlook in the Far East; and the Rev. Dr. W. H. Park, on Medical Missions. The subject on the third day was Home Missions. The addresses were on Present Policy and Administration, by the Rev. Dr. D. C. Kelley; Problems of Self-Support and Adminis-

tration, by the Rev. Horace Bishop, D. D.; Trained Workers to Supplement our Regular Church Agencies in City Missions, by the Rev. Dr. W. H. La Prade; Growth and Character of City Population in the South, by Prof. G. W. Dyer; Need of Trained Workers, by the Rev. Dr. J. C. Morris; and other papers. A discussion of the negro question at the afternoon session was marked by addresses on Are we Meeting our Responsibilities to the Negroes of the South? by the Rev. R. J. Bingham; The Medical Education of the Negro, by G. W. Hubbard, D. D.; and The Industrial Education of the Negro, by Prof. Booker T. Washington, of Tuskegee Industrial Institute. The fourth day was Woman's Day. The addresses included The Aim and Scope of Woman's Work in Foreign Missions, by Mrs. S. C. Truehart; Woman's Educational Work, by Miss M. L. Gibson; Bible Women's Work, by Mrs. M. I. Lambuth; Medical Work, by Mrs. A. W. Feam, M. D., of Soochow, China; The Work of the Home Mission Society, by Miss Belle Bennett; The Literature of Home Missions, by Mrs. J. D. Hammond; Our Foreign and Factory Population, by Mrs. Florence Kelly; English and American Social Settlements, by Miss Jane Addams, of Hull House Settlement, Chicago, Ill.; and Woman's Work at Home and Abroad, by Bishop J. M. Thoburn, of the Methodist Episcopal Church. The fifth day was Young People's Day. Addresses were made on The Young People and the Church of the Future, by the Rev. Dr. James Atkins; Missionary Training and Literature for our Young People, by Miss Belle M. Brain; The Study of Missions by College Students, by the Rev. A. C. Millar, D. D., and the Rev. F. P. Turner; and topics relating to the Epworth League and Sunday-schools.

At one of the evening meetings a collection was taken for Soochow University, China, and more than \$50,000 were subscribed. The sum of \$3,500 was also raised as a "Laura Haygood Memorial fund."

III. African Methodist Episcopal Church.—The seventeenth annual meeting of the Board of Education was held in Memphis, Tenn., May 8, Bishop Benjamin F. Lee presiding. The report of the secretary showed that the year's collections had amounted to \$115,004, of which \$28,958 were derived from the collections of endowment day and the board's share (8 per cent.) of the "dollar money," and \$86,046 from collections by schools. The total amount of the collections for the sixteen years since the organization of the educational department was given at \$1,600,000. The meeting was addressed by Gen. George B. Gordon, superintendent of schools for Greater Memphis.

The books of the Sunday-school Union for 1900 were balanced at \$22,901 receipts and expenditures. A debt against the institution of \$5,392 had been reduced to \$1,500.

The Woman's Mite Society received during the year \$2,190, besides \$33 contributed for a school-house in South Africa, and expended \$1,347. Of the sum received, it sent \$275 quarterly, or \$1,100 for the year, to the missionaries in Sierra Leone, Africa.

The remains of Richard Allen, the founder and first bishop of this Church, who died March 24, 1831, which had lain since his death on the site in Philadelphia, Pa., where the society was organized, were reinterred, April 24, with appropriate ceremonies, in a white marble tomb specially constructed for their reception, in the new Bethel Church, standing on the same spot.

IV. African Methodist Episcopal Zion Church.—The general statistician of this Church,

the Rev. Dr. J. H. Anderson, published, July 4, 1901, the following summary of the financial activities from May 31, 1899, to May 31, 1900: Raised for the General fund, \$3,370; for the Education department, \$73,380; for the publication department, \$1,950; for the Varick Christian Endeavor department, general and local, \$5,197; for the Memorial Building, \$1,306; for the Woman's Home and Foreign Mission Societies, \$2,151; for the Book Concern (now absorbed in the publication department), \$1,214; or centennial offerings, \$7,869; for local benevolences, \$50,861; for pastors' salaries, \$3,177,000; for presiding elders' salaries, \$70,968; for current expenses, \$914,800; for purchasing new property and paying church debts and for repairs and for parsonages, \$3,763,996; for general missionary purposes, \$3,286; for church extension, \$2,103; for expenses of the General Conference (1900), including fares of delegates, \$3,500; miscellaneous, \$8,900; total contributions and receipts, \$8,210,286.

A Woman's Home and Foreign Missionary Society of this Church has been formed, and held its first convention during the summer at Atlantic City, N. J.

V. Colored Methodist Episcopal Church.—The General Board met at Liberty Station, Tenn., May 1, Bishop J. A. Beebe presiding. The publishing agent reported that the Christian Index, the official journal of the Church, was yielding a handsome profit after paying its own way; that the sale of Sunday-school literature had increased; and that the value of the publishing house, including machinery and stock, was more than \$20,000. The establishment was doing more general job work for the Church than ever before. An additional parcel of land had been bought for it, to meet the demands of increasing business. The general financial report showed that \$26,923 had been received for the general funds, and \$19,350 for the Twentieth Century fund.

VI. Methodist Protestant Church.—The statistics of this Church for 1901 give it 647 ministers, 1,135 unstationed ministers and preachers, 184,097 members, 2,401 churches, 534 parsonages, church property valued at \$4,754,721, 2,034 Sunday-schools, with 16,680 officers and teachers and 126,031 pupils, and 753 Christian Endeavor Societies, with 27,800 members. The foreign mission, in Japan, returned 3 central stations, 26 circuits, stations, and outlying missions, 21 missionaries, 32 native preachers and workers, 1 college, 1 theological seminary, and 4 schools. The year's receipts of the Board of Home Missions were returned at its annual meeting, May 8, as having been \$8,578. Out of the receipts, \$5,212 had been paid directly into the work of supporting missionaries and aiding in the maintenance of mission churches. All the missionaries had been paid in full, and no outstanding indebtedness remained due.

VII. American Wesleyan Church.—The following summary of the statistics of the American Wesleyan Church, representing all the conferences but three (Minnesota, Tennessee, and Willamette), was published in the American Wesleyan for Jan. 23, 1901: Whole number of elders on the conference rolls, 393; of superannuated ministers, 33; of quarterly conference licentiates, 304; amount contributed for preaching, \$61,093; for missionary enterprises, \$10,369; for educational purposes, \$1,694; for support of Sunday-schools, \$5,629; for the support of evangelists, \$8,639; on the "dollar plan," \$2,749; for superannuated ministers, \$861; for incidental expenses, \$8,626; for building and repairs, \$10,163; for other benevolent objects, \$3,815; number of members, 15,653; of Sunday-

schools, 471, with 465 superintendents, 1,948 teachers, and 17,290 pupils.

The five connexional boards met in their annual session at Syracuse, N. Y., June 11. The treasurer reported that the receipts of the societies for the year had been: Publishing Association, \$17,750; Missionary Society, \$2,929 for home missions and \$6,504 for foreign missions; Wesleyan Educational Society, \$4,833; Wesleyan Methodist Connection, \$12,409. The assets of the same societies were: Publishing Association, \$68,984; home missions, \$7,088; foreign missions, \$9,411; Educational Society, \$30,618; Wesleyan Methodist Connection, \$41,411; total "corrected," \$152,513; gain for the year, \$5,208. The Educational Society had closed the year out of debt and with a small surplus. Propositions were received for missionary work in Cuba, and the Executive Board were instructed to take the subject under advisement. An extension of the missionary work in Africa to the Limbah tribe was decided upon, and steps were taken toward sending out new missionaries.

VIII. Free Methodist Church.—The statistical tables published in connection with the combined annual minutes of all the conferences of this Church for 1901 give the following footings: Number of ministers, 891; of members, 25,678; of probationers, 3,180; of Sunday-schools, 1,095, with 36,476 pupils; of churches, 1,034, valued at \$1,115,340; of parsonages, 497, valued at \$332,435. Amount raised for foreign missions, \$11,032, of which \$8,459 were contributed by the Woman's Societies. The foreign mission fields returned 173 members and probationers. Amount raised for education, \$488; for ministerial support, \$255,327. Most of these numbers show an increase from the previous year. At the meeting of the Executive Committee of the Church, held in October, a committee appointed to confer with officers of labor organizations to make some arrangement whereby laboring men members of the Free Methodist Church might work unmolested in union shops without taking any oath or obligation in conflict with the discipline of the Church, reported that they had done as directed without success, and advised that this was no time to compromise or capitulate; and that both preachers and laymen, at whatever cost, should stand by the denominational principles as never before.

IX. Methodist Church in Canada.—The Methodist Church in Canada, with 11 conferences, including that of Japan and the China mission, returned for 1901, 1,787 ordained ministers, 229 probationers, 2,264 local preachers, 289,162 members, 3,419 Sunday-schools, with 32,642 officers and teachers and 266,423 pupils, 1,825 Epworth Leagues, with 70,988 members, 4,334 churches and places of worship, 1,133 parsonages, 19 colleges and educational institutions, and \$15,397,634 of church property. Book and publishing houses are established at Toronto, Halifax, and Montreal. The periodicals are 2 weekly journals, one magazine, Sunday-school publications, and the organ of the Epworth League. The income of the Missionary Society for the year 1900-1901 was \$270,312. It has 530 home and foreign mission stations, 496 missionaries, 95 assistants, 49 teachers, and 17 interpreters, with 47,236 members.

X. Wesleyan Methodist Church (Great Britain).—The statistical reports of this Church for 1901 give it, in Great Britain and Ireland, 2,492 ministers, 20,646 lay preachers, 520,354 church-members and probationers, 7,668 Sunday-schools, with 133,207 officers and teachers and 990,523 pupils, and 8,976 churches. The foreign missions returned 364 ministers, 1,999 lay preachers, 62,370

members, 1,231 Sunday-schools, with 4,103 officers and teachers and 66,974 pupils, and 2,404 churches. Of the affiliated conferences, the French had 37 ministers, 93 lay preachers, 1,702 church-members, 2,667 pupils in Sunday-schools, and 143 churches; South African Conference, 214 ministers, 3,676 lay preachers, 90,124 members, 38,118 Sunday scholars, and 826 churches; and the West Indian Conference, 92 ministers, 916 local preachers, 45,936 members, 28,750 Sunday scholars, and 431 churches. The report of the Metropolitan Chapel fund, presented at the annual meeting, May 2, showed that during the year 8 chapels had been opened to which grants had been made. Grants had also been sanctioned for improvements and extensions at Deptford and to the Leysian Mission, which proposed to expend £105,000.

The sixty-first annual report of the Wesleyan Methodist Committee on Education, issued in March, 1901, gives the whole number of scholars on the books as 160,787, with an average attendance of 129,905. The actual income of the schools, including Government grants, was £284,991, showing an increase of £12,833. The total expenditure had been £295,781, showing an increase of £12,491.

The Rev. Dr. Waller, secretary of the Education Committee, presenting his statement at the annual meeting, March 27, gave a historical survey of the contributions Methodism had made, by its training-colleges and elementary schools, to the advance made in national education during the reign of Queen Victoria. He claimed that as Wesleyans they had put £1,225,000 into their schools, the annual income from which now exceeded £250,000. They were expecting to receive £200,000 from the Twentieth Century fund for educational work, and a part of this would go toward providing an additional training-college somewhere in the north of England.

The Chapel Committee reported to the Conference that sanction had been given to the erection of 91 chapels, costing £196,276; of 29 ministers' houses, costing £25,764; of 20 school-rooms, costing £11,574; and to 131 alterations and enlargements, costing £73,714. The proposed new chapels would provide additional accommodation for 14,787 sittings, some of the new buildings superseding former buildings; and the new chapels already completed provided 11,453 new sittings.

The annual meeting of the Wesleyan Missionary Society was held in London, April 29. Mr. James E. Vanner presided. The income of the year from all sources on current account had been £135,494, and the expenditure £136,466. A statement of the work of the society in all parts of the world, submitted by the general secretaries, represented that since the transference of the German missions to the Methodist Episcopal Church in the United States, the operations of the society in Europe had been among the Latin races, where a spirit of independence in religious thought seemed to be growing. Official visits paid by the Rev. W. H. Findlay to the west coast of Africa and Dr. Waller to the Bahamas had been attended by beneficial results. In the Transvaal, the society's agents were returning as fast as the military authorities permitted them. In China the agents of the society had thus far been spared the fate which had befallen those of several of its sister societies, with which the report expressed sympathy.

The Conference met in its one hundred and fifty-eighth annual session at Newcastle-on-Tyne, July 23, the representative session for the first time meeting, under the new rule, before the pastoral

session. The Rev. Theophilus Davison was chosen president, and delivered at his induction an address on the relation of the Church and the world at the present time, especially the position of Methodism at the opening of the new century in relation to that strong current of secular thought and feeling which was mightily moving the generation. Steady progress was reported to have been made during the year toward the completion of the Twentieth Century fund of 1,000,000 guineas. There now stood to the credit of the fund £657,000, an increase of £354,000 on the receipts reported at the previous Conference. Neither circuit nor connectional funds had suffered during the progress of the fund, but had rather prospered. The committee were of the opinion that after making adequate allowance for failures to fulfil promises, the addition of 100,000 guineas to what was already subscribed would carry the fund to a triumphant issue, and it would be possible to hand over to the various objects the sums allocated. The Conference directed that renewed efforts should be made in every circuit to secure the speedy payment of existing promises, and obtain additional ones, and that except a public collection in all chapels and schools, appeals for subscriptions to the fund should terminate at the end of the year. The Foreign Missions Committee reported that the income for 1900 had been £136,466, and that a balance of £972 was to be carried forward to the account for 1901. The importance of the secretary in charge visiting the South African missions was urged. The Conference was visited by a deputation from the Northern Christian Union, an association of the various Christian churches for closer union which was formed during the meeting of the Church Congress in Newcastle in 1900. The Bishop of Newcastle, who was not able to attend with the deputation, sent a letter of greeting. A message of sympathy in his illness was sent to the Bishop of Durham. Its receipt was acknowledged on behalf of the bishop, who, it was said, had been much touched and cheered by it; and on the death of the bishop a deputation was appointed, by agreement with his friends, to attend his funeral. A minute was adopted to the effect that the most strenuous opposition should be offered to any change in the declaration against Roman Catholicism in the coronation oath which would weaken the guarantees of the Protestant succession. The Conference declared its disapproval of any policy which would tend to weaken the direct popular control of primary education, or to imperil the work of the school board. The question of establishing certain or all Wesleyan proprietary schools on a more strictly connectional basis was referred to the Education Committee. A misunderstanding having occurred with reference to some Primitive Methodist students attending the Wesleyan training-colleges, the Conference resolved unanimously that after provision had been made in the colleges for Wesleyan candidates, members of other Methodist churches might be properly welcomed on condition that they were prepared to attend the appointed religious services connected with the institutions, with the distinct understanding that their own denominational relations should not be compromised. A report on open-air preaching recommended that the circuits arrange, wherever practicable, for the more efficient carrying on of that branch of church work, and that increased attention be given to the subject in the ministerial colleges. While the educational standard of candidates for ministerial training was considered in the representative conference, and the committee on the

subject was reappointed, a resolution was unanimously passed in the pastoral session that, "while recognizing that only those who are called by God can rightly and truly discharge the office of Christian ministry, at the same time the Conference is convinced of the extreme importance of securing candidates of higher intellectual and educational fitness," and the subject was referred to a special committee. Attention was called in both sessions to the serious character of the questions suggested by a decrease in the number of pupils in Sunday-schools. The report of the Committee on Baptized Children was remanded to the synods and the committee was enlarged. The conference decided that the new hymn-book be constructed as a unity to cover the whole ground of Wesleyan Methodist worship, doctrine, and experience, and that its title be simply *The Methodist Hymn-Book*. A Hymn-Book Selection Committee was provided for to consist of ministers and laymen. Some other Methodist denominations having expressed an interest in the work, places on the committee were provided for their representatives, and a general invitation was given to other Methodists to cooperate.

XI. Primitive Methodist Church.—The statistical reports of this connection, presented to the Conference in June, showed that it had 1,100 ministers and 198,874 members, 59,929 teachers and 460,783 pupils in Sunday-schools, and 4,575 chapels providing sittings for 1,042,335 hearers and valued at more than £4,000,000. The profits of the book-room had amounted to £5,057, of which £3,500 were devoted to the Superannuated Ministers' Widows' and Orphans' fund. The Connectional fund returned an income of £7,285. An increase of 19 Sunday-schools was reported, with 131 pupils. The contributions of the Sunday-schools amounted to £70,544. The Bible and Prayer Union returned 1,354 branches and 58,906 members. Gains had been made of 201 Christian Endeavor Societies and 5,405 members, the present number of societies being 1,429. The Chapel Aid Association and the General Chapel fund reported progress in the reduction of chapel debts. The Chapel Loan fund had increased to more than £12,000. The Church Extension fund had completed the first year of its history with an income of £4,627, and had rendered help in new projects involving an outlay of £65,000. The Superannuated Ministers' Widows' and Orphans' fund maintained 310 annuitants and 4 orphans. Reports were made of Manchester College, of the examination of ministerial candidates, and of the literary institutions.

The annual meeting of the Primitive Methodist Missionary Society was held in London, May 20 and 21. Owing to a change in the date of audit, the reports were for nine months. The income of the General fund during that period had been £8,657, and the outgo £8,433. The total receipts of the African funds had been £8,214, including the former balance, and the expenditure had been £3,425. An increase of 129 members was returned in the home mission stations. The foreign stations were in Africa—4 on the island of Fernando Po, 2 in the Niger Protectorate, 1 in Cape Colony, and 3 in Central Africa. All showed progress. The mission at Aliwal North was recovering from the effects of the war.

The eighty-second Primitive Methodist Conference met at Sheffield, June 12. The Rev. H. B. Kendall was chosen president. A committee was appointed to prepare for the consideration of the next conference a plan for a corporation to hold connectional properties that do not come within the provisions of the Chapel Model Deed. Legal

difficulties having arisen in Australia respecting the transfer of properties in consequence of Methodist union in that country, a committee was appointed with plenary powers to settle the question. Resolutions were passed declaring the education bill before Parliament mischievous, demanding public control for all schools supported by public funds; insisting that all branches of education should be under the control of public bodies elected for that purpose; and demanding that training-colleges should be freed from sectarian tests. It was decided that ministerial invitations can not be given more than twelve months previous to the Conference at which they will come up for ratification. The question of setting apart ministers as connectional missionaries was referred to a committee for consideration.

XII. Methodist New Connection.—The one hundred and fifth Conference of the Methodist New Connection met at Hanley, June 12. The Rev. G. T. Candlin was chosen president. A memorial asking that more time be given to the purely spiritual aspects of the Christian life and work of the Connection was answered by a provision of devotional addresses at the opening exercises of part of the morning sessions. Progress was reported in raising the Extension fund of £10,000 which the Conference had undertaken to secure, £4,690 having been promised and partly paid. In order to expedite contributions the Conference resolved to send special deputations to canvass all the circuits. A report was made of negotiations with the Wesleyan Book Committee, respecting the preparation of a common hymnal for all the Methodist Churches. The college for the training of ministers and the Worn-out Ministers' and Widows' Society were subjects of amendatory legislation. A resolution with reference to the South African War included a passage urging the people of the Connection "to watch and guard against the military spirit, and to labor more strenuously than ever for the time when disputes between nations shall be determined without recourse to arms, by arbitration or other pacific measures."

XIII. United Methodist Free Churches.—The following is the summary of the statistics of these churches as reported to the Annual Assembly at Redruth in July: In the home districts—number of ministers, 356; of local preachers, 3,022; of leaders, 2,913; of members, 72,568, with 6,474 on trial; of chapels, 1,264, and 62 preaching rooms; of Sunday-schools, 1,227, with 23,665 teachers and 185,448 pupils. The foreign stations returned 49 missionaries and 10,555 members, making the total membership 83,123. The total cost of chapels, schools, ministers' houses, etc., was £2,248,416, and the liabilities were about one-sixth of the original cost. The churches provided sitting accommodations for 381,872 persons, and the total attendance at the services March 24, 1901, was 264,353.

The Annual Assembly met at Redruth, July 9. The Rev. David Brook was chosen president. Reports were made of the Chapel Relief fund, the income of which had been £798, while grants of £375 had been made and of £545 promised conditionally; the Benevolent and Superannuation fund, receipts £9,270 and expenditures about the same; the book-room, which had realized a profit of £360; the Fire Insurance Association, which was continuing to make steady progress; the Loan fund, which had a capital of £13,810, £10,981 of which were out on loan; and home and foreign missions, the income for which had been £15,747, and which returned a balance in hand of £738. The report of the Twentieth Century

fund showed that the 100,000 guineas which had been aimed at had been exceeded, the total sum of £109,829 having been promised, and £43,828 paid in. Of this total the foreign mission stations had contributed 1,476 guineas. Of the total amount received £19,305 had been paid to local objects and £2,000 to the London Chapel Extension fund. A request from one of the circuits for permission, in case they should fail to find an acceptable minister in the ranks of Free Methodism, to choose one from the Congregational, Baptist, or Presbyterian denominations, gave rise to discussion. It was opposed as not being in accord with the connectional principles, and because to grant it would establish a dangerous precedent. It being shown that the original compact of union made it incumbent that a Free Methodist minister should be appointed, the Conference decided to adhere to this rule. A favorable report was made of the Young People's Societies. Thirty sisters were returned as connected with the Deaconesses' Home.

The annual meeting for the missions was held in London, April 23, Alderman Hart, of Birmingham, presiding. The report represented that the Mendi Mission in West Africa had been partly reestablished. In China the lives of the missionaries had been preserved. A hospital and a church had been erected at Ning-po, and the membership had increased considerably at Ning-po and Wen-Chau. At home only 5,000 of the 100,000 guineas aimed at by the Twentieth Century fund had still to be raised. The minimum salary of the ministers had been increased from £100 to £110. The church-membership at home was now 72,085, with 1,968 juniors and 4,639 on probation; and abroad it was 10,889 (3,194 being in Africa, 3,217 in Jamaica, and 1,978 in Australia), with 397 juniors and 4,054 on probation. A small net decrease of members was met by about an equal increase of probationers. The missionary income had been £16,265, besides £3,833 which had been raised and expended abroad, but a deficit of £1,283 remained.

XIV. Wesleyan Reform Union.—The fifty-third annual Conference in connection with the Methodist Reform Union met in Bradford, Aug. 3. The Rev. William Clough was chosen president. The statistical report showed an increase of 185 church-members, with 768 on trial, and a total of 7,049 members. An increase of 423 appeared also in the number of Sunday-school pupils. The treasurer of the Jubilee fund reported that £1,500 had been raised toward that object, and it was decided to keep the fund open till £2,000 were reached. The committee on the new hymnal, after having been engaged for three years in preparing a book, had their work so well advanced that tenders had been asked for the printing of it, when it was found that a desire long held by the union for a joint or united hymnal for Methodists generally had come within the bounds of possibility, the Conference having been invited to appoint a representative to act with the Wesleyan Hymn-Book Committee in the compilation of such a book. This was agreed to.

XV. Bible Christian Church.—The Bible Christian Conference met at Plymouth, July 31. The Rev. John Luke was chosen president. The report of the New Century fund showed that £20,125 had been promised on its account, and £13,366 paid. A scheme for the better education of ministerial candidates which was approved by the Conference comprises the taking of a house near some university or college, at the classes of which students may attend, with the appointment of a suitable minister to reside with the students and direct their studies, acting especially as a

theological tutor. Important amendments were made to the system of connexional finance. The missionary report showed an increase in membership, while the money receipts, £5,110, were nearly £200 less than in the previous year. The debt had increased, and now stood at £1,827. The book steward's report showed a reduced profit.

XVI. Independent Methodist Churches.—The statistics of these churches in England give them 146 chapels, 7 missions, 8,377 members, 372 ministers, 144 Sunday-schools with 26,194 pupils and 2,905 teachers and officers, and church property valued at £118,177, subject to debts of £36,768. The Conference met at Leigh in June, Mr. J. Crumbleholme presiding. It was resolved that as one of the fundamental principles of the constitution was that there should be no distinction between clergy and laity, the title Reverend should be kept out of the record. The churches were advised to recognize as members young people of approved character and sixteen years of age who are active members of the Christian Endeavor Society. The affairs of the Ministers' Assistance fund were considered. Toward the New Century fund of £5,000, £3,200 had been promised and £2,500 had been paid. The office of vice-president was abolished.

XVII. Australasian Wesleyan Methodist Church.—The statistical returns of this Church, reported to the General Conference in May, gave the following numbers: Of ministers, 719 in full connection and 83 on probation; of local preachers, 6,661; of class-leaders, 7,807; of church-members, 108,136, with 10,626 on trial and 18,953 junior members of society; of teachers in Sunday-schools, 21,476; of pupils in the same, 211,082; of churches, 3,389, with 2,150 other preaching places and 485 schoolrooms; of persons ministered to by class-leaders, 556,337.

The General Conference met in Brisbane, May 17. The retiring president, the Rev. H. T. Burgess, D.D., opened the proceedings with an address in which he referred to the important events which had happened to Australia and the British Empire since the preceding General Conference, and considered the opportunities which were opening before the Methodist Church and its duties in view of them. He declared that the question of the union of all the Australasian branches of the Methodist Church, started in the General Conference in Adelaide seven years before, was settled. In four of the six conferences union was actually effected; in the others it was decided upon; in the next year it would be complete, and the Methodist Church of Australia would be one in fact, in spirit, and in name. The Rev. George Lane was chosen president of the present General Conference. Much attention was devoted to the concerns of the missions. The taking over of the mission of the former Bible Christian Church of South Australia in China was approved of, and the reopening of the mission, which had been closed on account of the disturbances, was directed. The new constitution proposed by the Board of Missions for the Fijian synods was considered and adopted. The Mission Board was authorized to approach the Fijian Government on the subject of making more adequate provision for the higher education of the people and of securing the attachment of just conditions to any aid offered. It was directed to make suitable provisions for the prosecution of the coolie mission in Fiji, and it was advised to open a mission in the Solomon Islands as soon as practicable. A proposition was approved for the appointment of medical or other specially qualified missionaries ordained for foreign work only, with the proviso

that they should have no claim for circuits on their return to home work, and no claims on the connexional funds. The further working out of this plan was left with a special committee. Unauthorized special appeals for matters of foreign mission work were discouraged. The trustees of the Children's fund reported that 428 mothers and widows were claimants upon them for 1,215 children. An allowance of £8 10s. was made for each child, except in West Australia, where the amount was £9. A thankful acknowledgment was made for the establishment, under the Crown of Great Britain, of the Commonwealth of Australia; and satisfaction was expressed "that at the formal inauguration of the commonwealth and the opening of the Federal Parliament, the Divine blessing upon these national events was reverently invoked," with the hope that the two houses would enact that their daily sessions shall be opened with prayer. The question of the rights of the several churches in the matter of precedence on occasions of public ceremonial having been raised in connection with the proceedings at the inauguration of the commonwealth, a declaration was adopted, that, "whereas under the Constitution of the Commonwealth of Australia the principles of religious freedom are asserted or implied, and whereas under that Constitution all the churches of the commonwealth necessarily possess equality of rights and privileges, the General Conference therefore claims that in all matters in which official recognition is extended to the churches in their representatives, the principle of religious equality shall be observed, and precedence be accorded only on the ground of the numerical position of the churches, apart altogether from any titles or designations by which the heads thereof may be known. The Conference also claims that in relation to the appointment of chaplains in the defense forces or to public institutions of the commonwealth, the same principle shall be recognized and acted upon." The Conference insisted that no alteration in the form of the coronation oath would be acceptable which should relax in any degree the safeguards which insure the Protestant succession to the throne. The Premier was requested to take steps to secure the safeguarding of missionary and British interests generally in the New Hebrides group. Committees were instituted to look after the interests of the Church in the military and naval administration of the commonwealth. The Conference approved of the preparation of a new hymn-book to be undertaken by the British Conference, of such character as to be suitable for all types of Methodism throughout the world. The 1st day of February, 1902, was appointed as the date when Australasian Methodist union shall be declared to be general, on which day the name of the Church will become legally the Australasian Methodist Church.

Methodist Ecumenical Conference.—The third Methodist Ecumenical Conference met in the City Road Chapel, London, Sept. 4. The Conference was composed of 479 delegates, of whom 200 were representatives of the Eastern, or British section, and 279 of the Western, or American section. The opening sermon was preached by Bishop Charles B. Galloway, of the Methodist Episcopal Church, South, on the subject of Christian Experience: Its Supreme Value and Crowned Evidence. A message of good-will invoking blessing on the deliberations of the Conference was received from the Archbishop of Canterbury. A message of greeting was received from the Bishop of London, and was referred to the Rev. Dr. T. Bowman Stephenson, president of the Wes-

leyan Conference, to reply to a clause it contained recalling John Wesley's attachment to the Church of England, and hoping that in the providence of God the Wesleyan Methodists might one day be reunited to the old Church. Addresses of welcome were delivered by the Rev. Dr. E. E. Jenkins, of the Wesleyan Church, the Rev. Joseph Odell, Primitive Methodist, and Sir Charles T. Skelton, New Connection Methodist, to which responses were made by Bishop J. F. Hurst, of the Methodist Episcopal Church; the Rev. Dr. John Potts, of the Methodist Church of Canada, who spoke of the beneficial effects of the union of the Methodist churches of the Dominion which had made them one from the Atlantic to the Pacific; and Bishop Walters, of the African Methodist Episcopal Zion Church, who spoke of the African Methodist Episcopal churches of America as numbering 27 bishops, 1,462,304 communicants, 1,821,468 pupils in Sunday-schools, and 5,000,000 adherents.

The subject of the second day's proceedings was The Present Position of Methodism in the World, and was treated in papers relating to the territory covered by the Eastern section; the state of the Methodist churches in Australia and the near completion of the union there; united Methodism in Ireland; the work of the Methodist churches in Africa; and The Present Position of Methodism in the Western Section. On the third day papers were read on The Influence of Methodism in the Promotion of International Peace, International Fellowship among Methodists, and The Relation of Methodism to the Evangelical Church Movement. The subjects of the discussions of the fourth day were Biblical Criticism and the Christian Faith, Recent Corroborations of the Scripture Narrative, and The Appeal of the Old Testament to the Life and Conscience of Today. Those of the fifth day were Principles of Protestantism *versus* Modern Sacerdotalism, and Methodism and Education in the Twentieth Century. The following resolution commending the movement for Methodist union was adopted:

"Resolved, 1. That this Ecumenical Conference rejoices in the abounding evidences of the essential unity which pervades the Methodist churches throughout the world, and records with devout thankfulness to the great head of the Church the accomplishment of the organic union of the several branches of Methodism in Australasia. The Conference confidently anticipates that the Methodist churches will yet see that such is the divine will, and will follow the example set by the Methodist churches in Canada and Australasia.

"2. That this Conference recommends the churches of the Eastern section taking into serious consideration that the time has come for, at all events, a partial union among themselves."

The discussions were resumed on the sixth day, with papers and addresses on Christianity and Modern Unbelief, Secularism and Christianity, and Modern Indifferentism, and on the seventh day upon Methodist Literature, New Demands for Methodist Authorship, and Methodist Journalism. Deputations bringing fraternal salutations were received from the National Council of Evangelical Free Churches, the United Free Church of Scotland, the Presbyterian Alliance, the Moravian Church, the Huguenot Congregation at Canterbury, and the Salvation Army. The proceedings of the seventh day included papers and addresses on the question, Is Methodism retaining its Spiritual Vitality? and The Neglect of Family Religion and Worship. The subjects for the ninth day were Practical Methods of Dealing with the Liquor Traffic and the Ethics of Gambling. On the tenth day, Sept. 14, after appropriate pro-

ceedings and the passage of resolutions with respect to the death of President McKinley, the Conference proceeded with the consideration of the subjects of The Perils of Increasing Wealth and Luxury, and on the eleventh day of Elements of Pulpit Effectiveness and How to Mobilize the Church. The twelfth day, the closing day of the Conference, was occupied with the discussion of the subjects of Missions, The Work before Us, and the Resources for the Work, after which a memorial service of President McKinley was held.

Propositions with reference to the preparation of a common Methodist hymn-book were referred to a committee which reported that while regarding the suggestion as a thing to be hoped for at some future day, in view of certain business arrangements which had been made and financial responsibilities incurred by some of the Methodist bodies, the plan was not at present practicable. A plan was adopted for the organization of the fourth Ecumenical Conference in 1911, which will be held within the bounds of the Western section and will consist of 500 delegates. Provision was made in this action for a full consideration of the work of foreign missions, evangelistic work in the great cities, and the work of Methodist women. An ecumenical address to Methodists throughout the world was read to the Conference and adopted.

A Young People's meeting was held, and the subjects of the Moral Unity of the English-speaking Races and Evangelistic Work in Great Cities were presented at public evening meetings.

A special meeting of the women attending the Conference as wives of delegates was held Sept. 13, at which a number of addresses were made, and the Conference was requested to make provision in the program for the fourth Ecumenical Conference for the presentation of "the work of the women of world-wide Methodism."

To the greeting of the Archbishop of Canterbury the following reply was adopted and sent:

"The Ecumenical Methodist Conference, representing more than 7,000,000 communicants, earnestly prays that you may yet be spared for many years to fulfil the duties of your great office, and that the blessing of Almighty God may abundantly rest upon the Reformed Church of England over which you preside.—I am, my Lord Archbishop, yours faithfully, T. Bowman Stephenson."

As the salutation of the Bishop of London to the Conference expressed a desire for the return of the Methodists to the Anglican communion, the following special reply was adopted, to be sent to him:

"MY LORD BISHOP: I am deputed by this Conference to reply on its behalf to your kind and courteous letter, dated Sept. 1. The historic connection of early Methodism with the Anglican Church and our obligations to the scholarship and saintship of your communion makes such a message of good-will very welcome to our hearts. Though the last thing we should wish is to make the reception of such a letter as yours an opportunity for controversy, the desire definitely expressed in your letter appears to require an answer as definite.

"The Conference represents the whole family of Methodist churches throughout the world. Differing in some non-essential points of church government, they are alike in creed, in the main principles of church organization, and in the accepted modes of Christian fellowship, and they are in full communion with each other. In some respects, therefore, the relation of this Confer-

ence to the Methodist churches is similar to that of the Pan-Anglican Synod to the Anglican churches. But the Conference differs from the Synod in the fact that it is composed of representative ministers and laity. It has no authority over the constituent churches, but affects them powerfully by its discussions, its tone and influence.

"From this you will see that your suggestion respecting a possible union of the Methodist with the Anglican Church raises vast and far-reaching issues. Of the many millions of Methodists represented here probably six-sevenths live in the United States and portions of the British Empire in which there is no establishment of religion by law. Of the remaining seventh a very large majority would not consent to part with the perfect independence now enjoyed by the churches to which they belong under the sole headship of Christ our Lord. You will see how powerfully this fact bears upon your suggestion.

"But a great and more permanent difficulty lies in the way. We are not aware that any constituted authority in the Church of England has expressed the willingness of that Church to recognize the validity of the ministry and sacraments which we possess and cherish. That being so, any consent of ours to a movement toward corporate union with the Anglican Church would be an acknowledgment of an invalidity and inferiority of our church order, which our convictions would not allow us to make.

"None the less do we appreciate the courtesy and kindness of your communication. We pray that God may richly bless the efforts of yourself and your brethren for the spiritual and social uplifting of the population of this country. We are ready to cooperate with our Anglican brethren in all good works so far as the beliefs and practices of your Church will allow, and we wish to maintain the traditional policy of the Methodist Church, expressed by Wesley himself in his famous phrase, 'We desire to be the friends of all and the enemies of none.'—I am, my dear Lord Bishop, yours very obediently,

"T. BOWMAN STEPHENSON."

A report on statistics of the world's Methodism embodied estimates that in the Western section there were 42,064 itinerant preachers, 46,884 local preachers, 6,437,361 church-members, 62,030 churches, the value of their church property was \$180,179,850, and they had 62,489 Sunday-schools, 582,929 teachers and officers, and 5,091,897 Sunday scholars. In the Eastern section 6,276 ministers, 58,413 local preachers, 27,077 churches, 1,221,824 members, 20,750 Sunday-schools, 273,415 leaders and officers, and 2,175,623 scholars. The totals in both sections were 48,334 ministers, 104,786 local preachers, 7,659,285 members, 61,228 Sunday-schools, 361,392 officers and teachers, and 7,077,079 scholars, showing increase in ten years of 5,131 ministers, 17,891 local preachers, 280 Sunday-schools, and 442,979 scholars, and a decrease of 17,825 teachers. Estimated whole number of adherents, 24,899,401; valuation of Church property in the Western section, \$180,000,000; in the Eastern section, \$120,000,000.

MEXICO, a federal republic in North America. The legislative power is vested in the Congress, consisting of a Senate of 56 members, 2 from each State and the Federal District, and a House of Representatives containing 227 members, 1 to 40,000 of population, the Representatives elected for two years, the Senators for four years, by the votes of all respectable adult male citizens. The term of the President is also four years. Gen.

Porfirio Diaz was elected President in 1876, and has been reelected five times, the last time on July 9, 1900. The Cabinet was composed in the beginning of 1901 as follows: Secretary of State, Gen. J. M. Gonzalez Cosio; for Foreign Affairs, I. Mariscal; for Finance, Gen. M. Gonzalez Cosio; for Justice and Instruction, J. Baranda; for Fomento, M. de la Cruz; for Communications and Public Works, Gen. F. Z. Mena; for War and Marine, Gen. Bernardo Reyes; Treasurer, F. Espinosa.

Area and Population.—The area of Mexico is 767,005 square miles, including islands with an area of 1,420 square miles. The population in 1895 was 12,491,573, having increased from 9,908,011 in 1879. The proportion of whites in 1895 was 19 per cent.; of mestizos, 43 per cent.; of pure Indians, 38 per cent. The foreign population was 50,888, of whom 11,331 were citizens of the United States. Mexico, the capital city, had 329,774 inhabitants. The number of marriages recorded in 1897 was 51,000; of births, 375,376; of deaths, 455,009. Registration, especially of births, is neglected, and in 1898 it was made a legal condition of the legitimacy of children.

Finances.—The revenue of the Federal Government for the year ending June 30, 1900, was \$64,261,078 in silver, including temporary loans and money raised on bonds for the payment of railroad subventions; and the expenditure was \$58,309,934. For the financial year 1901 the ordinary revenue was estimated at \$58,234,000, of which \$26,868,000 were import and export duties, \$23,132,000 internal taxes levied in the federal district and territories, \$3,067,000 receipts from public services, and \$1,499,000 receipts from the mint, assay-offices, and patents. The expenditure for 1901 was estimated at \$58,009,082, of which \$1,020,443 were required for the legislative, \$82,469 for the executive, and \$515,224 for the judicial power, \$586,043 for foreign affairs, \$4,328,879 for the interior, \$2,657,551 for the Department of Justice and Education, \$952,283 for agriculture and commerce, \$7,415,476 for public works, \$6,793,821 for finance, \$20,372,992 for the public debt and pensions, and \$13,283,901 for the army and navy. The revenue for the year ending June 30, 1902, was estimated at \$61,694,000, and expenditure at \$61,577,990. The receipts in 1901 exceeded the estimate by \$11,000,000. The foreign debt in 1900 amounted to £22,628,920 sterling. There were also \$140,000 of 6-per-cent. bonds outstanding payable in silver. The amount of the internal debt was \$114,542,648 on June 30, 1899, besides a floating debt of \$953,619.

The revenue of the states in 1898 amounted to the sum of \$18,930,608, and their expenditure to \$16,429,909. The revenue of municipalities was \$15,635,031, and expenditure \$15,381,670.

Commerce and Production.—The production of rice in 1898 was 20,718 tons; of beans, 5,264,269 hectoliters; of corn, 39,238,300 hectoliters; of wheat, 235,342 tons; of sugar, 66,761 tons; of panocha, 71,649 tons; of molasses, 65,206 tons; of spirits, 1,063,804 hectoliters; of henequen, 66,230 tons; of cotton, 44,794 tons; of logwood, 74,777 tons; of cacao, 1,341 tons; of coffee, 16,100 tons; of tobacco, 43,524 tons; of fermented liquors, 6,127,511 hectoliters. There were 1,693 mines in operation in 1898, of which 89 produced gold only, 373 gold and silver, 172 gold with other metals, 259 silver only, 168 silver and lead, 129 silver with other metals, 23 copper only, 7 copper and iron, 20 lead, 3 lead with zinc and iron, 17 iron, 41 antimony and cinnabar, 7 sulfur, tin, and graphite, and 385 were not developed. The ores raised in 1898 were valued at \$65,129,840. The number of workers in the mines was 89,000. The

quantity of gold brought to the assay-offices during the financial year 1898 was 5,712 kilograms, valued at \$3,858,269; of silver, 1,496,969 kilograms, valued at \$61,106,772. These figures do not include the precious metals intended for export, consisting of 5,041 kilograms of gold, value \$3,404,728, and 936,158 kilograms of silver, value \$41,707,635. There are 8 assay-offices and 3 mints, at which gold will be coined for anybody with a deduction of 4.62 per cent. and silver with a deduction of 4.41 per cent. There were 1,972 distilleries in 1898, producing 726,135 gallons of spirits. There were 118 cotton-mills, with 13,994 looms and 468,547 spindles, consuming 57,201,573 pounds of raw cotton, and producing 3,795,446 pounds of yarn and 9,875,764 pieces of cloth. The number of tobacco factories was 721, consuming 6,148,362 pounds of tobacco, and turning out 162,689,604 packets of cigarettes, 22,976,415 cigars, and 32,632,073 cheroots.

The total value of imports in the year ending June 30, 1900, was \$61,304,914 in gold. The exports were \$150,056,360 in silver, merchandise being valued at \$79,031,336 and precious metals at \$71,025,024. The exports of silver bullion were \$39,422,839; of silver coin, \$11,464,450; of silver ore, \$12,693,445; of gold, \$6,726,880; of coffee, \$10,898,678; of henequen, \$26,099,388; of woods, \$2,423,515; of hides and skins, \$4,142,368; of cattle, \$5,732,064; of tobacco, \$1,645,576; of ixtle, \$1,653,080; of zacaton root, \$994,238; of vanilla, \$1,281,436; of beans, \$580,655.

The commerce, inclusive of precious metals, was divided among the principal foreign countries in 1900 as follows, the value of imports being given in gold and of exports in silver:

COUNTRIES.	Imports.	Exports.
United states.....	\$31,030,136	\$116,098,456
Great Britain.....	10,479,512	12,414,733
France.....	6,634,015	6,637,815
Germany.....	6,678,393	5,051,187
Spain.....	2,918,323	912,173
Other countries.....	3,454,535	8,878,561

Navigation.—The number of vessels in the foreign trade entered at Mexican ports during the year ending June 30, 1899, was 1,502, of 1,838,189 tons; cleared, 1,401, of 1,754,197 tons. The merchant navy in 1898 consisted of 51 sailing vessels, of 9,317 tons, and 17 steamers, of 4,081 tons.

Railroads, Posts, and Telegraphs.—The length of railroads in operation in 1900 was 9,027 miles. The traffic in 1898 was 9,061,646 passengers and 5,964,183 tons of freight; gross receipts, \$37,800,596.

The post-office in 1899 transmitted 122,620,216 letters and postal cards; receipts, \$1,595,818; expenses, \$1,991,921.

The telegraphs had a total length in 1899 of 42,000 miles, of which 28,560 miles belonged to the Federal Government and the rest to state governments and telegraph and railroad companies. The number of despatches in 1898 was 2,288,946. There were 17,678 miles to telephones in 1899.

The Maya Rebellion.—The Mexican Government has made great efforts to bring into subjection the Mayas of Yucatan, a state only lately redeemed from the wild condition, but now undergoing a rapid development owing to the cultivation of henequen. The agave fiber goes to the United States, and the price has steadily risen. The plant covers 350 square miles, and the exports in 1900 were nearly 500,000 bales. The English machinery formerly used in separating the fiber is superseded by American automatic machines, the imports of which, and of portable rails and

general supplies, were large in 1900. From Yucatan are exported also logwood to Europe, and deerskins, hides, and chewing-gum to the United States. The interminable warfare against the independent Mayas in the southeastern part of the state was alternated in the early part of 1901 with efforts to secure their submission by pacific means. These were not successful, and later there was a fresh and more formidable development of military force.

MISSIONS, FOREIGN, SOCIETIES OF.

The eighth annual Conference of Officers and Representatives of Boards and Societies of Foreign Missions in the United States and Canada was held in the city of New York, Jan. 16-18. The first of these conferences was held in 1893, by invitation of the Presbyterian Board of Foreign Missions, and a conference of similar character followed in every year thereafter except 1900, when its place was taken by the Ecumenical Conference of Foreign Missions. Much is claimed to have been done by these conferences to promote mutual understanding among missionary boards and societies, the growth of comity and cooperation on the mission field, and self-support by the native churches. Between 30 and 40 mission boards were represented at the present meeting, and important papers on a variety of topics were presented and discussed. A minute was adopted in reply to a recent appeal by 5 Buddhist sects in Japan "to ecclesiastics throughout the world" concerning missions in China. A committee was appointed to prepare a plan for a central bureau of missionary information and submit it to the boards represented in the conference. The plan is to be carried into effect when it has received the approval of three-fourths of these boards.

The American Board is accustomed to issue every year a summary of the general statistics of all Protestant foreign missions, as compiled by its statistical secretary, the Rev. Dr. E. E. Strong. The summary for 1901 (December) shows that these missions, representing the Protestant churches in the United States, Canada, Great Britain and Ireland, Europe, Asia, Africa, and Oceanica, include 6,229 stations, 23,188 out-stations, 12,412 missionaries, 70,218 native laborers, 13,526 churches, 1,285,227 communicants, and total receipts of \$18,121,120. The total income for the year of British foreign missionary and kindred societies was \$8,575,306. The summaries of 33 principal foreign mission societies in the United States show—number of principal stations, 829; of out-stations, 6,035; of American missionaries, 3,635; of native laborers, 17,427; of churches, 3,981; of communicants, 405,653; of members added during the year, 32,251; of persons under instruction, 208,502; amount of native contributions, \$619,834; amount contributed in America for the support of the missions, \$5,636,758. More than 30 foreign missionary societies were laboring in Japan, where 157 stations and 734 out-stations were occupied.

MISSOURI. (See under UNITED STATES.)

MONTANA. (See under UNITED STATES.)

MORAVIANS. The official statistics of the American Moravian Church, Dec. 31, 1900, give it in the two districts, Northern and Southern, 15,225 communicants, 1,630 non-communicants, and 6,612 children, making a total of 23,467 members; 13,743 pupils and 1,510 officers and teachers in Sunday-schools. The contributions of the churches of the Northern district (18,195 mem-

bers) for the year were: For church support, \$127,798; for retired ministers, \$2,259; for the Bohemian mission, \$1,535; for foreign missions, \$6,076; for the Alaska mission, \$2,926; for home missions, \$9,056; for the theological seminary, \$3,368; for all other Moravian causes, \$1,668; for general Christian objects, \$2,285; the total, as footed up in the tables, being \$29,175. The total of gifts reported by the provincial treasurer as passing through his hands for Moravian causes alone, excluding all income from funds, gifts for individual churches, and collections made by individual pastors, was \$28,547.

Gifts of \$4,846 were made during 1900 to the Moravian College and Theological Seminary, in addition to which the library of the institution received a considerable collection of books and pamphlets of theological and historical interest from Mr. F. Leinbach.

The contributions of the churches to the Alaska mission for the year ending July 31 footed up to \$3,120. The Society for the Propagation of the Gospel appropriated \$8,449; and with other miscellaneous items, the total receipt and expenditure of the mission was \$14,157. The mission returned 780 members of all classes, showing a decrease of 214, which was attributed to the unusually large number of deaths, the result of an epidemic of influenza. Had the death-rate been no larger than in the previous year the figures would have shown an increase of 40. Two hundred and sixty-nine "new people" and candidates were returned, 17 persons had been confirmed during the year, 14 couples married, and 32 members placed under church discipline. The missionary force consisted of 5 brethren and 7 sisters, with 21 native helpers.

At the annual meeting of the London Association in aid of Moravian Missions, May 3, it was reported that the number of stations was 190, with 266 day-schools attended by about 25,000 pupils, and 123 Sunday-schools, numbering more than 18,000 pupils. The most pressing needs at present were largely increased help for the General fund, £10,000 for the Medical Missionary fund, £500 for the leper home at Jerusalem, and £2,000 annually would be required for a few years, till the mission in Labrador could be reestablished on a firmer footing.

MOROCCO, an empire in northern Africa. The Emperor is an absolute monarch, ruler in temporal and spiritual affairs, deferring occasionally in religious matters to the Sharif of Taflet and often in civil affairs to his Grand Vizier or Chamberlain. The reigning Sultan is Mulai Abdul Aziz, born Feb. 24, 1878. The Grand Vizier in the beginning of 1901 was Abdullah ben Ahmed; Minister of Foreign Affairs, Abdul Krim ben Sliman; Minister of War, Kaid el Mehedi el Menebhi; Minister of Finance, Shuiikh Tasi; Grand Chamberlain, Mohammed ben Dris ben Allem.

Morocco has an area of about 219,000 square miles, of which all except 53,800 square miles is desert. The population is estimated variously between 2,750,000 and 9,400,000. Fez, the northern capital, has about 140,000 inhabitants; Tangier, 30,000, including 5,000 Christians; Morocco, the southern capital, 50,000.

Abdul Aziz, the young Sultan of Morocco, was the favorite son of the late Sultan, Mulai Hassan, and his chosen heir, though a younger son, child of a Georgian slave whom Fedul Garnit, the companion of his childhood, who made the pilgrimage to Mecca for him by proxy, brought back with him from Constantinople for his own harem, and presented to his master when the latter expressed a wish to see the famous beauty. This white

slave, Lella Rekia, took precedence in the Sultan's affections over his four Sherrefia and numerous concubines, and had her son designated as his successor. The people were not content with this choice, nor the army, nor the officers. The Mulai Hassan died suddenly in his tent in the neighborhood of Rabat, his Chamberlain, Bo Hamed ben Musa, who was nearest to him, the highest in authority where none enjoyed much political power, for the late Sultan was his own Chancellor, concealed the death, even from the palanquin-bearers who carried the corpse, until he had proclaimed Mulai Abdul Aziz and taken possession of the palace, the royal treasury, and the offices in his name. There was a rising in favor of the eldest son which Bo Hamed crushed. The youthful Sultan made Bo Hamed his Grand Vizier, and left everything to him, and Bo Hamed used his opportunities as Moorish Grand Viziers do when the Sultan's despotic power is entrusted in their hands. He amassed a fortune of many millions, and was feared and dreaded from one end of Morocco to the other, until he himself was afraid to leave the city of Morocco, where he built a magnificent palace. His chief lieutenant and confidant was the Kaid Mehedi el Menebhi, who had been imprisoned with his relations during the reign of Mulai Hassan. Bo Hamed released them for a bribe and took the young man, who was attractive, energetic, and crafty, into favor. When Bo Hamed died the expected civil disturbances which usually follow the demise of the man of power in Morocco did not occur. His mantle fell on Mehedi el Menebhi, who made his position secure by bringing into the royal coffers the vast wealth of Bo Hamed, whose relatives were cast into prison. The wily courtier did not at once grasp the office of Vizier, but put forward a man of riper years and reputation, Abdullah ben Ahmed, taking for himself the post of Minister of War, though in affairs of state his voice was more potent with the Sultan, who still remained in the southern capital and was more interested in photography, cycling, and other European inventions than in the government of his empire. The old Vizier's conservative notions were shocked when he saw the Commander of the Faithful riding a bicycle. He ventured to reprove his Sherrefian Majesty, and the time of Mehedi el Menebhi having arrived, he lost his office in the customary way, being suddenly and secretly carried away in March, 1901, to a distant town and cast into chains together with his relations, his fortune being garnered into the Sultan's treasury. Other high officials were dismissed and degraded like the Vizier el Hadji el Mokhtar, and their property was confiscated, including freed slaves as well as those still in bondage, all of whom to the number of 1,050 were sold in the open market.

The constant residence of Mulai Abdul Aziz in the city of Morocco caused a great relaxation of his authority throughout the empire. His predecessors had ruled as the Romans did in north Africa by setting up rivals in power and inciting tribes against one another in order to triumph over both. Fear and terror, accompanied by a reverential regard for the dynasty of Filali, descended from the Prophet, have kept the turbulent Berber tribes of the plains and the mountains in submission, while the voluptuous Moors of the cities are willing to pay a rich tribute if they are permitted to enjoy their lives and property from one year to another. The ambulant court, sojourning now in the north, in Fez or Mequinez, now in the south, in Rabat or Morocco, accompanied on the march to and fro by an army that

fell upon the provinces and tribes that were dilatory or recalcitrant in the payment of taxes, leaving the districts thus sat upon as bare as if a plague of locusts had visited them, kept the country districts in subjection and the cities contented with the lively trade which sprang up when the Sultan took up his periodical residence within their walls. Disaffection and lawlessness crept in when Bo Hamed and Mehedi el Menebhi for their private purposes kept the Sultan in the same city year after year. The restless province of Sus rebelled openly. In the far southeast the authority of the Sultan was defied, and the tribes made raids into the districts recently annexed by France and aided the inhabitants in resisting French troops. The country between Fez and Tafilet was given over to robbery and anarchy. Close to Tangier the districts of El Kasar, Arsila, and Gharb were full of unrest, disorder, and crime. A United States war-vessel was ordered to Tangier in the spring of 1901 for the purpose of conveying M. Gummeré, the American consul-general, to Mazagan, on a special mission to Morocco for the adjustment of claims made by American *protégés*. The Grand Vizier and the Minister of Foreign Affairs had refused to admit a special mission to the Moorish court, and for their discourtesy the consul-general was instructed to demand an apology. Later the special mission was countermanded from Washington. The French Government threatened to hold the Moorish Government responsible for predatory incursions of Berber tribes into French territory, but M. Jonnart, on entering upon office as Governor-General of Algeria, preferred to use only diplomatic means in dealing with Morocco. The Moorish Government offered satisfaction for the murder of a Frenchman named Pouzet in the Riff hills and for the seizure of Boneoyas and other questions with Algeria. M. Revoil, the French minister to Morocco who brought the Moorish court to terms, became M. Jonnart's successor when the latter had to retire for reasons of health from Algeria. The Berbers had attacked the French post at Salah Matefor and later joined the natives of the oases in a pitched battle with a French force at Timimun, 120 miles from the most advanced Moorish posts. These aggressions ceased when the Moorish Government, after a threatening visit of French cruisers to Tangier, gave up its pretensions to Tuat, and despatched an embassy to Paris, which afterward visited St. Petersburg. Another embassy went to London to congratulate King Edward on his accession to the throne, and afterward to Berlin. Kaid Mehedi el Menebhi was the head of this mission, on which he was accompanied by the Kaid Maclean, a Scotch military instructor who became a Moor.

While Mehedi el Menebhi was absent his enemies gained the ear of the Sultan. Lella Rekia wished to promote her old friend Sid Garnit to the office of Grand Vizier. Abdul Aziz was informed that Mehedi el Menebhi had kept for himself several million dollars of Bo Hamed's fortune, and that in London he had promised concessions that would be pecuniarily profitable to him but otherwise detrimental and dangerous. The migration of the court from the region where his influence was powerful to Fez, which it had not visited for six years, was at last decreed. El Menebhi, hearing of these things as he was departing from Berlin, returned to Morocco as fast as steam and fleet horses could carry him, and took up the contest with his rival. He found that he had been supplanted as Minister of War, that his bodyguard was disbanded, that his creatures in office were removed and imprisoned, and that a

brother of Sid Garnit was Minister of Justice. When Mehedi el Menebhi reached Morocco he was not disgraced or arrested; neither, on the other hand, did he regain his former ascendancy over the Sultan. He was reappointed Minister of War in the place of Abdesalam Zemrani, who had received the appointment in his absence. His contest with Sid Garnit for the grand vizierate interrupted all business. In the end his rival obtained the post, yet his power and influence were not destroyed. The departure of the court for Fez was postponed indefinitely. The convention that Mehedi el Menebhi concluded with the British Government in June was not ratified, excepting a provision permitting the exportation of potatoes, tomatoes, and bananas on payment of a 5-per-cent. duty. Lawlessness and discontent became more serious throughout the country. A Spanish girl and boy near Tangier were carried off into slavery. The Spanish Government demanded the payment of \$1,000 a day until they were restored. All the powers supported Spain, and warned the Sultan of the gravity of the case. The Sultan finally sent 3,000 soldiers to effect the release of the captives and punish the Kabyles who had abducted them. He also agreed to pay the damages claimed by the Spanish Government. Mehedi el Menebhi maintained his position at court with difficulty, though defiantly. In political affairs he remained the chief adviser of the Sultan, who announced several reforms. He promised to amend the prison administration throughout the country, which has been abominable. The country prisons are walled enclosures without roof or shade, in which prisoners wear iron collars attached to a long heavy chain fastening them together. The mere possession of money saved is enough to cause a farmer to be incarcerated without trial. The prisoners have bad water supplied irregularly, and for food must depend upon their friends. Abdul Aziz has promised to appoint inspectors who shall see that the prisons are properly built and kept and rations supplied to prisoners. Another important reform is the removal of the obstacles to trade between the ports of Morocco, which have been so serious that wheat was usually five times as dear in the northern parts as in southern Morocco, where it is grown. A new system of taxation has been decreed whereby the collection is taken away from the governors, who practise extortion, and is conducted by special officials.

The pacific policy of France toward Morocco coincides with the extension of French dominion and influence in the Sahara behind Morocco in regions which the Sultan claimed as a part of his empire, though Moorish sovereignty there is not apparent. This claim he was constrained to withdraw when his protests met with no support. The boundary between Algeria and Morocco was defined in the treaty of 1845 as far as the Sahara. In the desert no territorial boundary was fixed. Certain Arab tribes were recognized as French and others as Moorish, and the two governments mutually conceded to each other the right to pursue and punish its own subjects in any part of the Sahara, but not the subjects of the other Government. The Moorish Government pressed for a delimitation in 1879, in 1885, and in 1891. The French Government, proceeding on the principle that the absence of an official boundary is advantageous to the stronger power, raised difficulties in the way of carrying out the clause in the treaty of 1845 which provides for prolonging the frontier line south of Teniet el Sassi by a mixed commission. Si Abdul Kerim, the Minister of Foreign Affairs, who went as special ambassador to Paris,

arranged with M. Delcassé a *modus vivendi* governed by the principle embodied in the treaty of 1845, according to which each Government is to keep its own subjects in restraint in the Hinterland of Morocco. The Shereefian court recognized the accomplished facts, and therefore abandoned

its claims to the Sahara, withdrew all the objections it had offered to the construction of the French railroad to the southwest, and to the organization under French rule of the tribes in the western oases, and agreed to the establishment and maintenance of a frontier police.

N

NATIONAL ACADEMY OF SCIENCES.

The officers of the academy in 1901 were: President, Alexander Agassiz; Vice-President, Asaph Hall; Foreign Secretary, Ira Remsen; Home Secretary, Arnold Hague, Metropolitan Club, Washington, D. C.; Treasurer, Charles D. Walcott. Two meetings were held in 1901.

The first or stated meeting was held in Washington, April 16 to 18. On that occasion the following papers were read: The Climatology of the Isthmus of Panama, by Henry L. Abbot; Simultaneous Volumetric and Electric Graduation of the Condensation Tube, by Carl Barus; Conditions Affecting the Fertility of Sheep and the Sex of their Offspring, by Alexander Graham Bell; Table of Results of an Experimental Inquiry regarding the Nutritive Action of Alcohol, prepared by Prof. W. O. Atwater, of Middletown, Conn., presented by John S. Billings; The Significance of the Dissimilar Limbs of the Ornithomorphous Dinosaurs, by Theodore Gill; The Use of Formulæ in Demonstrating the Relations of the Life History of an Individual to the Evolution of its Group, by Alpheus Hyatt; The New Spectrum, by Samuel P. Langley; The Place of Mind in Nature, and The Foundation of Mind, by John W. Powell; Artificial Parthenogenesis and its Relation to Normal Fertilization, by Edmund B. Wilson; and The Effects of Secular Cooling and Meteoric Dust on the Length of the Terrestrial Day, by Robert S. Woodward. The public business included the award of the Draper medal to Sir William Huggins, of London, England, for his researches in astrophysics.

The following foreign associates were elected at this meeting: A. Bornet, M. Cornu, J. Jannssen, and M. Loewy, of Paris, France; Sir Archibald Geikie, of London, England; and H. Kroniker, of Bonn, and Friedrich Kohlrausch, of Berlin, Germany, all of whom have attained unusual prominence in their various branches of science. The vacancy caused by the retirement of Dr. Walcott Gibbs from the presidency was filled by the election of Alexander Agassiz to that office. The latter for some years had been foreign secretary, and Ira Remsen was elected to fill that place, while Arnold Hague, of Washington city, was chosen home secretary. The following additional members of the council were elected: John S. Billings, Henry P. Bowditch, George J. Brush, Arnold Hague, Samuel P. Langley, and Simon Newcomb. The new members elected at this meeting were: George Ferdinand Becker, who, since 1879, has been connected with the United States Geological Survey; James McKeen Cattell, who fills the chair of Psychology in Columbia University, and is the editor of Science; Eliakim Hastings Moore, head Professor of Mathematics in the University of Chicago since 1890; Edward Leamington Nichols, who, since 1887, has held the chair of Physics in Cornell University; and Theophile Mitchell Prudden, Professor of Pathology in Columbia University and director of its histological laboratory. The preparation of a memoir on John G. Barnard was assigned to Henry L. Abbot, and one on Henry A. Rowland to Ira Remsen.

The scientific session was held in the University of Pennsylvania, Philadelphia, Nov. 12, 13, and 14, 1901, when the following papers were read: The Monatomic Gases, and On the Newer Forms of Incandescent Electric Lamps, by George F. Barker; On Quadrant Electrometry with a Free Light Needle highly charged through a Conductor of Ionized Air, and On Nuclear Condensation in the Vapor of Non-Electrolytes like Benzene, and on Graded Condensation, by Carl Barus; Note on Linear Force exerted by Growing Crystals, and Note on the Orogenic Theory of Tilted Blocks, by George F. Becker; The Work of the International Association of Academies, by Henry L. Bowditch; On the Pseudo-Catalytic Action of Concentrated Acids, by James M. Crafts; Snake Venom in Relation to Hæmolysis, Bacteriolysis, and Toxicity, by S. Weir Mitchell and Simon Flexner; A New Gage for the Direct Measurement of Small Pressures, and Transmission of Heat through Vapor of Water at Small Pressures, by Edward W. Morley and Charles F. Brush; Dolichocephaly and Brachycephaly as the Dominant Factors in Cranial Evolution, Cranial Evolution of Titanotherium II, and Latent or Potential Homology, by Henry F. Osborn; On the Logic of Research into Ancient History, by Charles S. Peirce; On the Use of the Stereographic Projection in making Accurate Maps, with Criticism of Some Recent Methods of Map Projection, and The Tendency of Complex Chemical Radicals to control Crystallization because of their Mass Effect; A Study in Isomorphism, by Samuel L. Penfield; On the Nature of the Double Halides, by Ira Remsen; and Observations on Tungsten, by Edgar F. Smith. Also a Biographical Memoir of Frederick Augustus Genth, by George F. Barker, and a Biographical Memoir of Gen. John Newton, by Cyrus B. Comstock; and the following papers by non-members of the academy: A Method of Rearing Marine Larvæ, by Caswell Grave, introduced by William K. Brooks; and On the Vaso-Motor Supply of the Lungs, by Horatio C. Wood, Jr., introduced by George F. Barker.

No business of public importance was transacted at this session. During the year the academy lost by death Joseph Le Conte, Richmond Mayo-Smith, Henry A. Rowland, and Charles A. Schott, of whom brief biographies are given under OBITUARIES, AMERICAN.

NEBRASKA. (See under UNITED STATES.)

NETHERLANDS, a monarchy in western Europe. The legislative authority is vested in the States General, consisting of the First Chamber, containing 50 members elected by the provincial councils for nine years, and the Second Chamber, containing 100 members elected for four years by all citizens who pay direct taxes or are legally qualified for any profession or employment, or who have money in the savings-bank or a salary of 275 guilders a year, or who are owners of boats or occupants of their dwellings. The reigning sovereign is Queen Willemina, born Aug. 31, 1880, daughter of the late King Willem III and Queen Emma, born a Princess of Waldeck. The Queen succeeded to the throne at the death of her father

on Nov. 23, 1890, assumed the royal authority on Sept. 6, 1898, the Queen Dowager having acted as regent during her minority, and married on Feb. 7, 1901, Prince Henry of Mecklenburg-Schwerin.

The Council of Ministers at the beginning of 1901 was composed as follows: President of the Council and Minister of Foreign Affairs, Dr. W. H. de Beaufort; Minister of Justice, Dr. P. W. A. Cort van der Linden; Minister of the Interior, H. Goeman Borgesius; Minister of Marine, Vice-Admiral J. A. Roell; Minister of Finance, N. G. Pierson; Minister of War, Lieut.-Gen. K. Eland; Minister of Waterstaat, Commerce, and Industry, C. Lely; Minister of the Colonies, J. T. Cremer.

Area and Population.—The area of the Netherlands, or Holland, is 12,648 square miles. The population on Dec. 31, 1899, was estimated at 5,139,565, divided into 2,520,380 males and 2,583,544 females. The proportion living in large towns was 36.7 per cent. Amsterdam had at the end of 1899 a population of 523,557; Rotterdam, 319,866; The Hague, 205,328; Utrecht, 102,040. The number of marriages in 1899 was 37,990; of births, 163,289; of deaths, 87,319; excess of births, 75,970. The number of emigrants in 1899 was 1,347, of whom 1,260 were bound for America and 87 for Africa. The total comprised 674 men, 332 women, and 341 children. The total number of emigrants, Dutch and foreigners, who sailed from Dutch ports, was 20,296.

Finances.—The ordinary revenue for the fiscal year 1899 was 146,486,738 guilders, and the extraordinary receipts from loans and other sources were 1,535,019 guilders; total, 148,021,758 guilders. Of the ordinary receipts 34,093,180 guilders were derived from direct taxes, 47,375,616 guilders from excise, 22,824,246 guilders from indirect taxes, and 9,191,107 guilders from customs duties. The expenditures in 1899 were 37,634,224 guilders for the army and navy, 37,969,326 guilders for the expenses of the debt, 13,085,961 guilders for public works, and 61,504,478 guilders for general expenses of government; total, 150,193,989 guilders. The budget estimate of revenue for 1900 was 151,260,244 guilders, and of expenditure 144,723,185 guilders. For 1901 the budget estimate of revenue was 149,472,180 guilders, of which 12,832,000 guilders came from the land tax, 8,750,000 guilders from the personal tax, 7,200,000 guilders from the tax on capital, 6,020,000 guilders from the tax on incomes from trades and professions, 48,510,000 guilders from excise duties, 21,667,000 guilders from indirect taxes, 9,618,000 guilders from import duties, 310,000 guilders from the tax on gold and silver, 1,764,000 guilders from domains, 10,389,000 guilders from the post-office, 2,248,500 guilders from the telegraphs, 651,000 guilders from the state lottery, 132,000 guilders from shooting and fishing licenses, 2,300,000 guilders from pilot dues, 11,155 guilders from dues on mines, 4,338,150 guilders from Government railroads, 3,861,000 guilders paid by the East Indies for interest and sinking-fund of the public debt, and 8,869,275 guilders from miscellaneous sources. The expenditure for 1901 was estimated at 154,755,492 guilders, of which 800,000 guilders are the civil list, 681,500 guilders are expenses of the legislative body and the royal Cabinet, 853,218 guilders are for the Department of Foreign Affairs, 6,349,916 guilders for the Department of Justice, 15,966,758 guilders for the Department of the Interior, 16,657,694 guilders for the Department of Marine, 25,108,117 guilders for the Department of Finance, 22,716,429 guilders for the Department of War, 29,380,074 guilders for the Department of Public Works, 1,317,218 guilders for the Department of

the Colonies, 34,874,568 guilders for the public debt, and 50,000 guilders for contingencies.

The funded debt in 1901 consisted of 624,995,400 guilders paying 2½ per cent. interest and the 3-per-cent. loans of 1895, 1898, and 1899, amounting to 518,740,050 guilders; total, 1,143,735,450 guilders, in addition to which, besides 15,000,000 guilders of paper money, there were 264,481 guilders of annuities and a floating debt requiring the annual payment of 300,000 guilders, making the annual debt charge 34,874,568 guilders, including a sinking-fund of 3,121,000 guilders.

The Army and Navy.—The peace strength of the army on June 1, 1899, was 1,919 officers and 25,066 men. All young men at the age of nineteen who are capable of bearing arms, except theological students, are liable to be drawn for service, the annual recruit being 11,000, and since 1898 substitution has not been allowed. Only sons are excused, and only two sons are taken from five in a family. Exemptions for physical defects are liberally allowed. One year with the colors is required in the infantry and twice that time in the cavalry. The conscripts serve alongside of enlisted soldiers, who are still the main reliance, though no longer forming the majority. They volunteer for six or eight years and form one-third of the annual recruit. The active militia in 1899 numbered 43,025 men. It is composed of men drawn by lot at the age of twenty-five from among those who have escaped conscription. The general levy, including all who do not belong to the army or the militia up to the age of forty-five, can only be called out for the defense of the country.

The naval force was strengthened in 1896 and 1898 by 5 protected cruisers, 3 of 3,900 tons—the Holland, Friesland, and Zeeland—and 3 of 3,950 tons—the Gelderland, Nordbrabant, and Utrecht—each armed with 2 6-inch, 6 4.7-inch, 4 3-inch, and 12 smaller quick-firers. Four armored cruisers of 3,520 tons were launched in 1894, and 4 of 5,000 tons are building, the latter to have a speed of 17 knots and to carry 2 9.4-inch guns, with 4 6-inch, 8 3-inch, and numerous small quick-firers. There are building also 3 monitors of 1,500 tons armed with 2 8-inch guns and 1 6-inch, 2 4.7-inch, and 4 3-inch quick-firers and 3 of 1,400 tons, armed with 1 8-inch gun, 1 4.7-inch, and 4 3-inch quick-firers. The new ships have Yarrow water-tube boilers. They are supplemented by a torpedo flotilla consisting of 13 first-class, 15 second-class, and 30 third-class boats.

Navigation.—The number of vessels entered at Dutch ports during 1899 was 11,803, of 9,467,730 tons, of which 10,952, of 9,177,450 tons, were with cargoes and 851, of 290,280 tons, in ballast; cleared, 11,672, of 9,392,682 tons, of which 7,244, of 4,640,586 tons, were with cargoes and 4,428, of 4,752,096 tons, in ballast. Of the total number entered 3,267, of 2,354,100 tons, were Dutch and 8,536, of 7,113,630 tons, were foreign, and of those cleared 3,293, of 2,351,622 tons, were Dutch and 8,379, of 7,041,060 tons, were foreign. Of the vessels with cargoes 63.3 per cent. were entered and 49.4 per cent. cleared at the port of Rotterdam, 16.6 per cent. entered and 19.9 per cent. cleared at Amsterdam, and 7.2 per cent. entered and 14.1 per cent. cleared at Flushing. The merchant navy on Jan. 1, 1900, consisted of 432 sailing vessels, of 84,606 tons, and 192 steamers, of 236,118 tons.

Commerce and Production.—The area uncultivated in 1898, including building land, roads, dikes, marsh, and heath, was 895,722 hectares, and the cultivated area was 864,894 hectares under farm crops and 61,710 hectares in gardens and

orchards, while 249,886 hectares were covered with woods and 1,185,209 hectares were pasture. Rye, potatoes, oats, wheat, the sugar-beet, beans, barley, buckwheat, and peas are the most important crops, and flax, rape-seed, tobacco, and madder are some of the minor products. The production of wheat and rye is inadequate for the country's needs, 121,649,000 guilders in value of wheat having been imported in 1899, and 63,652,000 guilders of wheat and rye flour and 84,587,000 guilders of rye, offset by exports of 93,799,000 guilders of wheat, 10,525,000 guilders of flour, and 38,789,000 guilders of rye. The imports of barley were 27,687,000 guilders, and exports 20,292,000 guilders; imports of oats 22,842,000 guilders, and exports 19,049,000 guilders; imports of potato flour 5,401,000 guilders, and exports 14,273,000 guilders; imports of buckwheat 2,116,000 guilders, and exports 612,000 guilders; imports of flax, 1,100,000 guilders, and exports 12,507,000 guilders; imports of beets 52,000 guilders, and exports 2,730,000 guilders. Of bulbs, shrubs, and nursery stock the value of 493,000 guilders was imported and 6,064,000 guilders exported. Imports of vegetables were valued at 2,238,000 guilders, and exports at 40,585,000 guilders. The fisheries employed 5,661 vessels and 19,232 men in 1899, and the herring catch in the North Sea was valued at 5,626,068 guilders. About 40,000,000 oysters are produced annually, and a quarter of them are exported to England.

The total value of imports in 1899 was estimated at 1,916,000,000 guilders, and the value of exports at 1,583,000,000 guilders. The imports of grain and flour were valued at 322,533,000 guilders, and exports at 183,076,000 guilders; imports of iron and steel of all kinds were 171,226,000 guilders in value, and exports 112,810,000 guilders; imports of textile manufactures and materials were 123,547,000 guilders, and exports 90,023,000 guilders; imports of copper were 74,910,000 guilders, and exports 71,271,000 guilders; imports of timber and wood were 55,470,000 guilders, and exports 39,508,000 guilders; imports of coffee were 52,066,000 guilders, and exports 32,087,000 guilders; imports of rice were 58,017,000 guilders, and exports 25,295,000 guilders; imports of sugar were 19,245,000 guilders, and exports 52,887,000 guilders; imports of margarin were 20,628,000 guilders, and exports 48,854,000 guilders; imports of coal were 52,195,000 guilders, and exports 6,145,000 guilders; imports of hides and skins were 27,115,000 guilders, and exports 30,973,000 guilders; imports of saltpeter were 29,805,000 guilders, and exports 23,907,000 guilders; imports of oil-seeds were 30,348,000 guilders, and exports 12,968,000 guilders; imports of paper were 5,391,000 guilders, and exports 35,640,000 guilders; imports of tin were 20,809,000 guilders, and exports 17,581,000 guilders; imports of grease and tallow were 25,416,000 guilders, and exports 12,815,000 guilders; imports of paints were 17,622,000 guilders, and exports 13,317,000 guilders; imports of precious metals were 10,202,000 guilders, and exports 15,386,000 guilders; imports of zinc were 11,358,000 guilders, and exports 11,111,000 guilders; imports of butter were 1,282,000 guilders, and exports 20,379,000 guilders; imports of tobacco were 9,485,000 guilders, and exports 6,993,000 guilders; imports of cheese were 77,000 guilders, and exports 15,936,000 guilders; imports of flax were 1,100,000 guilders, and exports 12,507,000 guilders; imports of indigo were 5,387,000 guilders, and exports 6,484,000 guilders; imports of mineral oil were 12,041,000 guilders, and exports 70,000 guilders. The values are estimated, official records being taken of the weight of goods

only, which in 1899 reached the total of 25,270,000,000 kilograms for imports, 16,870,000,000 kilograms for exports, 999,000,000 kilograms in transit, and 4,647,000,000 kilograms in transit. Of the total estimated value of imports 509,185,000 guilders represent articles of raw materials, 984,000 guilders raw materials, 217,981,000 guilders manufactured goods, and 378,605,000 guilders miscellaneous merchandise; and of the total value of exports food products make 463,288,000 guilders, raw materials 310,288,000 guilders, manufactured products 220,308,000 guilders, and miscellaneous products 309,310,000 guilders.

The estimated values of special imports from and exports to the principal countries in 1899 were in guilders as follow:

COUNTRIES.	Imports.	Exports.
Prussia.....	303,500,000	806,200,000
Great Britain.....	277,000,000	348,700,000
Belgium.....	205,800,000	159,400,000
Dutch East Indies.....	289,100,000	68,100,000
United States.....	297,100,000	60,700,000
Russia.....	204,900,000	8,400,000
France.....	21,900,000	44,100,000
Hamburg.....	28,700,000	26,800,000
British India.....	45,400,000	
Italy.....		7,800,000

Railroads, Posts, and Telegraphs.—The railroads of Holland had a total length of 1,725 miles in 1899, of which 968 miles belonged to the Government, having been built at a cost of 270,509,000 guilders. The Government railroads in 1899 carried 11,733,000 passengers and 7,060,000 metric tons of freight, the total receipts being 23,306,000 guilders and expenses 18,939,000 guilders, while on the railroads of companies 16,131,000 passengers and 4,141,000 tons of freight were carried, receipts having been 18,060,000 guilders and expenses 13,890,000 guilders.

The post-office in 1899 transmitted 72,137,000 internal and 27,803,000 foreign letters, 43,429,357 internal and 8,422,313 foreign postal cards, 134,762,000 internal and 15,371,000 foreign newspapers, etc., 4,075,257 internal and 971,032 foreign parcels, and 1,300,476 internal and 1,160,583 foreign money-orders; receipts were 9,643,400 guilders, and expenses 7,291,577 guilders.

The state telegraph lines on Jan. 1, 1900, had a length of 3,689 miles, with 13,511 miles of wire. The number of private despatches in 1899 was 5,218,320; receipts were 2,031,945 guilders, and running expenses 2,346,482 guilders.

Politics and Legislation.—A project completing the reform of the army was before the States General in the early months of 1901. Gen. Eland proposed to remodel the army on the German pattern, the object being to secure the maximum number of fighting men at a minimum cost. Every youth not disqualified was to be trained as a soldier, the annual contingent being increased to 17,000 and the term of service with the colors reduced to eight months for the infantry and eighteen months for the cavalry. The Moderate Liberals approved the scheme; the Conservatives were strongly opposed to universal service and the general Germanizing of the army. It was proposed to replace the obsolete Schuttery, or militia, with a Landwehr, composed of men between the ages of twenty-six and thirty-four who had completed their term of service in the regular army and its reserve. The Landsturm would then be composed exclusively of officers and men pensioned after fifteen years of service in the army and the Landwehr. A reform so sweeping it was not proposed to carry out at once, but only gradually. An amendment passed by the Second Chamber limiting the maximum term in barracks to

eight and a half months led Lieut.-Gen. K. Eland to resign the Ministry of War on March 13. The term of eight months which Gen. Eland considered sufficient for the training of a soldier, an opinion in which the commanders of the army did not agree, was actually in force three years. Not wishing to bind his successors, he did not make the legal period eight months, but in the bill fixed it at twelve months, leaving it optional with the military authorities to reduce it to eight months if they deemed it unnecessary to keep the soldiers longer under arms. The Radicals in the Second Chamber, who agreed with the Minister of War, sought by their amendment to compel him to stand up for the principle that he had advocated and practised for years, and when he refused to take the responsibility, by carrying the amendment with 47 votes to 44 they compelled him to resign, the Catholics and the Socialists joining them in defeating the minister. J. A. Roell, the Minister of Marine, took the portfolio *ad interim* until it was given to Gen. Kool, who accepted the amendment subject to restrictions. The elections intervened before the questions connected with military reform were decided. In the municipal and provincial elections gains were made by both the Catholics and the Socialists at the expense of the old Liberal or Moderate party, indicating a reversal of the last verdict of the country, which gave the Liberals a clear majority of only 2, or 52 seats to 45 won by the Catholics and Protestants and 3 by the Socialists. The Liberal majority had already disappeared, they having lost 2 seats in by-elections to the Right, which was composed of 22 Catholics and 25 Anti-Revolutionists. The Liberal party was divided, the Moderate section having in February rejected a program embracing universal suffrage for both sexes, separation of church and state, and tariff reform, which caused many Radicals to join the Socialists or to stand aloof. The Left was split up into the Moderate Liberals, the Advanced Liberals, the Radicals, the Democratic Liberals, and the Social Democrats, all of whom put candidates into the field for the first ballot, the second ballot being confined by law to the two candidates who obtained the highest number of votes. A dwelling-house act, supplementary to a public-health act that previously became law, provides for the appointment of a commission of medical and lay members to inspect the houses of the poor and for the erection in populous centers of special dwellings having more rooms, more breathing space, and brighter surroundings than those now existing. A considerable proportion of the laboring people of Holland have been accustomed to live in houses consisting of one room and an attic. The bill empowers the parish councils to order the demolition of houses found to be insanitary and a menace to the health of the neighborhood. It passed the Second Chamber by a majority of 68 votes.

The general election took place on June 12, and resulted in a defeat for the old Liberals, who obtained only 27 seats, to 25 won by the Catholics and 30 by the Protestant Anti-Revolutionists, while the Historic Christians, organized in 1897 to protest against the Anti-Revolutionary alliance of Calvinists and Catholics which they afterward joined, obtained 12 seats, the Democratic Liberals 8, the Socialists 7, and the Christian Democrats 1 seat. The Liberals lost 13 seats and the Democratic Liberals 2, while the Protestants gained 8, the Socialists 3, the Catholics 2, and the Historic Christians 2. The Historic Christians joined the ranks of the Anti-Revolutionists, of whom 24 acknowledged Dr. Kuyper as their

leader, and 8 followed Savornin Lohman, who was Prime Minister in 1890. The new Chamber consisted of 58 members of the Right and 42 members of the Left. As soon as the final results were known the Cabinet tendered its resignation. The Queen sent for Dr. Kuyper, chief of the Anti-Revolutionary party and leader of the Opposition in the late Chamber. He had difficulty in forming a Cabinet. The Right was divided on questions of public policy, although Catholic and Calvinistic Clericals were generally faithful to their coalition at the polls in the last election, as the Catholics had been in the preceding one, although the Protestants then on the second ballots gave their votes to a Liberal in preference to a Roman Catholic. The Anti-Revolutionists were in favor of a moderate protectionist tariff, and hoped thereby to obtain funds for obligatory working men's insurance and pensions with state aid. The Catholics, who were not reconciled to either protection or the proposed social reforms, claimed three seats in the Cabinet. The Cabinet was constituted on July 28, a month having elapsed since the second ballot. It was composed as follows: Prime Minister and Minister of the Interior, Abraham Kuyper; Minister of Foreign Affairs, Baron Melvil van Lynden; Minister of Justice, Dr. Loeff; Minister of War, J. W. Bergansius; Minister of Waterstaat, Commerce, and Industry, Dr. de Marez Oyens; Minister of Finance, Dr. Harte van Teeklenburg; Minister of Marine, Vice-Admiral Kruys; Minister of the Colonies, Dr. van Asch van Wyck. M. Bergansius, who was Minister of War in former Anti-Revolutionary Cabinets from 1888 to 1891, was one of the Catholics appointed. The others were Dr. Loeff and Dr. Harte van Teeklenburg. The Socialists, who were largely instrumental in bringing about the sanitary reforms of the late ministry, crowned by the improved dwellings act forbidding the construction of houses without the statutory number of rooms, were deprived of the guidance of their energetic leader, M. Troelstra, who lost his seat in the elections and was replaced by M. van Kol. A considerable deficit in the budget placed the question of finance ahead of others and furnished the new Minister of the Waterstaat with a reason for withdrawing the great project of turning three-fifths of the bottom of the Zuider Zee into agricultural land and the rest into a fresh-water lake.

The length of canals in Holland is 1,907 miles, and of other navigable waters 3,000 miles. A project for draining the Zuider Zee and adding thus 750 square miles to the cultivable area of the kingdom has been under discussion for fifty years, ever since the Lake of Haarlem was reclaimed from the sea. The annexation of the Zuider Zee is a work of much greater magnitude, which may be carried out in sections, by enclosing one tract after another with dikes and pumping the water into the sea, or, once for all, by building a great barrier dike and proceeding to reclaim the enclosed area by instalments. The latter method was preferred, and plans were made for a dike to run from Wieringen to Piaam, the estimated cost of this part of the work being 28,000,000 guilders. To raise the sea-walls, compensate the fishermen of the Zuider Zee, etc., would bring the total cost up to 57,000,000 guilders. A large part of the Zuider Zee, 560 square miles, would remain, which would become a body of fresh water, supplying water for agricultural purposes to the adjoining districts and feeding the canals. The Minister of the Waterstaat, Mr. Lely, introduced a bill providing for the building of the great dam with sluices into the North Sea in nine years and the creation of two polders, or areas of dry

land, by means of steam-pumps, the smaller one to be completed in fourteen years and the other in eighteen years. The cost of reclamation increases the total estimate to 95,000,000 guilders, to be raised by loans, adding 2,000,000 guilders to the annual budget for sixty years. The ministerial crisis began before the Second Chamber had acted on the project. The new Government declined to assume responsibility for the great outlay involved, and therefore the project was indefinitely postponed.

The new Chamber assembled on Sept. 17. Queen Willemína opened the States General in person. The legislative program announced in the speech from the throne included measures for the revision of the law relating to Sunday labor, for the repression of gambling, for the restriction of drinking-places, and for imposing additional penalties for adulteration. Among social measures was a bill compelling insurance against accidents to workmen and against sickness and the infirmities of age. As regards fiscal measures the Government proposed to remodel the tariff so as to favor national industries. The colonial policy was not to be altered, the Government intending to persevere with the police measures in Achin in the hope of bringing about the complete pacification of that region. A commission was to be appointed to inquire into the expediency of reducing the military estimates without impairing the efficiency of the forces or prejudicing the national security. The introduction of quick-firing artillery was a matter of urgency demanding considerable sacrifices.

The Dutch East Indies.—Java and the other Dutch possessions in the East, after having been ruled for two centuries by the Dutch East India Company, have now for over a century been governed by the Netherlands Government. Subject to the general laws of the States General, the Governor-General, assisted by a Council, has authority to make laws and regulations. Java, with Madura, has an area of 50,554 square miles, and the population in 1897 was 26,125,053. The other possessions, known as the outposts, are Sumatra, Riau-Lingga, Banca, Billiton, the west, south, and east coasts of Borneo, Celebes, the Molucca Islands, the Timor Archipelago, Bali and Lombok, and the western part of New Guinea to 141° of east longitude. The total area of Dutch India is estimated at 736,400 square miles, and the total population at 34,090,000. The population of Batavia, the capital, in 1897 was 115,567, comprising 9,423 Europeans, 76,751 natives, 26,433 Chinese, and 2,860 Arabs and other Asiatics; the population of Soerabaya was 142,980, of whom 6,988 were Europeans and persons assimilated to them; population of Samarang, 84,266, including 3,355 Europeans. The natives are Mohammedans. Religious liberty is guaranteed by law, and 127 missionaries were engaged in propagating Christianity in 1898. There were over 290,000 converts in the outposts, but not 20,000 in Java. The number of pilgrims who went to Mecca in that year was 9,900, of whom 7,991 returned alive. For the education of Europeans and persons assimilated to them, who do not exceed 64,000 in number, there were 164 public primary schools, with 541 teachers and 14,955 pupils in 1898, and 7 higher schools, with 102 teachers and 1,016 pupils, and 20 private schools had 160 teachers and 3,122 pupils. For natives there were in Java and Madura 223 Government primary schools, with 43,094 pupils; 216 private schools, with 23,795 pupils; 5 normal schools, with 169 pupils; and 4 schools for the sons of chiefs, with 211 pupils. In the outposts 296 Government schools had 21,388 pupils

and 205 private schools had 10,696 pupils in 1897.

The revenue in 1900 amounted to 111,989,008 guilders, of which 40.4 per cent. was raised by taxation, 21.7 per cent. by monopolies of opium, salt, etc., 20.8 per cent. by sales of coffee, tin, cinchona, and coal, and 17.1 per cent. came from other sources. The expenditure amounted to 117,766,255 guilders, leaving a deficit for the year of 5,777,247 guilders. The budget estimates make the revenue for 1901 from receipts in the mother country 28,693,434 guilders and from receipts in the colonies 121,242,500 guilders, a total of 149,935,934 guilders. The expenditure in the mother country was estimated at 39,262,928 guilders and in the colonies at 119,622,455 guilders, a total of 149,885,383 guilders, giving a surplus of 50,551 guilders. The receipts in the mother country are 19,666,697 guilders from sales of tin, 5,063,945 guilders from sales of coffee, 277,200 guilders from sales of cinchona, 985,000 guilders from railroads, 2,150,000 guilders from the Billiton Company, being the Government's share of the annual profits, and 550,592 guilders from other sources. The receipts in India are 18,365,000 guilders from sales of opium, 18,486,000 guilders from import, export, and excise duties, 22,374,300 guilders from the land revenue, 6,383,300 guilders from sales of coffee, 9,507,000 guilders from sales of salt, 12,567,000 guilders from railroads, 3,182,000 guilders from the tax on trades, 2,865,000 guilders from coal, and 27,512,900 guilders from other sources. The cost of civil administration amounts to about a third of the revenue, and the military and naval expenditure absorbs another third.

The military force at the beginning of 1899 consisted of 1,428 officers and 42,235 non-commissioned officers and privates. The commissioned officers are Europeans, and the rank and file consisted of 15,911 Europeans, 50 Africans, 4,434 Amboinese, and 21,840 natives. In the native companies half or more of the non-commissioned officers are Europeans. Soldiers of the Dutch army are allowed to enlist in the Indian army if they have the permission of their commanding officers. All the gunners and a good part of the cavalry are Europeans, and in the infantry one or two of the four companies in each battalion are composed of European soldiers, the other companies being native with European officers and instructors. There is a military academy near Batavia, and a school for the instruction of soldiers is attached to every battalion. The naval force consists of 20 vessels belonging to the colonies, manned by 1,350 Europeans and 750 natives, and 4 vessels furnished by the Netherlands Government, manned by 1,000 Europeans and 200 natives.

The Government land regularly cultivated by natives in 1898 was 6,838,533 acres in Java and Madura, and the total area under cultivation was 9,798,764 acres, of which 5,202,957 acres were planted to rice, 4,046,816 to corn, peanuts, cotton, and various other crops, 246,372 acres to sugarcane, 252,835 acres to tobacco, and 49,784 acres to indigo. The lands alienated by the Government prior to 1816 are 2,120,584 acres now owned by Europeans, and 504,001 acres owned by Chinese and other Asiatics. Unoccupied lands are granted on hereditary leases for seventy-five years, and of such 893,478 acres were taken by 752 European companies and individuals, 30,019 acres by 46 Chinese, and 1,488 acres by 5 natives in 1898. The yield of sugar in 1898 was 1,538,701,400 pounds. The yield of coffee was 17,676,800 pounds on Government lands, 9,814,800 pounds by free native cultivation, 27,973,600 pounds on leased lands, and 5,104,400 pounds on private lands;

total, 60,569,600 pounds, against 156,503,866 pounds in 1897. The yield of cinchona was 306,696 kilograms on 3 Government plantations, 3,817,234 kilograms on 83 plantations held on hereditary lease, and 337,824 kilograms on 3 plantations owned by the planters. There were 110 tobacco plantations in Java, producing 18,418,575 kilograms, and in Sumatra and other islands 115, producing 20,527,171 kilograms. The production of tea in Java was 4,757,168 kilograms; of indigo on 146 plantations, 1,094,225 kilograms. The output of tin in the Government mines of Banca and the leased mines of Billiton and Riau was 17,703 tons; the output of the coal-mines of Java, Sumatra, and Borneo, 162,760 tons; the production of mineral oil, 311,396,492 liters. The Government imports of merchandise in 1898 were 6,563,279 guilders in value and of treasure 1,600,000 guilders, and private imports of merchandise were 160,861,010 guilders and of treasure 10,797,143 guilders; total imports, 179,821,432 guilders. The Government exports were 13,560,199 guilders of merchandise, and private exports were 202,996,658 guilders of merchandise and 1,197,240 guilders of treasure; total exports, 217,754,097 guilders. Of the exports, with the exception of rice, half of which goes to Borneo and China, about 80 per cent. are shipped to Holland. In Dutch Borneo are diamond fields containing gems of purer water than those found in South Africa. The mining company holding the concession made an agreement with the De Beers corporation of Kimberley that it would take out no diamonds for a certain term of years in return for a fixed annual payment of money. In 1901 this agreement ran out, and the Dutch company began the working of its diamond fields at Martapura.

The number of vessels entered and cleared at the ports of the Dutch East Indies during 1898 was 4,164, comprising 168 sailing vessels, of 86,730 tons and 3,996 steamers, of 1,574,238 tons.

The length of railroads in operation on Jan. 1, 1899, was 1,272 miles, and their receipts for 1898 were 15,759,000 guilders. The number of internal letters that passed through the post-office in 1898 was 8,672,352; of newspapers, periodicals, circulars, and samples, 6,370,780; of foreign letters, 1,512,289. The length of telegraph-lines at the end of 1898 was 6,833 miles, and the number of messages sent during the year was 637,389. The three chief cities have been connected by telephones since 1896.

The military policy in Achin was changed in 1898 for one more vigorous. While the Dutch acted on the defensive they were exposed to frequent surprises on the part of the enemy. Although they succeeded in repelling attacks, the subjugation of territory proceeded slowly. When they assumed the aggressive again and adopted the method of exhausting the Achinese rebels by incessant sudden incursions into their territory they made rapid progress in the interior and gained possession of the valley which connects northern Sumatra with the eastern coast, which has been the field of their latest operations. They captured 7 important positions without suffering any loss, the garrisons retiring in every instance on being taken by surprise. Batoeilik, a strong fortress, was the only place that still held out. It was regarded by the natives as impregnable. Early in 1901 a strong expedition was sent into Samalanga which captured Batoeilik by storm with a loss to the Dutch of 6 men killed and 4 officers and 36 men wounded, while of the Achinese 70 fell. The Dutch followed up their victory, the moral effect of which was apparent in the weakened resistance of the rebels. Early

in March the Dutch troops stormed Pajaruebec, on the west bank of the Pedri, killing 77 Achinese and driving the rest into the river, in which many were drowned, themselves losing 2 killed and 8 wounded. The rebellion was practically ended by this success as far as it was organized and conducted by the leaders who had long defied the Dutch. In the beginning of August the claimant to the sultanate of Achin was discovered in his hiding-place and wounded in effecting his escape.

Guiana.—Dutch Guiana, or Surinam, is administered by a Governor, assisted by a Council of official and nominated members and in legislative matters by the colonial States, part elected and part appointed for each session by the Governor. W. Touckens was Governor in 1901. The colony has an area of 46,060 square miles and a population estimated in 1898 at 66,490, not counting tribal Indians and the forest negroes, descended from runaway slaves, numbering about 12,000. Paramaribo, the capital, had 31,200 inhabitants. Among the population of the colony in 1896 were 9,698 Hindus and 2,681 Mohammedan East Indians. There were 1,250 Jews. Moravian Brethren form the great majority of the Christian population. The revenue collected in the colony in 1900 was 2,296,000 guilders, which was supplemented by a contribution of 128,000 guilders from the Dutch Government to meet the expenditure, amounting to 2,424,000 guilders. The garrison in 1898 was 19 officers and 327 men, and the local militia and civic guard number about 90 officers and 2,000 men. There are 8 sugar plantations, covering 1,704 hectares, which produced 1,217,798 kilograms in 1898. The cacao plantations, numbering 78 and having a total area of 13,960 hectares, produced 2,706,338 kilograms. The yield of bananas was 532,096 bunches. Of coffee 389,389 kilograms were produced; of rice, 136,270 kilograms; of corn, 345,342 kilograms; of rum, 1,057,601 liters; of molasses, 1,545,460 liters. There were 351 concessions for gold-mining granted up to the end of 1898, and in that year 864,990 grams of gold were shipped, value 1,136,606 guilders. The total value of imports in 1898 was 5,703,427 guilders; of exports, 5,211,323 guilders. The number of vessels in the foreign trade entered during 1898 was 273, of 143,938 tons; cleared, 271, of 142,004 tons. Another Dutch colony in America is the island of Curaçao (see WEST INDIES).

NEVADA. (See under UNITED STATES.)

NEW BRUNSWICK, an eastern province of the Dominion of Canada; area, 28,100 square miles; population in 1901, 331,093. Capital, Fredericton.

Government.—The Liberal Government of 1901 in this province was a continuation of that formed by the Hon. A. G. Blair on March 3, 1882. Upon accepting the post of Minister of Railways and Canals at Ottawa, Mr. Blair was succeeded, on July 17, 1896, by the Hon. James Mitchell, and upon the latter's retirement, on Oct. 29, 1897, the Hon. H. R. Emmerson became Prime Minister. On Aug. 31, 1900, Mr. Emmerson retired in order to enter Dominion politics, and was replaced by the Hon. Lemuel John Tweedie. The Conservative minority in the house was very small. The Government at the opening of 1901 stood as follows: Premier and Provincial Secretary and Treasurer, L. J. Tweedie; Attorney-General, William Pugsley, K. C.; Surveyor-General, A. T. Dunn; Commissioner of Public Works, C. H. Labilloy; Commissioner for Agriculture, L. P. Farris; members without office, S. H. Hill and H. A. McKeown.

Legislation.—The third session of the thirty-first Legislature of New Brunswick was opened

by Lieut.-Gov. the Hon. A. R. McClellan on Feb. 28. Sombre drapings in the Chamber indicated the mourning of the people's representatives for their late sovereign. The speech from the throne was a long document, of which the most significant portions were these:

"The prompt and effective assistance given by Canada in the South African struggle has shown in a very practical way the loyalty of the people to the British Crown and policy; and we can not fail to notice the fact that the conduct of our own provincial volunteers has been so favorably recognized and appreciated.

"The subject of technical education, involving instruction in agriculture, mining, and the mechanic arts, in respect to which the Legislative Assembly gave authority to enter into arrangements with the governments of Nova Scotia and Prince Edward Island, has during the recess engaged the earnest attention of my Government. After very careful consideration, it has been concluded that the establishment of a school, properly equipped, for the purpose of giving instruction in mining and the mechanic arts, would involve an expense which, with the limited resources of the province, it is not advisable to undertake. My Government has felt it desirable, however, that provision should be made for the establishment of a school of agriculture and horticulture, and a definite understanding has been arrived at with the governments of Nova Scotia and Prince Edward Island in reference to this subject, the details of which will be submitted to you. I think you will agree with me that this project is of great importance, because of the fact that the permanent prosperity of our province depends largely upon its agricultural development. With the generous assistance of the Legislature in the past, a great deal has been done for the improvement of our farming population, the policy of encouraging the dairying and other agricultural industries of the province having resulted in the greatest possible benefit; and you may rest assured that the same vigorous and progressive policy which has been pursued in the past in this direction will be continued.

"In accordance with the desire which has been shown by the Legislature to encourage the establishment of cold-storage warehouses at central points in the province, my Government has given the subject very careful consideration, and it is intended to submit for your approval a measure which will insure the immediate erection at the port of St. John of a large and thoroughly equipped cold-storage warehouse, and which, it is also hoped, will lead at an early day to the establishment of smaller warehouses in various sections of the province.

"The recent scarcity of coal, and the great increase in price, have directed the attention of my Government to the possibility of developing the valuable coal areas lying in the counties of Queens and Sunbury; and a measure having this end in view will be submitted for your consideration.

"The law relating to the great roads and by-roads of the province has not been found entirely satisfactory, and you will be asked to consider whether it would not be desirable to adopt a system which will abolish the distinction between the two, and thus enable all the important highways of the province, irrespective of whether they may have formerly been on the list of great roads or by-roads, to be maintained in proper condition.

"During the past year the financial resources of the province have been taxed to an unusual extent by reason of the smallpox epidemic, which

called for immediate and effective measures on the part of my Government and the provincial Board of Health, as well as the local boards in various sections of the province. I am happy to say that the energetic measures which have been prevented the spread of the epidemic, and for this reason to believe that it will soon be effectually stamped out.

"During the year my Government was called upon to assist the sufferers by a disastrous fire which occurred in the village of St. Martins, in the county of St. John; and also a number of families which were deprived of their support by the terrible loss of life which occurred among the fishermen in the county of Gloucester through the violent storms which prevailed in the Gulf of St. Lawrence during last autumn. It is hoped that the steps which were taken by my Government to assist in relieving as far as possible the suffering caused by these disasters will meet with your approval. The Board of Works was called upon during the past year to incur an extraordinary outlay, by reason of great damage caused to many roads and bridges throughout the province by the unusual freshets. A statement of these extraordinary expenditures will be laid before you.

"Certain irregularities and wrongdoing which have occurred in connection with the list of non-resident voters of the parish of Rothesay, in the county of Kings, have made it necessary that legislation should be enacted to provide for a proper and legal list and to prevent the occurrence of such evils in the future. A measure having this end in view will be submitted for your consideration.

"In opening the last session of the Legislative Assembly, it afforded me great pleasure to convey to you the information that the claim of the province against the Dominion arising out of the Eastern Extension Railway matter, and which had been so long in controversy, had by agreement between the two governments been referred to three competent and disinterested persons, mutually chosen, for final adjustment and settlement. And it is now my pleasing privilege to inform you that the award of the arbitrators has been made, and that it recognizes the justice of the claim which the province has for so many years been pressing upon the attention of the Dominion authorities."

Clifford William Robinson was elected Speaker of the House without opposition. He has been member for Westmoreland since 1897, and was formerly mayor of Moncton. The house adjourned April 3.

Finances.—On March 18 the Hon. Mr. Tweedie presented the annual budget. The receipts of the province for 1900 were \$758,988; the estimates had been \$745,191. The chief increase was in the succession duties, which realized \$39,522. The Dominion subsidies amounted to \$483,491; the territorial revenue was \$175,818; the taxes upon incorporated companies realized \$25,352; the liquor licenses brought in \$21,628. The expenditures totaled \$794,476, showing a deficit of \$35,488. Against this, however, were the unusual expenses of \$24,000 in connection with the suppression of smallpox, the \$5,000 spent on the South African contingent, and \$10,484 expended on the bridge inquiry. The net debt of the province on Oct. 31, 1900, was \$2,851,068, as against \$2,736,298 in the preceding year. The increase during the year was, therefore, \$114,788. For 1901 Mr. Tweedie expected better returns, and estimated the revenue at \$1,030,491 and the expenditure at \$808,424. Included in the revenue estimates were \$483,491

for Dominion subsidies, although this figure might be increased as a result of the census; \$270,000 for the Eastern Extension claim and final payment; taxes on incorporated companies, \$25,000; succession duties, \$25,000; liquor licenses, \$21,500; miscellaneous, \$20,500. The estimated expenditures included \$17,525 upon the administration of justice; \$34,526 upon agriculture; \$206,494 upon education; \$30,070 upon executive government; \$124,000 upon the interest on bonded indebtedness; \$8,000 on immigration; \$11,000 upon public health, and the same amount on public printing; \$20,327 upon the Legislature; \$61,543 upon lunatic asylums and \$7,600 upon public hospitals; \$296,077 upon public works; miscellaneous expenses, \$38,300. Mr. Tweedie concluded his speech on March 19 with a declaration that the province was in a good financial condition.

James K. Fleming replied in behalf of the Opposition. He declared that it had become the custom to claim a surplus year by year, whether there was one or not. On this occasion, however, the Premier and Provincial Secretary had to admit the deficit, though he tried to excuse it by practically declaring that the finances were in such a shape that the slightest outside call would create indebtedness. He pointed out the steady increase in expenditures from \$727,186 in 1897 to \$794,476 in 1900, and asked how this was going to be met. Even with this increase, the great public interests were being starved. Education received this year \$4,044 less than in 1897, and public works received only \$2,000 more than four years previously. So with agriculture, which showed an increase in that period of only \$4,864. Meanwhile the revenue had only risen from \$745,212 to \$758,988—a much smaller increase than was shown in expenditures. The revenue from lumber cut on the Crown lands had, it was said, increased from \$96,264 in 1899 to \$112,315, but he believed that in the following year the lumber cut would be about one-third less, and the estimate of \$100,000 from this source was therefore excessive. Mr. Fleming then dealt with what he termed the Government's system of direct taxation—succession duties, liquor licenses, taxes on banks, fire and life insurance companies, accident companies, telegraph, telephone, and loan companies, street-railways, etc.—amounting to \$91,282. He did not think that this money came out of the pockets of rich corporations, as the Government said. The banks took it out of their customers and the insurance companies out of their policy-holders. The people really paid their taxes. As to the public debt, he declared that at the present rate of increase the interest charge in four years would amount to \$16,695. He criticized the salaries and additional sums paid to ministers, and declared that if the present system of open corruption in the construction of street bridges—which the Opposition had so long urged—had been previously adopted, \$35,000 would have been saved in the past four years.

The Rothesay List.—One of the most discussed political questions in the Legislature and the province in 1901 was an apparent attempt to stuff the voters' list of the parish of Rothesay in Kings County. Under the New Brunswick franchise act, non-residents who own \$100 worth of real estate in any constituency are entitled to a vote, and early in the year it was found that 406 names had been added to the list of non-resident voters for Rothesay. Nearly all the names were said to be those of Government supporters, and many of them said, as soon as the matter became public, that they did not own any property in Kings County, had not applied for

registration, and did not know they were registered as voters. The names were listed by three revisers, one of whom declared that their signatures to this list were taken from a genuine one prepared by two of them and attached to the fraudulent one by the third reviser without the knowledge of the other two. The Conservative papers took up the matter in terms of strong denunciation, and endeavored to connect the party organizers and the Government with it. They pointed out that no property changes appeared to have taken place in Rothesay during the year, and that if they had it would have been hard work to find \$40,000 worth of unimproved land in the parish.

On Feb. 22 the subject came before the provincial Supreme Court at Fredericton, and the fraudulent electoral list was unanimously quashed. One effect of this judgment was to sweep away both the spurious and the genuine list and leave Kings County without a member for the ensuing session of the Legislature. The Attorney-General at once announced that legislation would be introduced to remedy the wrong and to prevent its repetition.

Steel Ship-building.—In the early part of the year St. John followed the example of Halifax in discussing and encouraging the establishment of this industry. Members of the city council met the promoters of a local company and the papers spoke warmly in favor of the project. On March 5 Mayor Daniel informed the council that among the promoters was J. H. Thomson, of William Thomson & Co., of St. John, who had confidence in local facilities for this industry. He understood that \$100,000 had already been subscribed in St. John for a new company. Their proposed policy was to have a shipyard in which 4 large vessels could be constructed at one time and in a single year. The number of men employed would be 1,500, and the estimated expenditure per vessel about \$240,000. Speaking in Montreal, on March 19, Mr. Thomson declared that during the last five years his firm had built upon the Clyde 9 steamers of the Ballie line and had 5 more under construction. This represented nearly \$3,000,000 expenditure, of which 95 per cent. was Canadian money. The Clyde firms were behind the Americans in speed, and the industry could be carried on better at St. John. Harry Harding, of St. John, one of the most active promoters of the new project, was also interviewed at Montreal. He declared that the capital of the new company would be \$3,000,000, that its location would depend upon the encouragement given locally, and that it was not impossible that the requirements of the near future might justify a plant at Halifax, one at St. John, and another at Sydney. Finally, the city council decided to offer aid to the extent of \$100,000, a free site, and exemption from taxation, to any company engaging in the business of building steel ships in that city. The Legislature was asked for the power to make these arrangements, and this was granted subject to a limitation of the right to manufacture engines and machinery to the requirements of the company for their own vessels.

Railways.—On March 5 the Hon. Mr. Tweedie introduced a measure in the Legislature for the construction of a line of rail in the counties of Queens and Sunbury, running from the terminus of the Central Railway, at Chipman, to a point opposite Fredericton, on St. John river. The object was to enable the large areas of coal in these localities to be developed. The Government undertook to guarantee the principal and interest of the first-mortgage bonds of any company au-

thorized to construct such a line, the amount not to exceed 55 per cent. of the actual cost of the company's railway, rolling-stock, and plant, and limited in amount to \$250,000. The rate of interest was not to exceed 3 per cent., and no part of the guarantee was to be paid until the road was completed and properly equipped. The net profits were to be applied to the interest on the bonds and the creation of a sinking-fund. The company was to establish on the line of railway a plant for mining coal capable of producing an average of not less than 500 tons a day. All railway companies hereafter receiving subsidies from the province were, the Premier declared, expected to bind themselves to use New Brunswick coal if obtainable at reasonable prices. The Government was further authorized under this enactment to impose a tax on the company and upon all other railway companies to an amount not exceeding 3 per cent. of their gross yearly earnings made within the province, and less any Government royalty paid on the coal consumed by the railway or industries established along its line. The guarantee was to be made subject to the Government being satisfied that 150,000 tons per annum could be mined in this region; the railway was to pay a royalty of 10 cents a ton on all coal mined on granted lands and 15 cents a ton on coal mined on Crown lands; the contract was to be entered into before Jan. 1, 1902.

Other legislation in this direction was the assistance given to 3 roads which were said to be much needed. One ran from Shediac to Cape Tormentine; another ran from Foreston, on the Canadian Pacific Railway, in Carleton County, and was intended to reach the headquarters of the Miramichi, and thus give a stimulus to lumbering and milling operations; the third was from a point on the St. Francis branch of the Temiscouata Railway, running to the Quebec boundary and forming part of an ultimate through trunk line from western seaports to the Maritime Provinces. To this Quebec and New Brunswick railway grant two important conditions were attached. New Brunswick coal was to be used upon the entire system.

Mines.—In his official report for 1900, issued toward the end of the year, A. T. Dunn, Surveyor-General of the province, declared that greatly increased interest was being shown in the mineral development of New Brunswick. The Intercolonial Copper Company, at Dorchester, had been specially active, a large quantity of ore had been mined, and substantial buildings erected. Recent investigation had shown their copper to be of very great extent. The coal resources of the province had received close attention from the Government, and investigations were going on in various directions. So with oil explorations and manganese mining. The amount received from mining licenses during the year was \$2,576. The official figures of the Government, published in 1901, showed a production of 10,000 tons of coal in New Brunswick in the previous year and an export of only 107 tons. The import of coal from Nova Scotia was at the same time 455,301 tons. There was \$145,850 worth of gypsum produced in the year.

Education.—The official figures regarding education in New Brunswick, as given by the Dominion statistician in 1901, put the number of schools in the term ended June 30, 1900, at 1,771, a decrease of 44; and the teachers numbered 1,856, the pupils 61,444, and the average attendance 37,529. The teachers in the grammar schools were 35 in number, and the pupils 946. In the

normal schools there were 201 female pupils and 55 male. The Government grant for the year was \$194,112, the aid given by municipalities amounted to \$90,361, and the assessment upon school districts was, approximately, \$100,000. This indicated a total revenue for the purpose of \$631,372. The total expenditure was \$605,184. In the Legislature the most important matter during the year in this connection was a grant to the University of New Brunswick in aid of its new science building.

Agriculture.—On March 20, L. P. Farris, Commissioner for Agriculture, reported to the house upon various matters connected with that interest. Three new agriculture societies had been organized in the year 1900, making the number 59, with a membership of 4,539 and subscriptions of \$6,361. Six new roller-mills had been erected, making a total of 19. Of wheat, 504,301 bushels had been grown at an average slightly over 18 bushels to the acre. The oat crop also showed an increase over the preceding year, and the total production was 5,281,690 bushels, or an average of 29½ bushels to the acre. The cheese factories in operation were 54, making 1,882,432 pounds of cheese at a value of \$189,706—an increase of \$32,200 over the preceding year. There had been 33 butter factories in operation, producing 462,606 pounds, valued at \$94,618. This was also an increase—\$36,124 in amount. The value of cheese and butter exported was \$170,000, out of \$284,324. There had been 73 meetings of farmers' institutes, attended by 10,322 persons. It was now proposed to extend the work of these associations. The house then passed in committee \$2,500 for institute meetings, \$4,500 for the encouragement of dairying, and about \$3,000 for specified agricultural purposes.

The official report of Mr. Farris for 1900 contained a large amount of information in this connection, and was issued at Fredericton under date of Jan. 1, 1901. The commissioner began by reporting "a successful year for every branch of industry," and that the province "seems to be in the most prosperous condition it has been in for years." The South African War had brought a great demand for hay and oats at fair prices, and cheese and butter found a ready market in England. In fact, since the opening of the war "every manufacturing industry in Canada making goods wanted by England has had a preference over other countries." Buckwheat had been a light crop for two successive years, and fruit-raising had been steadily developing. The increase in the output of pork-packing establishments had been marked, and every effort was being made to encourage the production of the bacon hog as bringing a better price than heavy pork. More attention had been given to the hitherto neglected matter of poultry-raising, and chicken-fattening stations had been formed in different parts of the province.

Public Works.—According to the report of the Commissioner of Public Works, issued in March, the expenditure upon main roads and bridges in 1900 was \$93,067; upon by-roads, \$68,345; upon permanent bridges, \$65,499; upon legislative and other buildings, \$8,354. The total expenditure of the department was \$254,906. The main roads of the province covered 2,345 miles. The report of the Surveyor-General showed receipts for 1900 amounting to \$175,818, of which the renewed timber licenses totaled \$37,028, the stumpage dues were \$112,315, the fishing licenses \$8,822, and the hunting licenses \$8,266. According to a statement made in the Legislature on March 11 by the Hon. Mr. Tweedie, the total

amount of bonds issued for permanent bridges in the province was \$729,280.

NEWFOUNDLAND, colony of, an island near the Atlantic coast of Canada, owning allegiance to Great Britain but possessed of full self-government. The population is about 210,000; the area, 42,200 square miles besides a stretch of the Labrador coast. Capital, St. Johns.

Government and Politics.—The Governor is appointed by the Crown; the ministry consists of 7 members, the Legislative Council of not more than 15, appointed for life, and the House of Assembly of 36 members elected by manhood suffrage vote every four years. The general elections of Nov. 8, 1900, turned upon a railway contract entered into with R. G. Reid, which made him practical owner of the railway system of 640 miles, the telegraph system of 1,000 miles, and the great dry dock at St. Johns, as well as of the mail steam subsidies for thirty years, 4,500,000 acres of the best lands in the colony, and the electric tramway, light, and power franchises of St. Johns. These interests Mr. Reid proposed to hand over to a joint-stock company with \$25,000,000. Mr. Bond, the Liberal leader, objected to such great powers being given away, and had succeeded in defeating the Government of Sir James Winter. He had formed a ministry on March 8, and at the general elections he won by a large majority. On Dec. 7 his Government was reconstructed as follows: Premier and Colonial Secretary, Robert Bond; Minister of Justice, William Horwood; Minister of Finance, E. Jackman; Leader of the Legislative Council, George Knowling; members without office, E. P. Morris, Augustus Harvey, James Pitts, Henry Woods, James D. Ryan. Eli Dawe, Minister of Agriculture, Thomas Murphy, Minister of Fisheries, and George Gushue, Minister of Public Works, were members of the Government, though not in the Cabinet. An early event of the year was the transfer of Lieut.-Col. Sir Henry E. McCallum, K. C. M. G., the popular Governor of Newfoundland, to Natal. He was succeeded by Sir Cavendish Boyle, K. C. M. G., lately Administrator of British Guiana. The latter arrived at St. Johns on June 16. Meanwhile the first session of the nineteenth General Assembly of Newfoundland was opened by Gov. Sir H. E. McCallum, on Feb. 22, with a speech from the throne, of which the following was the significant portion:

"The temporary act for giving effect to the treaties between Great Britain and France in relation to fishery rights on a portion of the coast of this colony expired on the 31st day of December last. The Secretary of State for the Colonies has invited my ministers to send a delegation to London to confer with his Majesty's Government on the subject of the treaty question preparatory to the opening of negotiations by his Majesty's Government with the Government of France, with a view to a final settlement of the matters in dispute. My ministers have complied with the invitation. Pending the negotiations, his Majesty's Government asks that your Legislature continue the present act for the ensuing season, and I have, upon the advice of my ministers, summoned this session for the special purpose of submitting the matter for your immediate consideration."

The proceedings of the session were very brief. Mr. L. O'B. Furlong was elected Speaker of the Assembly, and an address to the King was passed by both houses expressive of loyalty to the sovereign, pride in the empire, deep regard for the memory and life of Queen Victoria, and pleasure in the coming visit of the heir apparent and his wife. The *modus vivendi* bill reenacting the legis-

lation regarding the French shore treaties was passed. On Feb. 25, A. B. Morine, K. C., leader of the Conservative Opposition, moved the following resolution:

"Whereas, The leader of the Government, in his manifesto prior to the late general election, pledged his supporters to a reduction of customs duties on imports; and Whereas, The current revenue of the colony exceeds its current expenditure; and Whereas, The rate or duty of 10 per cent. on certain customs duties was enacted and levied at a time when the expenditure of the colony exceeded its revenue, and only for the purpose of avoiding a deficit, which desirable object it accomplished; and Whereas, Any reduction of duties, to have full beneficial effect upon the people of the colony in this present year, should operate upon the spring importations; Resolved, (1) That in the opinion of this house a measure reducing certain customs duties should be enacted; (2) that the rate of 10 per cent. on duties should be abolished; (3) that the duty on molasses should be reduced by 5 cents a gallon; and (4) a prorogation or lengthened adjournment of the Legislature, prior to the enactment of reductions, will be regarded as a breach of faith with the electors."

Mr. Morine denounced the Government for breaking pledges, and urged other arguments in favor of his motion. It was defeated, however, by a vote of 23 to 3. On Feb. 28, Sir H. E. McCallum prorogued the Legislature.

The regular session was opened on May 23 by Chief-Justice Little, with a speech from the throne, of which the following were the important passages:

"Since the session of the Legislature last year a general election has taken place, and has resulted in a very strong announcement in favor of the policy of my Government.

"During the past year our fisheries have been prosecuted with a large measure of success. The shore codfishery resulted in a full average in quantity, and it is gratifying to know that the cure was better than usual. The Labrador fishery, on the other hand, resulted in a smaller catch than in either of the two previous years, principally owing to the presence of ice to a very late period on the coast, which not only prevented the crews from fishing during what is usually the most productive part of the season, but also destroyed a great deal of fishing gear, thus depriving the fishermen of the means of catching fish even after the ice had finally left the coast. The price of codfish opened satisfactorily and continued exceedingly good in most of our foreign markets, and thus contributed toward what may be considered, on the whole, a prosperous year's business. The seal fisheries of 1900 and 1901 were very successful. The lobster fishery appears to be gradually failing, and from the experience of other countries, as well as our own, it would appear as if this fishery will be entirely destroyed, unless some more vigorous measures than we have heretofore tried be adopted for its protection. The prices realized were high during the whole season, but the quality of the pack left much to be desired and reduced considerably the total value of the catch. The salmon fishery, compared with recent years, proved an average one, but as an article of trade our salmon is being driven out of foreign markets by the Pacific coast salmon. The latter, though a much inferior fish for table use because of its coarseness and toughness, is enabled by these very qualities which cause its inferiority to better withstand the rough handling incident to its transportation by land

and sea. The herring fishery on the coast of this island was one of the smallest on record.

"Agricultural operations resulted satisfactorily, and the crops were well above the average.

"Owing to the strike at Bell island in the summer of last year the quantity of iron ore exported from that place fell much short of the export of the previous year. The products of our mines generally, however, while not equal in value to those of the year immediately preceding, were in advance of those of previous years, and yielded handsome returns.

"The exports of lumber last year showed a marked increase, and during the present year lumbering operations are being carried on on a much extended scale.

"The customs revenue for the year ending June 30 last was in excess of the estimate. I have directed the estimates for the year to be prepared and forwarded to you without delay. You will be asked to make suitable provision for the reception of their Royal Highnesses the Duke and Duchess of Cornwall and York when they visit the colony in October next.

"The movement for the establishment of a naval reserve among our fishermen has met with a promising measure of success. During the past year 51 of our naval reservists went into training for six months on board H. M. S. Charybdis, on the West Indian station, and their services and conduct won the appreciation of their commanding officers. In a communication received by me from the commodore, he says: 'We all consider them to be now a useful and efficient body of men, who would be a formidable addition to our personnel. So well have they done that I have been able to advance 40 to the higher rating of qualified seamen.'

"In response to an application made by my ministers, his Majesty's Government has offered to send H. M. S. Calypso, to be permanently stationed here for use as a training-ship for Newfoundlanders who enlist in the Royal Navy Reserve, and arrangements have been made whereby fishermen entering the service can take the prescribed four weeks' period of training during the winter months, so as not to interfere with the pursuit of their ordinary vocations. My Government has dutifully acknowledged the liberality of his Majesty's Government in this matter, and has undertaken to instal a system of steam-heating and to make other necessary internal alterations in the ship required for the accommodation and comfort of our royal reservists.

"My ministers have had under their consideration the question of revising the tariff, with a view to effect such changes as will remove its present inequalities and secure a more equitable distribution of taxation. They hope to be able to submit proposals for such a reduction of the taxes at present imposed on several of the necessities of life as can be made consistently with providing a sufficient revenue for the maintenance of the public service.

"A matter calling for the serious consideration of the Legislature is the increasing scarcity of coal and its consequent advance in price, placing it beyond the means of many of our people. It is highly important that steps should be taken without delay to ascertain as fully as possible the extent and value of our own coal areas, and to this end I trust due provision will be made in the estimates during the present session.

"The question of reciprocity between this colony and the United States of America is receiving the attention of my ministers. At the re-

quest of his Majesty's Government, the Premier of this colony visited Ottawa to discuss with the Government of the Dominion of Canada the grounds of objections that were raised by the latter to separate and distinct negotiations."

The legislation of the ensuing session, which lasted until Aug. 2, included a revenue act, a Crown lands act, a marine court of inquiry act, a quarter-sessions act, the important railway amendment measure, a judicature (amendment) act, a measure relating to education, a convention act relating to property owned by deceased foreigners, an oaths act, a measure relating to life insurance companies, an election (amendment) act, a measure fixing the salaries of district court judges, an inflammable oils act, an intoxicating liquors (amendment) act, and measures relating to the preservation of beavers, the organization of fire brigades, and to customs, pensions, and public finances.

Visit of the Heir Apparent.—The Duke and Duchess of Cornwall and York arrived, on Oct. 23, at St. Johns, the last stopping-place in an empire tour of 50,000 miles by sea and land. The royal yacht Ophir had been convoyed from Halifax by 4 British men-of-war, and St. Johns was found to be profusely decorated, while the harbor was filled with 600 fishing vessels manned by 30,000 fishermen, and all gay with flags and bunting. The first function was a dinner given on board the yacht by his Royal Highness in the evening, at which Gov. Sir Cavendish Boyle, the Premier, and other dignitaries were present. During and after this function the town fairly blazed with illuminations and fireworks, while the warships in the harbor were electrically lighted, 15 sealing steamers moored in a long line glowed with festoons of marine lanterns, and a myriad of other fishing vessels were bright with varied lights. In St. Johns a thousand torch-bearers paraded the streets, while bonfires flamed out from the surrounding hills. The formal reception began on the succeeding day. The Government had obtained a grant of \$15,000, and private citizens had made up a fund with contributions ranging from \$2 to \$2,000. Five arches had been erected in the capital, including a very fine one by Mr. R. G. Reid. At eleven o'clock on the morning of Oct. 24 the royal couple landed, and the procession to Government House took place through streets lined with sailors and marines from the fleet. There an address was presented by Sir W. V. Whiteway, Chairman of the Citizens' Committee, and replied to by the duke. The Governor then presented the people's gift, consisting of two splendid caribou heads, mounted, for his Royal Highness, and two albums containing photographs of natural scenery for the duchess. Lady Whiteway, for the women of the colony, also presented the latter with a handsome mink carriage rug. At the new court-house the duke laid a commemorative stone, and at the Princess Rink the royal couple listened to songs of welcome from 4,300 children and accepted a Newfoundland dog-harness and cart for their own children at home. In the afternoon a reception was held at Government House and 500 citizens were presented, and in the evening Sir Cavendish Boyle entertained the royal visitors at a state banquet. At dawn on the following morning the Ophir steamed away for England.

The Reid Contract.—The central event of 1901 in the colony was the settlement of the relations existing between the Government and Mr. R. G. Reid in connection with the latter's railway contract and practical monopoly of island transportation interests. For several years the rail-

way interests of Newfoundland had been a difficult problem to the Government. They had spent \$13,000,000 on a transinsular line, and had found that the cost of operating the line was \$300,000 in excess of its revenue, while interest on the construction debt was also piling up. This situation the island finances could not bear, and in 1898 Sir James Winter carried through the Legislature a contract with Mr. Reid, by which the latter acquired all the railways in the colony on payment of \$1,000,000, and also took over the Government telegraph-lines. He was to have control of the St. Johns dry dock and of various other shipping or transportation concerns and 3,000,000 acres of land. The latter, however, he was to sell to settlers at 30 cents an acre. In return, he undertook to run daily trains across the island, a first-class steamer between Sydney, C. B., and Port Aux Basques, another between Newfoundland and Labrador, and 7 others in the great bays of the island. At the end of fifty years' efficient carrying out of this agreement the railway was to become his property. This contract was protested against by Mr. Chamberlain, and was bitterly opposed by a section of the Liberals under Mr. Bond. Another section under Mr. Morris took no part in the contest. The elections of 1900 resulted in Mr. Bond's return to power and a coalition with Mr. Morris. The contract came into the legislative arena again through a clause that prevented Mr. Reid from assigning his rights over the railway without the Government's consent. This Mr. Bond refused to give without a consideration, and thus the contractor found himself unable to organize the company with \$25,000,000 which he had under way and with which he hoped to develop very large interests of various kinds in the island. Meanwhile the Premier went to England in March, and, with the assumed approval of Mr. Chamberlain, who had previously supported the right of the colony to take possession of its property again after duly compensating Mr. Reid, had a bill drafted to legislate away the latter's monopoly. The terms then presented to the contractor were, that he should agree to resign his proprietary rights in the railway; that he should restore the telegraphs to the ownership of the Government; and that he should consent to various modifications of his land grants in the interest of the squatters. These he refused, and seven months were spent in negotiating. Finally an arrangement was reached, and it received the sanction of the Legislature. Under its terms the colony recovered its fee simple to the railway, the telegraphs, and the land. To resume ownership of the railway Mr. Reid was paid back the \$1,000,000 originally paid by him, together with three years' interest at 6 per cent. His operating control he was to carry on for fifty years, as before, but as a contractor and not a proprietor. For surrender of the telegraphs he received the right to string a wire of his own, for use in his business. For the surrender of the lands he was paid \$850,000, or 27½ cents an acre. The service on the railway was to be improved, all expenses for stock and equipment were to be borne by the company or Mr. Reid, and at the end of fifty years the Government was to take possession at a valuation. The right to transfer his holdings to a stock company was given. He also undertook to use the \$5,000,000 which he expected to raise upon mortgages in the development of these properties and concessions, and to deposit \$250,000 with the Government as a guarantee. He was to fence the railway tract at a cost of about \$100,000, perfect the railway line at an estimated expense of

\$250,000, build hotels, pulp-mills, and other concerns, and encourage immigration.

By this settlement the Government got back a railway that had cost \$10,000,000 and been sold for \$1,000,000; reassumed possession of lands that included 495 miles of coast-line and thousands of acres of farming, lumbering, and mining lands; and revived the credit that had been so disastrously affected by the contract of 1898. In concluding his presentation of the agreement to the Assembly, early in August, the Premier spoke very highly of Mr. Reid. The latter at once set to work to organize his company, and in October the first general meeting of shareholders in the Reid Newfoundland Company was held in London. The capital stock was announced as \$25,000,000, with all the stock taken fully paid up and a large cash credit available in the bank.

Finances.—Early in July the Hon. Edward Jackman presented his budget to the assembly. The revenue for the fiscal year ending June 30, 1900, was \$2,111,637; the expenditure was \$1,853,034; the surplus was \$258,603, to which must be added that of the preceding year, or a total of \$316,695. The probable revenue for the year ending June 30, 1901, was \$2,000,000, and the expenditure was placed at the same figure. The estimated revenue for the year ending June 30, 1902, was \$2,060,000, and the expenditure was placed at \$2,030,000. The Finance Minister was greatly pleased with the prosperous condition of affairs in the years under review. Toward the end of September the excellent credit of the Government was illustrated in the floating of a loan in London. This amount of \$2,000,000 was subscribed for three times, and was obtained on most advantageous terms. It was a 3½-per-cent. loan, for which 94 was paid, the principal repayable in fifty years.

The public debt on June 30, 1900, was \$17,376,774.

Trade and Commerce.—In 1900 the trade of the colony improved greatly and became the most prosperous in its history. The imports were \$7,497,147, an increase over the fiscal year 1899 of \$1,185,903. The exports were \$8,627,576, an increase of \$1,691,261. Of the former, \$2,224,353 came from the United Kingdom in 1900, \$3,102,604 from the British possessions, \$2,170,190 from foreign countries. Of the exports, \$1,942,093 went to the United Kingdom, \$1,802,515 went to British countries, \$4,822,968 went to foreign countries. Canada shared in the island's imports to the extent of \$2,805,490, and received of its exports \$520,137. The United States sent \$1,993,505 worth of products, and received \$1,005,525 worth. Of the exports, the chief product was that of the fisheries—\$7,015,964. The chief imports included fresh meats and poultry, \$1,366,675; molasses, \$260,489; pork, \$308,094; tea, \$147,979; leather, \$216,516; hardware, \$181,462; leatherware, \$111,443; woolens and cottons, \$653,615; ready-made clothing, \$305,296; coal, \$302,889; cordage company material, \$142,359; specie and bullion, \$261,160; mining machinery, \$81,794.

Fisheries.—The staple interest of the Newfoundland fisheries is the cod. In the fiscal year 1900 the catch was 1,300,622 quintals, valued at \$5,453,538, against a product in 1899 valued at \$4,445,031. Codfish oil was sold to the value of \$301,515, and cod-liver oil to the extent of \$8,598. The seal fisheries returned \$433,605 for seal-oil and \$162,330 for sealskins—a total of \$595,935, against \$388,599 in 1899. The lobster fisheries produced 37,523 cans, worth \$441,202, in comparison with 56,166 cans, worth \$565,362, in 1899, and 61,951 cans, valued at \$619,510, in the preceding

year. Mr. Bond, the Colonial Secretary, says that "the rigid enforcement of the regulations governing this industry, especially those against the taking of undersized fish, seems to be the only hope of saving this valuable fishery from total depletion." The herring fishery also showed a decrease from \$245,869 in 1899 to \$200,989 in 1900, due partly to the mildness of the weather and consequent difficulty of freezing the fish. The salmon catch had improved—largely owing to the fishing on the Labrador coast—from \$61,578 in 1898 to \$73,478 in the succeeding year and \$103,698 in 1900.

Education.—The expenditure upon schools in the fiscal year 1900 was \$158,151, the number of schools open was 699, and the pupils on the rolls numbered 36,591—a slight increase in each case over the preceding year. The educational system is on a basis of religious interest, each denomination receiving a Government grant in proportion to its numbers. Separate boards of education have charge of the elementary schools in the different districts, and 4 superintendents of education—Roman Catholic, Church of England, Methodist, and Presbyterian—are appointed by the Government. There is a council of higher education of 23 members, with the superintendents and head masters of colleges as members *ex officio*. In 1900 the Church of England board schools, private-aided schools, and colleges numbered 254, with 13,148 pupils and Government contributions of \$39,677; the Roman Catholic institutions numbered 228, with 12,612 pupils and Government contributions of \$49,843; the Methodist institutions numbered 212, with 10,562 pupils and Government contributions of \$35,847; the Presbyterians had simply 1 college, and the Congregationalists 4 schools. The school fees and voluntary contributions amounted only to \$31,000 all told. Of this total, the Methodists contributed more than \$14,000.

The French-Shore Question.—This problem involves the peace and prosperity of Newfoundland to some extent, the question of its union with Canada, the welfare of its fishermen, and a prominent feature in the diplomatic relations of France and England. By the treaty of Utrecht in 1713 certain fishing privileges were given to the French upon a portion of the Newfoundland coast; by the treaty of Paris in 1763 France received St. Pierre and Miquelon islands, and thereafter built up a rival fishing interest, through the bounty system, to that of England; the King's declaration in 1783 guaranteed the non-interference of British fishermen upon the French shore. Since that time continuous irritation and trouble have been caused by French aggression on this debatable land, and the very natural retaliation by British fishermen. In 1891 came the *modus vivendi* by which the Newfoundland Legislature gave the commanders of British ships practically autocratic power for the protection of French rights on the coast. This was renewed yearly, pending a settlement of the whole affair with France. In 1900 the *modus vivendi* act was renewed without protest, because of the South African War, and toward the close of the year Mr. Chamberlain asked for its renewal once more. Six years ago 1,200 Frenchmen were employed in this industry, and to-day there are only 500, while in connection with the lobster fisheries, which are also protected under the act and therefore provisionally recognized as French, the Newfoundland fishermen are forbidden to set up their lobster canneries. Yet "the right to catch lobsters and to establish canneries on the Newfoundland coasts can not be maintained under the

stipulations of the treaties of Utrecht and Versailles," which dealt only with food fish. On Jan. 11, the Paris Temps, referring to the suggestion that British Gambia, on the western coast of Africa, should be exchanged for French rights in Newfoundland, quoted the words of Lord Salisbury, two years before, declaring that those rights were "incontestable and uncontested." It then pointed out that the exchange was not desired by French-African merchants, and that the cod might again return to the inshore fisheries and restore their value. Yet it was admitted that conditions had greatly changed since the rights on Newfoundland were first given.

"Only imagine what our own sentiments would be if the fishing rights on the coast of Normandy belonged to the English and not to our fellow countrymen. Consequently, on our part, we think it is right for France not to show herself intractable if she be requested to lend herself to an arrangement to correct what the progress of time has rendered abnormal. Yet there must be no question of inverting the rôles. On our side we have no sort of need to modify the existing situation. We must, then, not be expected to be disposed to bear the cost of the modification."

When the special session of the island Legislature met in February in order to pass the *modus vivendi* act for another year, the discussion was limited. The measure then passed its various stages without opposition, though not without a wide-spread feeling that the renewal could not be continued much longer.

Reciprocity with the United States.—The old question of the Bond-Blaine treaty was reviewed this year. P. P. McGrath, editor of the St. Johns Herald, writing on Oct. 26, said: "That instrument was framed with a view to admitting the Americans to free baiting and cognate privileges in our waters, in return for free entry of our fish and crude minerals to their markets, and was based upon a clear principle and understanding of the relative merits of the two parties to it. Canada was not included, because the Americans felt that to include her was to destroy themselves." Practically, it was said, the proposed treaty—which the Dominion persuaded the Imperial Government to veto—would create a preference for American fishermen in Newfoundland or British waters over Canadian fishermen. This is better understood from the fact that the maritime province fisheries employ about 2,300 vessels and 46,000 persons, and yield \$12,000,000 worth of products, while the New England competition fisheries, which would have benefited under the proposed conditions and from whose American market the Canadian fish were excluded, employ about 1,400 vessels and 35,000 persons, with a yield valued at \$9,600,000. Mr. McGrath, however, denied that there would be any preference against Canada. "Our fish would be admitted to United States markets on better terms than Canada's, but no more stringent regulations would be enforced against Canada than now."

Statistics.—The Newfoundland savings-banks in the year ending Dec. 31, 1900, had 3,747 depositors, a total deposit of \$1,304,216, and invested funds amounting to \$1,256,070.

The letters and post cards dealt with in the fiscal year 1899-1900 numbered 1,700,000, the newspapers, etc., 2,760,000, and the parcels 20,171. The revenue of the post-office was \$57,209; the expenditure, \$238,499; the cost of the mail service beyond the colony, \$42,085.

The total mineral output—chiefly copper ore—was \$939,322, against \$603,547 in the previous year.

The lumbering industry showed a value of \$199,101, compared with \$75,853 in 1899.

NEW HAMPSHIRE. (See under UNITED STATES.)

NEW JERSEY. (See under UNITED STATES.)

NEW MEXICO. (See under UNITED STATES.)

NEW YORK. (See under UNITED STATES.)

NEW YORK CITY. Government.—The city officers during the year were: Mayor, Robert A. Van Wyck; President of the Council, Randolph Guggenheimer; Borough Presidents—Manhattan, James J. Coogan; Brooklyn, Edward M. Grout; Bronx, Louis F. Haffen; Queens, Frederick Bowley; and Richmond, George Cromwell—all of whom are Tammany Democrats except Mr. Cromwell, who is a Republican, and took office on Jan. 1, 1898, except Mr. Coogan, who took office on Jan. 5, 1899. Also there are the following county officers: County Clerk, William Sohmer; Sheriff, William F. Grell; and Register, Isaac Fromme—all of whom are Tammany Democrats and took office on Jan. 1, 1898, except the Sheriff, who took office on Jan. 1, 1900.

Taxes and Assessments.—These are in charge of a department, of which Thomas L. Feitner is president. The other members are Edward C. Sheehy, Arthur C. Salmon, Thomas J. Patterson, and Ferdinand Levy (salaries, \$7,000 each). Office, 280 Broadway. They report the total valuation of real and personal property as assessed in 1901 to be \$3,787,970,873, as against \$3,654,108,798 for 1900, an increase of \$133,862,075. They were distributed as follow: Manhattan, \$2,713,468,664, as against \$2,653,364,287 in 1900, an increase of \$60,104,377; Bronx, \$155,996,910, as against \$146,508,490 in 1900, an increase of \$9,488,420; Brooklyn, \$748,203,743, as against \$695,321,340 in 1900, an increase of \$52,882,403; Queens, \$118,006,430, as against \$109,928,553 in 1900, an increase of \$8,077,877; Richmond, \$52,295,126, as against \$48,988,128 in 1900, an increase of \$3,306,998. The following are the assessments levied on large corporations: Consolidated Gas Company, \$18,903,378; Metropolitan Street Railway Company, \$17,577,975; Third Avenue Railroad Company, \$10,525,605; Edison Illuminating Company, \$6,202,250; New York Telephone Company, \$5,084,151; Brooklyn Union Gas Company, \$5,000,000; Second Avenue Railroad Company, \$4,053,480; Brooklyn City Railroad Company, \$3,000,000; Delaware and Hudson Canal Company, \$2,711,000; New York Mutual Gaslight Company, \$1,685,000; Commercial Cable Company, \$1,000,000; Tiffany Manufacturing Company, \$990,400; Long Island Railroad Company, \$500,000; and New Amsterdam Gas Company, \$100,000.

Public Improvements.—The Board of Public Improvements consists of the president of the board, Maurice F. Holahan (salary, \$8,000), and the Commissioners of Water-Supply, of Highways, of Street Cleaning, of Public Buildings, Lighting and Supplies, and Bridges, each of whom receives a salary of \$7,500. This board was legislated out of existence with the end of the year. In 1901 it inaugurated work on the largest plan of street openings and street extensions, in the district lying northerly of West 155th Street, and bounded by the Hudson river, Spuyten Duyvil creek, and the Harlem river, ever proposed at one time during any administration. The map of the entire region will be altered. It was proposed that 62 new streets or extensions of existing streets shall be laid out. It was also proposed to provide 5 new public parks and widen 3 important streets. It was estimated that the cost of all these improvements will amount to more

than \$20,000,000. The following are some of the other proposed improvements: New avenue, from extreme northerly point of Boulevard Lafayette by viaduct across Dyckman Street, along portions of Bolton Road, east of Episcopal House of Mercy, by bridge across Harlem River Ship Canal to intersection of Kappock Street and Spuyten Duyvil Parkway. New street west of Episcopal House of Mercy, connecting with Bolton Road. New bridge across Harlem River Ship Canal, from Fort George, at Sedgwick Avenue, between Burnside Avenue and East 177th Street, with approaches to Tenth Avenue, Fort George Avenue, Harlem River Speedway, and intersection of Dyckman Street, Eleventh Avenue, and Nagle Avenue. Plaza, 150 feet radius at intersection of West 181st Street and Broadway. Plaza, 150 feet radius at intersection of Dyckman Street, Broadway, Boulevard Lafayette, and Seaman Avenue. It is also proposed to establish a new park, bounded on the east by the present line of High Bridge Park, on the north by Dyckman Street, on the west by Eleventh Avenue, and on the south by the proposed West 192d Street. A new park is proposed with a 40-foot canal running through it, extending from the Harlem River Ship Canal to King's Bridge Avenue. There is also a new park to be laid out on Jumel Terrace, and a new Fort Charles Park, and also a westerly extension of Fort Washington Park from the present shore-line to the easterly line of new avenue along bulkhead lines.

Health.—The collection of vital statistics is under the care of a board, consisting of three commissioners, one of whom must have been for five years a practising physician, the health officer of the port, and the president of the Police Board. The officials for 1901 were: Michael C. Murphy, president (salary, \$7,500), until Feb. 21, 1901, when he was succeeded by John B. Sexton (salary, \$7,500), Dr. William T. Jenkins, Dr. John B. Cosby, Health-Officer Dr. Alvah H. Doty, and President Bernard J. York of the Police Board, until Feb. 21, 1901, when he was succeeded by Police-Commissioner Michael C. Murphy. The secretary of the board is Emmons Clark, and the office is on the corner of Sixth Avenue and 55th Street. The vital statistics were as follow: The number of deaths in 1901 was 70,717, against 70,872 in 1900. There were 24,269 deaths of children under five years, 15,475 under one year, 9,951 sixty-five years and over, 17,427 deaths in institutions, and 39,118 deaths in tenements. There were 80,735 births and 33,485 marriages reported. The number of deaths from pneumonia was 9,117, against 10,482 for 1900—more than from any other disease. There were 716 suicides, against 761 for 1900, and 111 homicides, against 140 for 1900. The death-rates for the 5 boroughs are as follow: Manhattan, 20.55; Bronx, 21.60; Brooklyn, 19.25; Queens, 17.20; and Richmond, 19.42. The rate for the 5 boroughs together is 20. The statistics give the estimated population of the city for 1900 as 3,444,675, and for 1901, 3,536,517.

Police.—This department at the beginning of the year was managed by a board of 4 commissioners, appointed by the Mayor for a term of six years, who were as follow: Bernard J. York, president; John B. Sexton, Jacob Hess, and Henry E. Abell, with William S. Devery as chief of police. The inaction of this board and the persistent disregard of criticism continued until (according to Lewis F. Nixon) "under the rule of Chief Devery the condition of affairs in the Police Department became the worst in the history of the city of New York. The police officials

protected lawbreakers and gave their support to many forms of crime." Accordingly a bill was introduced into the Legislature, abolishing the bipartisan board of four police commissioners and the office of chief of police, and substituting for them a single commissioner, which was signed by the Governor on Feb. 22. The Mayor immediately appointed Michael C. Murphy to be commissioner of police, and Commissioner Murphy at once appointed Chief Devery to be first deputy police commissioner, after which, on March 4, Bernard J. York was appointed second deputy. The committee of five appointed by the Tammany Hall Executive Committee to examine into vice on the East Side continued their work until Feb. 25, when they reported to the Executive Committee and asked to be discharged. The report, which was not published, gave, according to an account by Chairman Nixon, a list of 340 gambling places that were open, and of which more than 270 had been closed and the gamblers driven from the city. It also announced that all disorderly places near public schools and churches had been closed, and measures taken to prevent their being reopened. The charge against Capt. John D. Herlihy, of the Twelfth Precinct, which grew out of a letter sent to Mayor Van Wyck by Bishop Potter, was formally presented before the Police Board, and after examination by the commissioners he was exonerated, the decision being that the charge had not been proved. A most important revelation concerning the corruptness of the Police Department was a report published in August by the Society for the Prevention of Crime, in which it was shown that the police officials protected gambling and other vices, receiving payment for such protection. It was found that methods were in existence by means of which pool-rooms and other gambling establishments could be notified of an intended raid within five minutes after a police captain had received information of a proposed descent on the place in question. These methods were tested under the direction of the counsel of the Society for the Prevention of Crime, and were found to work in every instance. This led to a complaint, lodged with the District Attorney, charging Chief Devery with neglect of duty, but up to the close of the year that office had not succeeded in bringing the matter before the courts. Similar charges were submitted by the Merchants' Association to the police commissioner, and also to the Mayor, but without results. Charges were brought against Wardman Bissert for receiving bribes from houses of prostitution, and he was convicted through the efforts of the District Attorney's office and sentenced to five years' imprisonment. Capt. Thomas J. Diamond, who was the immediate superior of Bissert, was subsequently tried for neglect of duty and convicted, in consequence of which he was, on Dec. 11, discharged from the force. Wardman Glenon, of the Tenderloin district, who was regarded as the right-hand man of Devery in collecting bribes, was tried and found guilty on Dec. 21.

Fire.—This department is managed by a single commissioner. The incumbent during the year was John J. Scannell. The chief of the department was Edward F. Croker. The headquarters are at 157 East 67th Street. For the boroughs of Brooklyn and Queens there is a deputy commissioner. During 1901 the fire-fighting force in the boroughs of Manhattan, the Bronx, Brooklyn, and Queens consisted of 2,586 officers and men, apportioned among 137 engine companies, 44 hook-and-ladder companies, 5 fire-boats, and 5 water-towers. A volunteer force, consisting of

2,000 men in the borough of Queens and about an equal number in the borough of Richmond, increased the total force to 6,000 men. During the year there were 8,427 fires. In the borough of Combustibles there was collected in all the boroughs for licenses, permits, and penalties, \$87,195 during the year. In the bureau of the fire-marshal 49 arrests in connection with suspicious fires, resulted in 3 convictions with several cases still pending. On June 28, Commissioner John J. Scannell, and William L. Mark, a manufacturer's agent, were indicted by the grand jury as a result of the ten days' investigation into the manner of purchasing supplies by the Fire Department.

Education.—The board having control of this subject consists of 20 commissioners, who are appointed by the Mayor and receive no salary. The president of the board was Miles M. O'Brien. The borough superintendent is John Jasper, and the headquarters are at the corner of Park Avenue and 59th Street. The report of the borough superintendent, made on Oct. 2, showed that the attendance of pupils on June 28 was 223,858; attendance of pupils on Sept. 27, 246,980; average attendance for three weeks ending Sept. 27, 239,226; number of classes on Sept. 27—whole day 5,473, part time 374; register of pupils at close of school on Sept. 27, 265,947; number of regular teachers, including principals, present on Sept. 27, 5,951; number of children on waiting list at close of school on Sept. 27, 3,720; number of children in part-time classes on Sept. 27, 19,309; number of vacant sittings at close of school on Sept. 27, 23,044. The increase in school attendance that usually occurs at the beginning of the autumn was in part provided for by a new school, No. 171, between Fifth and Madison Avenues, reaching from 103d to 104th Streets, and in school No. 44, on the southeast corner of Hubert and Collier Streets. Also the following new schools were to be finished by contract on the following dates: School No. 133, corner Fox and 167th Streets, Sept. 14; school No. 173, on 163d Street, between Grant and Morris Avenues, Sept. 15; school No. 61, on the corner of 169th Street and Third Avenue, Oct. 1. It was announced that an experimental school will be built on Lawrence Street, near the junction of 128th Street and Amsterdam Avenue, under the auspices of the Teachers' College, with a fund of \$100,000, presented to that institution by a resident of New York city.

Carnegie Libraries.—On March 12, Andrew Carnegie, after conference with Dr. John S. Billings, Director of the New York Public Library, arrived at the conclusion that branch libraries, to reach the masses of the people, were desirable, and in consequence determined to provide for 65 branches, the average cost to be \$80,000, which he offered to present. "If New York will furnish sites for these branches for the special benefit of the masses of the people, as it has done for the central library, and also agree in satisfactory form to provide for their maintenance as built, I should esteem it a rare privilege to be permitted to furnish the money as needed for the buildings, say \$5,200,000." This information was promptly conveyed to Mayor Van Wyck in a letter by the secretary of the Board of Trustees of the New York Public Library. An act providing for the acceptance by the city of New York of this gift from Mr. Carnegie was introduced in the State Legislature on March 25, and was subsequently passed and signed by the Governor. At a meeting of the Board of Estimate, on July 17, Mr. Carnegie's gift was formally accepted. The agreement, after showing the offer

of Mr. Carnegie to provide the funds necessary for the building and equipment of 65 branch libraries of the New York Public Library, recites that the city must provide ground on which the buildings are to be erected. The enabling act of the Legislature by which the city of New York was authorized to accept Mr. Carnegie's offer is printed in the contract in full. The agreement says that the existing free public libraries are not to be incorporated in this arrangement. The contract then says that the city shall proceed to acquire by gift, condemnation, or purchase such sites as may be necessary, not to exceed 42 in Manhattan, Bronx, and Richmond. The city is authorized, by the unanimous vote of the Board of Estimate and the Sinking-Fund Commission, to use any real estate now owned by the city and not used for other purposes for a library site under the contract. In October the secretary of the New York Public Library said that a site on East 79th Street, near Second Avenue, had been secured and approved by the Board of Estimate. Other sites were under consideration, and the services of a board of architects had been secured to supervise the designing and construction of the different branches. Subsequent to the gift by Mr. Carnegie a number of sites were offered for the library by generous-minded citizens.

Underground Rapid Transit.—Work on the subway for the new underground rapid-transit railroad, which was begun in September, 1900, progressed during the year with astonishing rapidity. The first annual report of the Rapid-Transit Commission showed that more than 200 blocks had been opened in various sections of the city, reaching from City Hall to the Bronx. They had expended then \$8,500,000, and one-fourth of the tunneling work had been done. The average monthly expenditure had been more than \$750,000, and the average number of men engaged in the work was 7,500. Twenty-five blocks were practically completed, according to the report, and 17 blocks of rock tunnel were finished, while 1,000,000 cart-loads of earth and rock had been removed and 2,000,000 days' work done. Since the annual report was issued the work has progressed with still greater rapidity. Extra steam and electric machinery necessary to supply power was secured, so that when 1902 came in the preliminary work had all been done. At that time 35 per cent. of the entire work was completed—58 per cent. of the excavation and 36 per cent. of the rock removed, at a total cost of \$12,500,000. Work was then proceeding at a cost of \$1,000,000 a month.

Deputy Chief-Engineer George S. Rice then calculated that trains would be running over the underground route by the latter part of August or the early part of September, 1903, while Contractor John B. McDonald's agreement does not call for its completion before August, 1904. By far the greatest part of the work has been done on the 5 most difficult sections—the down-town loop or terminus, in City Hall Park, the 59th Street section, three of the tunneling sections, and that at the circle at Eighth Avenue, at the west-side entrance to Central Park. At this last point the work was completed, and beyond doubt it was the most difficult of all. Here the tunnel passes under three lines of surface-car tracks, and thence northward along the new Broadway under double sets of electric-car tracks. At this point the first completed rapid-transit station, with every modern improvement, has been roofed over, ready for use. It is glazed with white, and has the appearance of a well-finished building rather than that of a railway tunnel.

The work between City Hall and Great Jones Street, now practically completed, gave much trouble to the laborers, owing to the fact that the old canal from which Canal Street got its name still rises and falls, at the depth to which they had to go, with low and high tide on the river fronts; and the shifting of the sands caused by this disturbance required extra precautions in shoring up many buildings between City Hall and Canal Street. At City Hall, the main road's terminal loop, the extensive vehicular traffic, in conjunction with the numerous surface railway-lines along Park Row, made the work particularly heavy and tedious; but these obstacles have been overcome, and the work has been roofed over.

Under the old Park Avenue tunnel, on Fourth Avenue, almost solid rock was encountered from 32d Street to the Grand Central station at 42d Street; but the excavation of the rock in Murray Hill and under the Park Avenue tunnel was accomplished, and a half mile of the tunnel was practically completed there.

Four blocks of tunnel were carved out of the foot-hills at Washington Heights, where two stations will be more than 100 feet below the surface of Eleventh Avenue. All the rock taken out here from this great depth was removed by hoisting through shafts. Near the north end of Central Park, where the road will branch off to carry East Side passengers under Central Park to the borough of the Bronx, a good deal of work was done in blasting and tunneling the rocky cliffs.

Along the east side of Union Square and northward in Fourth Avenue, all the deep rock was removed, and the work was well advanced. Considerable progress has been made on the Bronx branch, and the construction of two iron tubular tunnels under Harlem river, which will connect it with the Manhattan section, was also going on well. Running north from Melrose Avenue, in the Bronx, where the underground tracks will emerge from the tunnel and connect with the elevated road, which will continue to the northern terminus, work was fairly well advanced. There was considerable tunneling around the point where the tracks will emerge. In Lenox Avenue, between Central Park and Harlem, a great section of the tunnel was roofed and ready for the laying of the track.

A block of ground extending from 58th to 59th Street, along the North river, was acquired, to be used for the erection of the main power-house for the road. In December the Rapid-Transit Subway Construction Company purchased a plot of ground, consisting of about 150 city lots, on either side of Harlem river. This will be used for various stations on the Lenox Avenue branch of the road, leading from the main line to the borough of the Bronx, and for the erection of an additional power-house.

This year considerable changes were made in the proposed route for the road. That finally decided upon shows that, starting from the City Hall, there will be 4 tracks running north on Elm Street and Fourth Avenue to the Grand Central station on 42d Street, thence westerly to Broadway, then northerly to 104th Street; then 3 tracks continue up Broadway to 169th Street, thence up Eleventh Avenue to Fort George, where they will connect with an elevated road extending as far north as Bailey Avenue. At 104th Street and Broadway a two-track road will branch off easterly under Central Park, and at 110th Street will turn up Lenox Avenue, passing under Harlem river and running northward on the Southern Boulevard and Boston Road to Bronx Park.

EXCAVATION UNDER THE ELEVATED RAILWAY, BROADWAY AND SIXTY-FIFTH STREET.

ROCK EXCAVATION IN FOURTH AVENUE, LOOKING NORTH FROM FIFTEENTH STREET.

In September it was finally determined to build an additional underground road from the terminus of the rapid-transit road at City Hall, under Broadway to the Battery, thence under the East river to the foot of Joralemon Street, Brooklyn. It will run to the intersection of Fulton Street and Flatbush Avenue, and will connect with the Long Island Railroad. The length of this road will be 4 miles, and the cost about \$10,000,000, against the 21 miles of tunnel road in Manhattan and the Bronx, the contract price of which is \$35,000,000. As the legal proceedings necessary for the building of this road were only completed in December, 1901, the contract for its construction had not been let when this volume went to press.

In October, August Belmont, John B. McDonald, contractor, E. P. Bryan, his general manager, and Chief-Engineer William Barclay Parsons, of the Rapid-Transit Commission, visited Europe and inspected the single underground road in Paris, the two roads in Glasgow, Scotland, and the five in London, with a view to obtain the latest improvements in motive power, heating and lighting, and construction of stations. Chief-Engineer Parsons is authority for the statement that while they had secured much valuable information, they had not come to any definite determination as to these matters, as they hoped that American ingenuity could improve upon the best methods employed across the water. The roads mentioned are the only underground railroads in the world with the exception of the one in Boston and one in Budapest, the construction of which was begun last year.

Street-Railways.—At the annual meeting of the Metropolitan Railway Company, the report for the year ending Sept. 30 was submitted, which showed that the gross earnings were \$10,455,872.30, and the operating expenses were \$5,328,649.04, resulting in net earnings of \$5,127,223.26, against which are charged interest on bonds of \$1,809,680.92, and on taxes of \$873,451.23, leaving a net income of \$2,444,091.11, from which dividends of 4 per cent. on \$48,000,000 were paid, amounting to \$1,920,000, leaving a surplus for the year of \$524,091.11. The total number of passengers carried were 194,152,316, as against 183,788,851 for the previous year. The operating percentage was 50.97 per cent., as against 52.21 per cent. for the previous year, taxes excluded. With the taxes this percentage is increased to 59.32 for last year and 60.98 for the previous year, and 65.60 for 1899. The line from Tremont to Fordham was completed and put in operation on July 1; also during the year the change to electrical equipment has been in active progress. Buildings for a central power station at East 74th Street, and substations at Allen Street, 34th Street, and 99th Street were completed, in which the machinery was installed. Motor equipments were procured, and 300 new cars were received during the year.

Bridges.—Early in the year announcement was made that the first strand of wire to be strung across East river on the new bridge from anchorage to anchorage was ready, and at the close of the year announcement was made that the first of the 37 strands for the first of the big cables was completed on Dec. 14, and work on the second strand and on the first strand of the second cable was to begin on Dec. 16. There will be 4 cables in all, each strand contains 208 wires, and the strands are built up in place on the bridge.

The plan for the construction of the Blackwells Island bridge from 60th Street, Manhattan, to Ravenswood, was approved by Secretary Root

on Feb. 23. This bridge will be 170 feet wide, and will be constructed on the same principle. From the East river shore a trestle will be constructed to the opposite shore of Long Island City, which will be 2,710 feet, and its middle pier will be on Blackwells Island. It will accommodate 4 elevated railroads, 2 double roads for trolley cars, paths for bicycle riders, footpaths, 2 roadways for heavy teams, and also roadways for lighter vehicles. The estimated cost of the structure is \$5,740,000.

On July 24 it was discovered that 7 of the suspension rods and 2 of the cable bands on the bridge between Brooklyn and New York were broken, in consequence of which traffic on the roadways was suspended for several days. The bridge was promptly examined by experts, and while the belief was expressed that subsequent to the repair of the bridge it was stronger than ever, still a limit had been reached for possible traffic. The fractures were found to be due to dead weight and vibration instead of heat, as originally supposed, and it was found during repairs that a sag or drop of some six inches had occurred on the north roadway in consequence of the accident. While it was not originally intended for street-cars, they had been permitted to cross the structure under regulations to keep 102 feet apart, but at rush times the cars were frequently within 50 feet of each other. Regulations were introduced compelling them to remain 200 feet apart between the New York and Brooklyn towers, and 102 feet apart on the spans extending from the approaches to the towers.

The American Scenic and Historic Preservation Society arranged for a competition for the naming of the four East river bridges that are now built or in process of construction, and a prize, consisting of a silver copy of the medal commemorating the consolidation of Greater New York, was awarded for the following names: Brooklyn, for the existing bridge, variously known as the Brooklyn Bridge, New York and Brooklyn Bridge, Suspension Bridge, etc.; Manhattan for the Delancey Street bridge, which is now almost completed; York for the bridge at the foot of Pike Street; and Queens for the bridge across Blackwells Island.

A bill permitting the erection of a bridge over the Hudson river by the New York and New Jersey Bridge Company, the franchise for an elevated passenger and freight belt line over the dock property, was passed by the Legislature, but, largely owing to the severity of the criticism that it met with on the giving away of valuable franchises, the bill was vetoed by the Governor on May 11.

Tunnels.—In connection with the development of the rapid transit, the building of tunnels under the rivers bounding New York was discussed during the year. A proposition to construct a tunnel to South Brooklyn and under the Narrows and Staten Island to the New Jersey shore, was presented by Albert L. Johnson before the Rapid Transit Commissioners, and was rejected by them on March 29.

The plans of the Long Island extension railroad for the tunnel that it proposes to build from Long Island City to Manhattan island were filed in the offices of the county clerks for New York and Queens Counties on June 21. The tunnel will begin in Long Island City at the right of way of the Long Island Railroad at Thompson Avenue, and will descend on a grade of 1.25 per cent. to a point just beyond Vernon Avenue. Between Van Alst Street and Vernon Avenue it will make a curve to the southwest, and thence will con-

time on a level grade as far as Front Street. When it reaches Vernon Avenue the tunnel will be about 40 feet below the surface of the ground. Running between Borden and Flushing Avenues, the tunnel will still farther descend on a grade of 1.5 per cent. to the pier-head line. From here the grade will be 0.47 per cent., and the line of the tunnel will go as straight as an arrow to the ferry-house at 34th Street, under which the tunnel will make a curve westward. From here on the tunnel will rise gradually, the grade to Lexington Avenue being 2.5 per cent., the steepest of the entire line. Crossing underneath the rapid-transit tunnel, the rise will continue on a grade of 1.5 per cent. to Sixth Avenue, and from there on it will continue almost on a level to the terminal at 45th Street and Broadway, which is reached through Seventh Avenue. The curve at Seventh Avenue and 33d Street will be the sharpest of the whole line. The greatest depth to which the tunnel will descend will be underneath the East river, where the roof will be about 80 feet beneath high-water mark. The water at this point ranges in depth from 57 feet near the center to a few feet near the shore-line, so that the roof of the tunnel will be 20 to 75 feet beneath the bottom of the river.

The announcement was made on June 3 that the engineers of the Rapid Transit Commission would begin at once a series of borings in the bed of East river, to inaugurate the beginning of work on the tunnel to Brooklyn. It was said that several months would be spent in surveys and the preparation of working plans before the contracts could be let.

The old North river tunnel, on which work was begun many years ago, has been announced for completion within a year, and negotiations are said to have been arranged with street-railway companies by means of which trolley-cars will be run through the tunnel to New York.

New Armories.—On Sept. 21 the corner-stone of a new armory for the First Battery of the National Guard was laid in 66th Street, near Columbus Avenue. The plans of the new building called for a three-story building, of pressed brick above granite, at a cost of \$157,000. A riding-ring and stabling for 76 horses will be features of the building. It is to be completed by June of 1902. On Oct. 2, plans were filed for a new armory for the Sixty-ninth Regiment, to occupy the entire block front on the west side of Lexington Avenue, between 25th and 26th Streets. The drill hall will be 262 feet long by 189 feet wide. On the first floor there will be a library and meeting room, as well as accommodations for the quartermaster, commissary, and armorer. The second floor will be devoted to company rooms and staff-officers' rooms. Besides a gymnasium, 35 by 70 feet in size, the third floor will have a kitchen, storerooms, and quartermaster's issuing room. On the 25th Street corner a tower will rise to the height of 7 stories. The basement will contain the rifle-range, 228 feet long, with 12 targets, and a plunge-bath, 25 feet wide and 70 feet long. The estimated cost is \$450,000.

Monuments.—The two bronze figures representing Painting and Sculpture and Architecture, each 6 feet 3 inches in height, were placed at each end of the white marble monument of Richard M. Hunt, against the pilasters. The figure Painting and Sculpture holds in her hand the Theseus from the pediment of the Parthenon, and Architecture holds a model of the Administration Building of the World's Columbian Exposition, one of Mr. Hunt's masterpieces.

On April 15, a bronze bust of Charles Broad-

way Rouss, by Pompeo Coppini, was presented to the city by women of the South. As the Park Department can not receive the statue of a living person, the exercises were held in the Arsenal in Central Park.

On April 15, the Mary Washington Colonial Chapter of the Daughters of the American Revolution unveiled a bronze memorial tablet on the old prison, now the Register's office, in City Hall Park. The inscription reads: "This tablet marks the site of the Provost Prison, where patriots died for the cause of freedom about A. D. 1776. Erected by the Mary Washington Colonial Chapter, Daughters of the American Revolution, April 15, A. D. 1901."

A bronze statue of Henry B. Hyde, founder of the Equitable Life Insurance Company, by J. Q. A. Ward, was unveiled in the arcade of the Equitable Building on May 2. The exercises were informal, but addresses by James W. Alexander and Chauncey M. Depew were made at a luncheon that preceded the uncovering of the statue.

A tablet commemorative of the hundredth anniversary of the birth of Peter Cooper was unveiled in the southern end of the main entrance of Cooper Union on May 11. The tablet represents the combined work of the sculptor Augustus St. Gaudens and the architect William C. Haskell. It is of Siena marble, the entablature being supported on carved consoles. The panel, measuring 2½ by 4 feet, is of green serpentine marble, and in this is embedded a tablet 22 inches in diameter, a plaque intaglio of Peter Cooper done in bronze and surrounded by a laurel wreath. Bernard M. Wagner, President of the Alumni Association, presented the tablet to the trustees, and John E. Parsons accepted it on behalf of that body.

On Nov. 16, the one hundred and twenty-fifth anniversary of the battle of Fort Washington, the Empire State Society of the Sons of the American Revolution, with the cooperation of the American Scenic and Historic Preservation Society, dedicated a memorial marking the site of the Revolutionary fort. It is on the northeast bastion of the fort, on Fort Washington Avenue, in the line of 183d Street protracted. At that point the western sidewalk of the avenue cuts through the native rock, leaving a vertical face about 10 feet high. Against this is the memorial, consisting of a wayside seat and step, about 8 feet wide, flanked by two pilasters rising to the top of the rock, supporting an entablature and embracing a tablet inscribed as follows: "This memorial marks the site of Fort Washington, constructed by the Continental troops in the summer of 1776. Taken by the British after a heroic defense, Nov. 16, 1776. Repossessed by the Americans upon their triumphal entry into the city of New York, Nov. 25, 1783. Erected, through the generosity of James Gordon Bennett, by the Empire State Society of the Sons of the American Revolution, Nov. 16, 1901. Site registered by the American Scenic and Historic Preservation Society." Extending back on the ground level with the top of the structure is a concrete platform for a cannon and pile of cannon-balls. The design is by Charles R. Lamb. The tablet was unveiled simultaneously with the hoisting of the United States flag in the fort by Christopher R. Forbes, whose ancestor, John Van Arsdale, raised the flag on Evacuation Day, 1783, at the Battery.

A monument to Robert Fulton, inventor of the steamboat, was unveiled on Dec. 5, in Trinity Churchyard. The exercises, which were under the auspices of the American Society of Mechanical Engineers, began with orations by Rear-Admiral George W. Melville, U. S. N., and Dr. Robert H.

From photographs by Pierre P. Pullis.

Thurston, of Cornell University. The site is next to that of Alexander Hamilton's memorial, on the Rector Street side of the yard. The monument stands 12 feet high and is of plain granite, bearing a bronze relief of the features and bust of Fulton. On the foot of the granite block is the inscription: "To the memory of Robert Fulton. Born, 1765. Died, 1815. Erected by the American Society of Mechanical Engineers, 1901."

Excise.—The operation of the State liquor-tax law in New York city during the excise year ending April 30, 1901, was as follows: Net amounts received from the issue of certificates, transfers, and fines, \$7,962,555.25; State's one-third share, \$2,654,185.09; New York city's two-thirds' share, \$5,308,370.16; total, \$7,962,555.25. On the basis of the equalization table of 1900, prepared by the State Board of Assessors, the city has benefited by reduction in State taxes due to the State excise revenue of \$2,594,788.10, making a total benefit to New York city's revenue of \$7,903,158.26. The total number of certificates in force in New York city April 30, 1901, was 12,571. New York paid for excise taxes for the year expiring April 30, 1901, \$7,962,555.25, and there is paid back to it or credited to its account by the special deputy commissioners for the various boroughs and by the State of New York the sum of \$7,903,158.26. The boroughs of Manhattan and the Bronx paid for excise taxes for the year expiring April 30, 1901, \$5,293,750.97, and there is paid back to them and credited to their account by the special deputy commissioner for the boroughs of Manhattan and the Bronx and by the State of New York the sum of \$5,521,192.26.

Fortifications.—In the annual report of the chief of engineers concerning the defenses of New York, the following statements appear: Eastern entrance—electric-lighting plants have been built for all the batteries, range-finder stations have been built, and an electric tide indicator has been installed. Under recent allotment work has been started upon two emplacements for 6-inch rapid-fire guns. Thirteen hundred and forty-three linear feet of sea-wall have been built, and further construction is in progress. All materials needed for the torpedo defense of the eastern entrance are on hand and in good condition. Southern entrance—2 12-inch gun emplacements begun and about half completed; 2 6-inch emplacements nearly completed; 6 emplacements for 6-inch rapid-fire guns on pedestal mounts just begun. One range-finder tower has been built and a second nearly completed. Permanent magazines and parapet have been built for the pneumatic dynamite-gun battery. Two central electric-power stations have been begun. Under recent allotments extensions of 2 sea-walls have been begun. A project for enlargement of Governors Island, New York, has been adopted and work is about to begin. The report further shows that the expenditure during the fiscal year was for removal of rocks and boulders from the channel between Blackwells Island and the Battery. At Man-o'-War Rock 8,481 cubic yards of rock were removed, or about three-sevenths of the amount required to afford a depth of 26 feet. Little progress was made on the reef off 26th Street, less than one-tenth of the proposed rock having been taken out to give a depth of 26 feet. From Battery and Shell reefs 19,743 tons of material were removed, thereby widening the channel off the Battery and South Ferry slip. The water front between East 7th and East 18th Streets was deepened several feet in order to facilitate the dockage of vessels. Shoals on either side of the main ship channel have been removed, widening the channel

out to nearly its full width of 1,000 feet, and a large shoal on the north side of Battery Point, just beyond the Swash channel. The result has been to restore the passage of ships at these points, which is necessary for them to meet and pass. Dredging was also done in the Island channel, and to deepen the approach to the Government piers at Fort Hamilton and Fort Hancock, New York harbor. Up to the close of the fiscal year 423,209 cubic yards of sand had been removed from the outer side of the bar at the entrance to Ambrose channel.

Historical.—The plan to purchase the property known as the Jumel Mansion and grounds was favorably considered by the Board of Public Improvements on March 6. The grounds occupy a space of 67,391 square feet, bounded by 160th and 162d Streets, Edgewcombe Road, and Jumel Terrace, the property being on a bluff 100 feet above the Harlem river. The mansion, which is in the colonial style of architecture, was built in the year 1750 by Roger Morris, a colonel in the British army, who married Mary Phillipse, whom Washington wooed and lost. Gen. Washington used the mansion as a headquarters from June to the middle of October, 1776. Stephen Jumel bought the property in 1800, and his widow, Mme. Jumel, occupied the property at the time of her death, in 1865, and it was here that she married Aaron Burr. The house is in a fair state of preservation, and the grounds include about 27 city lots. The cost of the property to the city will be about \$200,000. The Society for the Preservation of Scenic and Historic Places of Interest also presented a petition before the Board of Public Improvements, asking that the city acquire half the block bounded by Coenties Slip, Broad, Water, and Pearl Streets, this plot to be used as a public park. The first two stories of the old building long known as Fraunce's Tavern still remain, and the society proposes to tear down the two stories built on top of these and to restore the ancient Dutch roof, the lattices over the windows, and other features of the historic place as it was a hundred years ago. The society also proposes to take charge of and maintain the park and tavern, as has been done in the case of Stony Point. In what is known as the "Long Room" of this old tavern George Washington delivered his farewell address to his generals.

Immigration.—The reception of immigrants in New York is under national supervision. The commissioner, who is appointed by the President, is Thomas Fitchie. Ellis Island, in New York Bay, is the landing-place for the immigrant. According to the report for the year ending June 30, 1901, the number of cabin and steerage passengers who arrived in the years 1899-1900 and 1900-1901 was 586,552, of whom 453,496 came in the steerage. The number of immigrants from almost every foreign country showed increases in 1900-1901. The total increase was 47,219. Irish and Bohemians have brought over the greatest number of women, with the Hebrews, Germans, and Scandinavians next. There has been an increase in the immigration from southern Italy, and a still greater increase in the number of Ruthenians, Armenians, Syrians, Greeks, Croats, and Dalmatians. During 1899-1900 the number of male immigrants was 228,414, and females 113,298, while last year the respective figures were 265,818 and 123,113. In 1900-1901 the total amount of money brought over by immigrants was \$5,490,080, or \$14.12 a head, as against \$4,610,649 in the preceding year, or \$13.49 a head. Last year those classed as illiterate of fourteen

years of age and over numbered 107,323, or 27.60 per cent. In 1899-1900 the proportion was 23.41 per cent. and the number 79,988. Out of the total immigration the percentage of deportations was 1.04 in 1899-1900 and 0.80 in last year.

Real Estate.—The year 1901 was the most remarkable year that New York city has ever had in the volume of business transacted in the real-estate market and in the building industry. It was marked by the incorporation, followed almost immediately by active operations, of syndicates with enormous capital for dealing in real estate, and likewise by the incorporation of building, loan, and trust companies for the erection of gigantic structures such as had never before been contemplated.

The recorded transactions at the Register's office numbered 15,919 transfers of realty, against 14,587 in 1900, and the consideration involved in these transfers was increased from \$114,243,112 in 1900 to \$156,413,052. There was a marked advance in the price of real estate, as the average price per parcel in 1900 was only \$17,800, and in the last year it was \$21,900. The expressed consideration has heretofore, in one or two years, exceeded the figures of last year, but owing to the fact of the formation of the syndicates—many of which were for speculative purposes—the deeds to the largest transactions were recorded at what, on the real-estate market, is known as a nominal consideration, consequently no figures could be obtained. The transactions of this character in 1900 were only 25 per cent. of the total, while last year they were 60 per cent.

South of City Hall, the sale of old buildings, which were torn down and upon which the latest improved office buildings were or are being built, was most remarkable. This was due to the demands of extensive business corporations from all parts of the country, which were establishing headquarters in New York. Perhaps the most remarkable movement, however, has been that on Fifth Avenue. In 1900 but 81 conveyances were recorded south of the northerly limit of Central Park, while in 1901 164 parcels of realty were transferred in that district. Between 23d and 50th Streets the avenue became more and more valuable as a site for fashionable shops. Property here that could have been bought a few years ago for \$20 a square foot, sold last year as high as \$72 a square foot.

Farther up the avenue, opposite Central Park, the character of this thoroughfare was determined definitely by the erection of the fine mansion of Andrew Carnegie and the purchase of mansions or ground for the erection of palatial residences by the magnates of the Steel Trust and other millionaires.

Another center of great activity was around Greeley Square, at the junction of Broadway, Sixth Avenue, and 34th Street, where two of the largest retail dry-goods companies began operations for the erection of mammoth establishments. They paid the highest price ever known in this locality for the large properties they purchased. Then, too, the Pennsylvania Railroad Company purchased the two blocks of ground between 32d and 33d Streets, between Seventh and Ninth Avenues, at various prices. One house in 32d Street, between Seventh and Eighth Avenues, they acquired for \$16,500, while for a precisely similar house adjoining they paid \$26,000. On these two blocks, the company announced in December that they proposed to erect a great central station, to be connected with their main line by a tunnel under the North river and by another tunnel to

the East Side and under the East river to connect with the Long Island Railroad.

Immediately after the advent of 1900 real-estate speculators appreciated the fact that the new rapid-transit railroad—which will run through 42d Street and thence up Broadway—would, upon its completion, very greatly enhance the value of property around Longacre Square, as one of its most important stations in the center of the city will be there, and their purchases caused an advance of 30 to 35 per cent. in realty around it. Plans were filed for three hotels and a theater and 14 apartment-houses thereabouts. One of the hotels is to be erected on the southeast corner of 42d Street and Broadway—the site of the old St. Cloud Hotel—by William Waldorf Astor, and the preparatory work was begun. This hotel is to rival all others in New York.

There were extensive purchases of land in large parcels, many of them belonging to old estates, on Washington Heights and in the borough of the Bronx, at constantly advancing prices, by speculative syndicates and extensive operators, who in many cases resold to builders, loaning them money for the erection of buildings.

In the building trade, many new and interesting features were developed. The plans filed in the Department of Buildings in Manhattan and the Bronx called for the erection of 2,512 buildings, at a cost of \$118,897,820. The figures show a large increase over those of the years previous, in which the number of buildings planned was 1,969, and their estimated cost \$57,233,355. Five years ago the average cost of new buildings constructed on the island of Manhattan was but little over \$20,000. In 1899 it had increased to a little more than \$25,000, while last year it rose to \$48,000. The distinctive feature has been the erection of apartment hotels, and these have sprung up like mushrooms in the residential quarter of the city. The largest of these was erected on the southeast corner of 63d Street and Madison Avenue, and is 100 feet square and 13 stories high.

Every person who has visited New York will remember the triangle known as "the Flat-iron," bounded by Fifth Avenue and Broadway and 22d and 23d Streets, which comes to a point in front of the Fifth Avenue Hotel and Madison Square. This was sold to a syndicate, the old buildings occupying the site were torn down, and work was begun on a 20-story office-building.

In the borough of Brooklyn, the total number of conveyances of realty in 1901 was 16,231, against 15,814 in 1900, while the monetary consideration in the latter year was \$25,101,230 and in 1901 it was \$24,127,386, showing a decrease on an increased number of transactions. The total number of mortgages recorded was 12,343, against 12,534 in 1900. The total amount last year was \$67,889,940, against \$53,050,825. Plans were filed for 3,272 new buildings, at an estimated cost of \$17,992,075, against 2,982, at a cost of \$16,274,189 in 1900.

Political.—The regular election was held on Nov. 5, and unusual interest was manifested, owing to the fact that a determined effort was made to defeat the Democratic ticket, which bore the names of the Tammany candidates. There were 7 tickets in the field, as follow: Republican, Democratic, Prohibition, Socialist-Labor, Social-Democrat, Citizens' Union, and Greater New York Democracy, the last two of which nominated the same candidates as were on the Republican ticket, which in consequence became known as the Fusion ticket. The candidates were as follow: Republican—Mayor, Seth Low; Comptroller, Edward M. Grout; President of the Board of Alder-

men, Charles V. Fornes; Justices of the Supreme Court for the First Judicial District, Morgan J. O'Brien, James A. Blanchard, John Proctor Clarke, and Samuel Greenbaum; Judge of the City Court, Samuel Seabury; Sheriff, William J. O'Brien; County Clerk, Thomas L. Hamilton; District-Attorney, William Travers Jerome; Register, John H. J. Ronner; President of the Borough of Manhattan, Jacob A. Cantor; Coroners of the Borough of Manhattan, Gustav Scholer, Solomon Goldenkranz, Moses J. Jackson, and Nicholas T. Brown; also 73 aldermen and 60 members of the Assembly. Democratic—Mayor, Edward M. Shepard; Comptroller, William W. Ladd, Jr.; President of the Board of Aldermen, George M. Van Hoesen; Justices of the Supreme Court for the First Judicial District, Robert A. Van Wyck, Morgan J. O'Brien, Charles H. Knox, and Charles W. Dayton; Judge of the City Court, John P. Schuchman; Sheriff, John T. Oakley; County Clerk, George H. Fahrbach; District Attorney, Henry W. Unger; Register, Frank J. Goodwin; President of the Borough of Manhattan, Isaac Fromme; Coroners of the Borough of Manhattan, Edward T. Fitzpatrick, Edward W. Hart, Jacob E. Bausch, and Antonio Zucca; also 73 aldermen and 60 members of the Assembly. A canvass of remarkable interest followed, in which the dishonest rule of Tammany, as shown in the corrupt practises of the Police Department and the apathy in the office of the District Attorney, was thoroughly exposed, and the high standing of the fusion candidates established. A particularly interesting feature of the canvass was the candidacy of William T. Jerome, whose efforts as judge of a criminal court to secure the conviction of political criminals had been so persistently opposed by the higher Tammany officials. The entire fusion ticket was elected in the boroughs of Manhattan, Brooklyn, and Richmond, while in Queens and the Bronx the Democratic candidates for borough presidents were successful, and for the Board of Aldermen there were elected 26 Democrats from the boroughs of Manhattan and the Bronx, 5 from Brooklyn, 2 from Queens, and 1 from Richmond, and 18 fusionists from the boroughs of Manhattan and the Bronx, 17 from Brooklyn, 2 from Queens, and 2 from Richmond. Also the following Assemblymen: Democrats—from Manhattan and the Bronx, 24; from Brooklyn, 7; and from Queens, 2. Fusionists—from Manhattan and the Bronx, 11; from Brooklyn, 14; from Queens, 1; and from Richmond, 1. The total vote cast for Mayor was 560,120, out of which Mr. Low received 294,992, or a plurality of 29,864 over his nearest opponent. Subsequent to the election Nicholas Muller, Representative from the Seventh Congressional District, tendered his resignation, and Montague Lessler (Republican) and Perry Belmont (Democrat) were nominated to fill the vacancy.

Events.—On April 14, the corner-stone of a new Hall of Records was laid at the corner of Center and Chambers Streets. On May 30, the Hall of Fame of the New York University was inaugurated. On June 5, representatives of the New York Chamber of Commerce were entertained in London. On Sept. 18, the fiftieth anniversary of the initial publication of the New York Times was celebrated by the issuing of a historical and commemorative number. On Nov. 10, the corner-stone of the new building for the Chamber of Commerce was laid on Liberty Street, between Nassau Street and Broadway.

NICARAGUA, a republic of Central America. The Congress by the provisions of the Constitution of Dec. 10, 1896, consists of a single chamber

of 40 members elected by universal adult male suffrage for two years. The President is elected by the direct popular vote for a term of four years. Gen. José Santos Zelaya was chosen President of the republic for the term ending Jan. 1, 1902. The Cabinet consisted at the beginning of 1901 of the following members: Minister of the Interior, Justice, Police, and Ecclesiastical Affairs, Gen. Fernando Abaunza; Minister of Foreign Affairs and Public Instruction, Dr. Fernando Sanchez; Minister of Finance and Public Credit, Col. Felix Pedro Zelaya; Minister of Public Works, Dr. Leopoldo Ramirez Mairena.

Area and Population.—The republic has an area of 49,200 square miles, with about 450,000 inhabitants, mostly Indians, with an admixture of negro blood. There were 2 universities and 10 colleges with 308 instructors, and 323 primary schools with 323 teachers and 17,803 pupils in 1900.

Finances.—The revenue for the calendar year 1898 was \$4,009,603 in silver, and the expenditure \$4,824,138. Of the revenue \$1,604,425 were derived from customs, \$1,059,946 from duties on liquor and tobacco, \$192,395 from a tax on cattle slaughtered, \$590,475 from railroads, posts, and telegraphs, and \$562,462 from stamps, the gunpowder and other monopolies, and an export duty on cattle. Of the expenditure \$1,809,131 were assigned to the Ministry of War, \$852,430 to the Ministry of Public Works, \$781,204 to the Ministry of Finance, \$325,070 to the Ministry of Public Instruction, \$477,462 to police, \$391,308 to the interior, and \$153,880 to justice. The budget estimate of revenue for 1900 is \$6,408,000, of which customs produce \$3,375,000, the liquor and tobacco duties \$1,360,000, the slaughter tax \$200,000, the export duty on coffee \$200,000, the export duty on cattle \$60,000, and railroads, posts, and telegraphs, and other services \$903,000. The expenditure for 1900 was estimated in the budget at \$6,414,951, of which \$1,066,070 were for the Ministry of War and Marine, \$2,454,912 for the Ministry of Finance, \$1,153,378 for the Ministry of Public Works, and \$471,792 for the Ministry of Public Instruction. About 2,000 men are maintained as the regular army, with 10,000 in the reserve and a National Guard of 5,000.

The external debt was raised in London in 1886 to build railroads. The Government defaulted in the payment of interest in 1894, and in 1895 made an arrangement with the creditors to reduce the future interest from 6 to 4 per cent. and that in arrears to 3 per cent. The original loan was £285,000 sterling. On July 1, 1900, the amount outstanding was £272,100, besides £6,505 of coupons unpaid. The internal debt was \$7,782,810 in 1898.

Commerce and Production.—Cattle-raising was the chief occupation of the people until settlers from Germany and the United States introduced the planting of coffee and bananas. Cacao is grown for local consumption. There are about 400,000 cattle, and the export of hides is still considerable. Rubber was one of the main articles of export, but from Jan. 1, 1898, its exportation has been prohibited, excepting from the department of Zelaya, formerly the Mosquito Territory. The rubber-tree has recently been planted extensively. The sugar production in 1899 was 65,000 hundred-weight; the production of spirits, 838,373 liters. There are 109 mines worked by American, a few by British companies. Most of the ores contain both gold and silver, some of them silver with copper. The export of gold bars and dust increased from 8,000 ounces in 1895 to 16,242 ounces in 1898.

The total value of imports by sea in 1899 was \$5,236,165, of which \$2,995,741 came through Pacific and \$2,995,741 through Atlantic ports. The exports were \$6,981,472 in value, \$3,686,156 by way of Pacific and \$3,295,316 by way of Atlantic ports. Cotton goods were imported from the United States and Great Britain, woollens from Great Britain, knit goods from Germany and France, machinery, tools, and hardware from the United States, earthenware from Germany and France, and preserved meats from France and Italy. The exports of coffee were 45,000 hundredweight to Germany, 15,000 hundredweight to England, 15,000 hundredweight to France, 6,000 hundredweight to the United States, and 4,000 hundredweight to Italy. Rubber was shipped to the United States, gold to the United States and Great Britain, hides to the United States, dyewoods and cabinet woods to Great Britain, Germany, and the United States. The export of spirits to Spanish-American countries was 18,737 liters, and 26,000 hundredweight of sugar was shipped to California.

Navigation.—There were entered in 1898 at Corinto, the port through which two-thirds of the foreign trade passes, 78 vessels, of 114,161 tons, of which 35, of 57,050 tons, were American and 27, of 46,454 tons, German. This does not include coasters, of which 104, of 62,886 tons, were entered.

Railroads, Posts, and Telegraphs.—The railroads, all belonging to the Government except one short line, connect with steamers on Lake Nicaragua and Lake Managua. They have a total length of 140 miles. A new line connecting with the railroad to Corinto at Masaya has been carried into the coffee-growing district to Jinotepe, and is being extended to Diriamba.

The post-office in 1896 received 1,376,366 pieces of mail-matter. There are 1,245 miles of telegraphs.

The Projected Nicaragua Canal.—A modification of the Clayton-Bulwer treaty of 1850, providing for the joint Anglo-American protection of any canal across the American isthmus, was negotiated and signed on Feb. 5, 1900; but, failing to obtain the ratification of the United States Senate, it lapsed on March 4, 1901. Negotiations were afterward resumed. Great Britain wanted to stipulate that the United States should build no fortifications on the canal or its approaches, and should covenant to keep it open on equal terms to the ships of all nations in peace or war.

The commission appointed to make a detailed study of the routes for an interoceanic canal found the Panama and Nicaragua routes both practicable. Nicaragua had the advantage of proximity to the Atlantic and Pacific seaboards of the United States, Panama that of shorter canal transit and less liability of the waterway being accidentally blocked, and also of having part of the work already done, though this was offset by the excavated earth having to be moved again for a canal of wider dimensions than the original plans called for. A settlement with the original Panama stockholders and the new company representing their interests and with the French and the Colombian governments was, moreover, difficult and complicated, and after long negotiations several times interrupted no satisfactory offer was yet received from the directors of the existing French Panama Company. Before the Nicaragua Canal could be constructed under the auspices of the United States Government, not only had the old agreement for its joint protection and control by the United States and Great Britain to be rescinded, but territorial arrangements had to be made with Costa Rica as well as Nicaragua.

Nicaragua had treaties with various nations, containing provisions relative to the projected waterway, some of which promised concessions in respect to the use of the canal which Nicaragua could not fulfil if the United States had sole control. These treaties, which would prove embarrassing to both Nicaragua and the United States, the Nicaraguan Government denounced, and also the treaty of 1867 with the United States granting to the United States the right of transit across the territory of the republic by any route, providing for the protection by the United States and the neutrality of all routes of communication, requiring Nicaragua to establish free ports at each end of the route chosen, giving to the United States the right to transport troops and munitions of war provided they were not to be used against any South American power with which Nicaragua was at peace, prohibiting Nicaragua from imposing tolls on the goods or persons of citizens of the United States or of any foreign country higher than were imposed on the goods or persons of citizens of Nicaragua, and permitting the transport of the United States mail by any route of communication. The general provisions of the treaty of 1867, which expires on Oct. 24, 1902, a year from the date of its denunciation, form the basis of a new treaty of commerce and navigation to be negotiated between the two governments. Secretary Hay and Luis F. Corea, the Nicaraguan minister in Washington, signed an agreement in 1901 by which Nicaragua recognizes the right of the United States to construct the canal, and engages to lease the territory through which the canal route passes, including a strip on either side, the lease being equivalent to the cession of the land and sovereign rights over it for so long a period as the canal is maintained under the conditions agreed upon. Freed from all treaty stipulations with any other Government, Nicaragua was able to enter into negotiations with the United States for a new canal treaty embodying the concessions already agreed upon or any others deemed necessary or desirable for the construction of the canal by the United States. The United States, however, was not free to conclude the necessary arrangements until the obligations of the Clayton-Bulwer treaty were canceled. The congressional resolutions declared the treaty to be abrogated, but the Government could not annul its legal obligations by one-sided action. The treaty had no term of years to run or provision for its termination by notification on the part of either of the signatory governments. It could only be terminated or superseded by mutual agreement without a breach of international law. The action of the Senate made negotiations more difficult with a government pertinacious in preserving treaty rights even when they are of no value except as a diplomatic weapon. A new treaty was finally concluded on Nov. 16 and signed at Washington by John Hay in behalf of the United States and Lord Pauncefoot in behalf of Great Britain. Its object was stated to be to facilitate the construction of a ship canal to connect the Atlantic and the Pacific Oceans by whatever route may be considered expedient, and to that end to remove any objection that might arise out of the Clayton-Bulwer convention of April 19, 1850, to the construction of such canal under the auspices of the Government of the United States without impairing the general principle of neutralization established in that convention.

In the treaty previously negotiated, but rejected by the Senate, Great Britain stipulated not only that the canal should remain neutral and

open in peace and war, and should be defended against attack by belligerents, but that other nations should be invited to adhere to these provisions, the rules adopted in the international agreement governing the Suez Canal having been taken as a model. The right of the United States, when called upon to defend itself, to fortify the canal and exclude the vessels of the enemy could not in any case be restricted by treaty, since a state of war abolishes all treaties between belligerents. A clause permanently insuring the neutrality of the canal which is only binding as against neutrals was not objectionable, but any partnership with Great Britain in the responsibility of defending this neutrality was, and so was the stipulation that other nations should be invited to adhere to provisions promising the neutrality of the canal in peace or war and forbidding its fortification or military occupation by the United States. The first article of the new canal treaty with Great Britain states that this treaty supersedes the Clayton-Bulwer convention of April 19, 1850. In the second article it is agreed that the canal may be constructed under the auspices of the Government of the United States, either directly at its own cost or by gift or loan of money to individuals or corporations or through subscription to or purchase of stock or shares, and that, subject to the provisions of the treaty, the United States Government shall enjoy all the rights incident to such construction, as well as the exclusive right of providing for the regulation and management of the canal. The neutrality of the canal for the use of all nations is permanently secured, while this article making the United States the sole guarantor of its neutrality relieves Great Britain of all the responsibility and obligation to enforce them, such as the Clayton-Bulwer treaty imposed upon and which were assumed by Great Britain jointly with the United States. Instead of the provision that the rules of neutrality should be adopted by both nations, the United States alone adopts them and undertakes to carry them out. Any nation observing the rules laid down in the treaty is permitted to enjoy the use of the canal, but no nation is to be consulted as to its construction, operation, or maintenance. In the third article the United States adopts as the basis of the neutralization of the canal substantially the same rules that are embodied in the Constantinople convention of Oct. 28, 1888, for the free navigation of the Suez Canal. These rules guaranteeing the neutrality of the canal and equal treatment of the citizens of all nations are recapitulated as follow: 1. The canal shall be free and open to the vessels of commerce and of war of all nations observing these rules so that there shall be no discrimination against any such nation or its citizens or subjects in respect of the rules on terms of entire equality, conditions or charges of traffic, or otherwise. Such conditions and charges of traffic shall be just and equitable. 2. The canal shall never be blockaded, nor shall any right of war be exercised nor any act of hostility be committed within it. The United States, however, shall be at liberty to maintain such military police as may be necessary to protect it against lawlessness and disorder. 3. Vessels of war of a belligerent shall not revictual nor take any stores in the canal except so far as may be strictly necessary, and the transit of such vessels through the canal shall be effected with the least possible delay in accordance with the regulations in

force and with only such internal arms as may result from the necessities of the service. There shall be in all respects subject to the same regulations vessels of war of the belligerents. 4. No troops shall embark or disembark troops or arms in the

war or warlike materials used in the canal except in case of accidental hindrance of the transit, and in such case the transit shall be resumed with all possible despatch. 5. The provisions of this article shall apply to waters adjacent to the canal within three marine miles of either end. Vessels of war of a belligerent nation shall not remain in such waters longer than twenty-four hours at any one time except in case of distress, and in such case shall depart as soon as possible, but a vessel of war of one belligerent shall not depart within twenty-four hours from the departure of a vessel of war of the other belligerent. 6. The plant, establishments, buildings, and all works necessary to the construction, maintenance, and operation of the canal shall be deemed to be parts thereof for the purposes of this treaty, and in time of war, as in time of peace, shall enjoy complete immunity from attack or injury by belligerents and from acts calculated to impair their usefulness as part of the canal.

By the fourth article it is agreed between the contracting parties that no change of sovereignty or of international relations of the country or countries traversed by the ship canal shall affect the general principle of neutralization or the obligations of the contracting parties. The fifth and last article provides for the exchange of ratifications at the earliest possible time within six months of the signature of the treaty, the exchange to take place either in Washington or in London.

The canal commissioners, after examining both routes and the plans and estimates previously made for the completion of the Panama Canal and the construction of one by the Nicaragua route, concluded that the Nicaragua Canal could be built for \$63,500,000 less than the purchase and completion of the Panama Canal would cost, taking the latest and lowest price set by the Panama Canal Company on its franchise and uncompleted excavations. The valuation placed by the commission on the Panama property was \$40,000,000. The total cost for a Nicaragua canal 183.66 miles in length, 300 feet wide, and 35 feet deep, with 4 double locks on each side of Lake Nicaragua and a great dam at Conchuda for regulating the flow of the San Juan river in wet and dry seasons by means of sluices, including a great harbor at Greytown protected by jetties and one at Brito, on the Pacific side, with a jetty, and also 100 miles of railroad at \$75,000 a mile for the conveyance of materials, is estimated at \$189,864,062. The harbor at Greytown, which had 50 feet of water in the middle of the last century, is little better than a lagoon, having nowhere more than half that depth, and only 6 feet of water over the bar. Much less dredging will be necessary at Brito, where the silting is slight compared with Greytown, and the cost of maintenance is therefore much less. The entrance to the canal on both sides will be 500 feet wide and 35 feet deep, and each harbor will have a turning basin 1,800 feet broad, and both will be protected by jetties 3,500 feet long. Lake Nicaragua is 100 miles long and 45 miles wide. For 59 miles the canal runs through its bed, and for 50 miles in the channel of the San Juan river. For 22 miles the lake must be dredged out to give the required depth. The enormous dam on the San Juan river will control the fluctuation of level in the lake, which is 110 feet above the sea in flood and 97 feet in dry weather. The site of the dam is just above the point where the San Carlos river flows into the other, discharging from 100,000 to 200,000 cubic feet of water a second. The dam will cost \$4,000,000, but the cost at the site originally selected

would be \$15,000,000. The auxiliary waste way will add \$2,000,000 to the cost. From Greytown harbor to the first lock the canal runs for 7 miles through swamp, and will cost, including the expense of diverting the San Juan and San Juanillo rivers, over \$5,000,000. The lock will cost nearly \$6,000,000; the section of 11 miles from there to the next lock, including embankments, approach walls, waste way, and the lock itself, will cost nearly \$1,000,000 a mile; in the next section of 17 miles the cost rises to \$1,250,000 a mile. Between the third and fourth locks is a short section of $2\frac{1}{2}$ miles, and after another section of $5\frac{1}{2}$ miles to the fifth lock the canal merges in the San Juan river above the Conchuda dam. These short sections with the dam between them will cost over \$2,000,000 a mile; the San Juan section, a little under 50 miles, not \$500,000 a mile; the Lake Nicaragua section of $70\frac{1}{2}$ miles, a little over \$112,500 a mile, no dredging being needed for 50 $\frac{1}{2}$ miles where the route passes through the middle of the lake. West of the lake for nine miles to the fifth lock the ground rises up to the divide, and here heavy excavation must be made for the canal bed and for great receiving basins intercepting the Rio Grande, Las Lajas, and Chocolate rivers, so that the total cost of this section will be above \$24,500,000, and \$7,500,000 more for the $2\frac{1}{2}$ miles, and including the sixth lock, and over \$7,000,000 more for two miles to and including the seventh lock. To the eighth and last lock it is $2\frac{1}{2}$ miles, and this section will cost nearly \$6,000,000. In the rapid descent the canal follows the valley of the Rio Grande river, which it is necessary to divert from its channel in the sections between the sixth and the last locks. The eighth lock lets vessels down into salt water $\frac{1}{2}$ mile from Brito harbor, and this end section will cost \$500,000. For engineering sanitation, police, and contingencies the estimate of \$158,220,000 for construction is increased 20 per cent., or \$31,614,000. In the earlier surveys the route was 3 miles longer and the plans called for one more lock. The length of canal to be cut is about 74 miles, the length of river and lake 110 miles. There are several deep cuts, one of 200 feet near the Conchuda dam, one of 297 feet at Tamborcito, 26 miles from Greytown, through a ridge of hard rock 3,000 feet thick near the San Juan river. The canal is to have a system of double locks, so that in case one is disabled or closed for repairs traffic will not be interrupted.

NORTH CAROLINA. (See under UNITED STATES.)

NORTH DAKOTA. (See under UNITED STATES.)

NORTHWEST TERRITORIES OF CANADA. Population in 1901, 220,000. Capital, Regina. This part of the Dominion comprises the districts of Assiniboia, Alberta, Saskatchewan, and Athabasca, with the unorganized divisions of Franklin, Keewatin, Mackenzie, and Ungava, and embraces 2,497,427 square miles.

Government.—The Government has changed considerably, in a constitutional sense, in recent years. F. W. G. Haultain, B. A., has, however, been the leading figure in its Council and Executive Committee and finally in its Assembly since 1887. In October, 1897, he became the Territorial Premier, and in the beginning of 1901 he was also Attorney-General and Commissioner of Education. With him were J. H. Ross as Commissioner of Public Works and Treasurer and G. H. V. Bulyea as Commissioner of Agriculture and Territorial Secretary. During preceding years Messrs. Hillyard Mitchell, J. R. Neff, and C. A. Magrath had been associated with him in the Government.

On March 2, 1901, James Hamilton Ross, who had been a member of the Executive Committee or Government since 1895, resigned to accept the Dominion post of Commissioner of the Yukon, and was succeeded by Arthur Lewis Sifton. He was reelected by acclamation. On March 22 two by-elections took place, and the previous members, who had resigned to contest seats for the Commons, were returned by large majorities. Both were Conservatives, but R. B. Bennett was an opponent of the Haultain Government, while R. S. Lake was a supporter.

Legislation.—The Assembly at the beginning of the year had 12 Conservatives, 9 Liberals, and 10 who were either independent or without party affiliations. The Haultain Government had, however, a substantial majority, the Conservative Premier having a large liberal support. He was strongly opposed during the year by many Conservatives.

The Legislative Assembly was opened on May 2, 1901, at Regina, by Lieut.-Gov. Amadée Emanuel Forget. William Eakin was Speaker, Mr. Haultain Premier, and D. H. McDonald, a Liberal in politics, was leader of an opposition that included several Conservatives. The speech from the throne included the following passages:

"In common with the rest of Canada, you must be gratified at the splendid service done on behalf of the empire by our fellow citizens in South Africa. That some of those who volunteered their services have lost their lives must be a cause of the deepest sorrow, and I am sure that you will join me in expressing the greatest sympathy for the relatives and friends of those who have fallen as well as the heartiest welcome to those who have returned.

"In addressing you on the occasion of your last meeting I referred to 'the great disproportion existing between the means at command and the ever-growing necessities of the rapidly increasing population of the territories.' As those necessities have still continued to grow with our population, and there is no substantial increase to the revenue apparently to be looked for, I feel it my duty to call your attention to the absolute impossibility of supplying the ordinary services of the territories with the means at your command.

"During the past few months smallpox, which has been epidemic in all States of the American Union immediately to the south of us, and also in a number of the provinces of the Dominion, made its appearance at several points in the territories. Measures were taken to prevent the spread of the disease, and I am happy to be able to inform you that it is being rapidly stamped out.

"The great losses to crops annually caused by hail-storms, and the hitherto unsatisfactory system of hail insurance conducted as a private enterprise, have led my Government to consider the subject, and a measure will be submitted to you by which it is hoped an effective and economical system of insurance against losses by hail, administered by the Government, will be offered to those wishing to take advantage of it.

"You will be asked to consider a bill to amend and consolidate the law relating to joint-stock companies, by which a more simple and inexpensive process of formation will be provided, and a more complete and comprehensive system regulating companies and cooperative enterprises introduced. Legislation will also be introduced having in view the simplification of the law relating to the establishment and conduct of rural school districts and the method of assessment therein. The desirability of the readjustment of

the basis upon which the local taxes levied in aid of schools are at present made, is also fully recognized, and proposition in regard to this subject will be submitted to you at an early date.

"Your attention will be directed to the enlarging the scope of the Public Works Department by providing means whereby the present impassable may be improved by a drainage-works, as well as simplifying and improving the manner of dealing with the vexed question of roadways. Measures will be submitted for your consideration amending the law respecting steam-boilers, liquor licenses, the administration of civil justice, villages, and local improvement."

Finances.—The public accounts for the year ending Dec. 31, 1900, showed total receipts amounting to \$467,185, and expenditures of the same amount. The revenue included a Dominion grant of \$307,979 for schools, etc., a special grant of \$92,000 to restore public works destroyed by floods, and \$4,000 for another purpose. The sum of \$11,159 represented a reimbursement for certain repairs by the Dominion Public Works Department, and \$4,452 was Dominion interest on school lands. Thus \$419,000 of the revenue was derived from Ottawa. There were a few minor items, such as \$1,200 for licenses to foreign companies, \$1,415 for marriage licenses, \$3,584 for steam-boiler and engineer certificates, \$3,671 received in the Department of Agriculture, and \$30,492 obtained from liquor licenses. The expenses included \$43,951 for civil government, \$22,360 for legislation, \$8,471 for administration of justice, \$175,826 for public works, \$187,741 for education, \$17,216 for agriculture and statistics, \$9,163 for hospitals, charities, and sundries. The local improvement districts trust account showed taxes collected amounting to \$13,384, and expenditures of \$10,188.

The budget speech was delivered by A. L. Sifton in the Assembly on June 7, 1901. He first spoke of the services rendered to the country by the Hon. J. H. Ross, who for so many years had filled the office of Territorial Treasurer. The direct revenue from the Dominion Government for the current year would, he estimated, be \$345,000, and this, with various small and special taxes, would make a total of \$413,000 as the actual revenue to be received. The territories were dependent upon the Dominion Government in financial matters, and their population was too small to permit of any heavy specific taxation. It had therefore been difficult to make ends meet, and the estimates of expenditure for the current year were based upon a promise from the Dominion authorities that their grant on Jan. 1, 1902, would be \$600,000. The estimates in many cases would show an increase over the previous year, and this was especially so in the vote for civil government, to which recent additions to the salaries of members of the Government had been charges. In the Public Works Department there would be an increase from \$187,000 to \$258,000. The amount actually required for what were considered public requirements was \$400,000. There was an increase in the educational grant of 10 per cent., caused by the growth of the population. The Government had gone as far as it was wise to go in taxing the people for local improvements, and yet the stage had not been reached where it was possible to do what ought to be done in necessary constructive work. The whole matter of financial receipts from the Dominion was loosely managed and insufficient for the purpose. "There is no difference of opinion throughout the Northwest Territories as to the fact that we

are not getting and can not get, under present conditions, the amount of money proper to carry on the affairs of the country." The mounted-police force were getting as large a grant as the territorial Government was receiving for carrying on the agriculture, public works, and education of the whole vast region under their care. He estimated \$900,000 as a fair amount under conditions in which they would assume certain responsibilities now accepted by the Dominion.

Education.—The number of school districts erected in 1900 was 49, against 51 in the previous year; the schools in operation numbered 492, against 454 in 1899; the number of pupils enrolled was 20,343 and 18,801 respectively. The average attendance in 1900 was 9,430, and the total grants earned by all the schools was \$163,014, against \$147,547 in 1899. The receipts for the year included \$27,346 of balances in hand on Jan. 1, 1900, \$150,656 from Government grants, \$185,823 from taxes collected during the year, \$67,502 as proceeds of debentures—making a total, with other miscellaneous sums, of \$489,566, against \$416,005 in 1899 and \$340,261 in 1898. The expenditures were \$455,855, including \$234,976 for teachers' salaries, \$79,353 for school buildings and repairs, and \$32,259 for debenture indebtedness. There were \$73,590 due to school districts, chiefly arrears of taxes, and \$156,621 due by school districts. There were 353 licenses to teach granted in 1900, of which 181 were to women and 172 to men. Of the 592 teachers who taught in the territories in 1900, all but 5 per cent. had professional or normal training. The average monthly salary paid to teachers was \$44.39 for the time during which they taught.

Coal.—The production of coal in the territories in 1900 appears, from all accounts, to have increased, but the export decreased from 61,618 tons in 1899 to 31,888 tons in 1900. In his annual report, J. H. Ross declared, under date of Feb. 26, 1901, that the output of 22 mines was 303,730 tons of bituminous coal and 17,549 tons of anthracite. Coal-mining provides occupation for 800 men, and the annual output at nearly all the mines is rapidly increasing.

Agriculture.—G. H. V. Bulyea, Commissioner of Agriculture, presented his annual report on March 1, 1901. The statistics showed a considerable decrease from the preceding year in most of the chief lines of production. Reasons varied in the different districts and territories, but climatic changes seem to have been the main causes. Taking a three-year period as presenting the fairest view of the matter, wheat showed a product of 5,542,478 bushels in 1898, 6,915,623 bushels in 1899, and 4,028,294 bushels in 1900. The acreage was respectively 307,580, 363,523, and 412,864, while the yield per acre was 18.01 in 1898, 19.02 in 1899, and only 9.75 in 1900. In oats the production was 3,040,307 bushels in 1898, or 28.93 to the acre; 4,686,036 bushels in 1899, or 34.81 to the acre; 4,226,152 bushels in 1900, or 24.08 to the acre. In barley the production was 449,512 bushels, or 26.29 to the acre, in 1898; 337,421 bushels, or 23.62 to the acre, in 1899; 353,216 bushels, or 20.72 to the acre, in 1900. Some progress was made in the work of the 19 Government creameries. The number of pounds of butter manufactured increased by 135,000, while the quantity of milk supplied diminished, and the quantity of cream increased. The patrons numbered 1,169 in 1900, the inches of cream supplied were 560,989, the pounds of milk 46,211, against 1,303,221 in 1899, and the pounds of butter made were 637,052, against 501,907 pounds in 1899 and 484,948 pounds in 1898.

The prices of cattle varied throughout the ter-

ritories during the year. Exported cattle from the Calgary and Lethbridge districts brought about \$50 a head, while \$40 to \$42 a head was paid for light cattle. Elsewhere prices went from \$40 to \$45. As a rule, the stockmen obtained \$50 a head for four-year-olds and \$45 for three-year-olds. Yearlings ranged from \$16 to \$18, and two-year-olds from \$23 to \$27.50. The total export of cattle from the territories in 1900 was 55,129 head, compared with 41,471 in the previous year. According to C. W. Peterson, Deputy Commissioner of the Department of Agriculture, "an interesting feature of the cattle business in the territories is the movement from Ontario, Manitoba, and the farming districts of the territories to southern Alberta and western Assiniboia. The importations from Ontario amounted to 11,434, from Manitoba 24,896, from Saskatchewan 738, from eastern Assiniboia 4,996, and from northern Alberta 222, making the total influx of cattle into the ranching districts of the territories 42,286."

The sheep industry of this region in 1900 was prosperous, the total stock 225,000, the home market for wool favorable, and the export market for mutton unlimited. Yet there was no tendency to expansion in the industry. Most of the mutton produced during the year went to British Columbia, and some large shipments of Assiniboia sheep went to Winnipeg. In swine, the territories are reaching the point of supplying the local demand. In 1900 only 670 head of hogs were imported, against 1,925 head in the previous year. Extensive pork-packing establishments have been erected at Edmonton and Calgary.

Autonomy.—The problem of making the territories, with their great area and small population of 98,967 in 1891 and 220,000 in 1901, into a province, came up for practical discussion and preliminary arrangement this year. Dr. T. A. Patrick, M. L. A., in 1898, and Mr. F. W. G. Haultain in 1900, had expressed themselves very strongly in favor of some kind of action to relieve the territories of their disabilities and financial difficulties. The Premier had declared the position to be impossible and the present financial and administrative powers entirely inadequate. In the constitutional sense, there were difficulties over the election law, and the territorial Legislature possessed no power to disqualify a man for membership in its own body. There was no authority to administer criminal justice. Only part of the civil jurisdiction had been granted, and this made two sets of officers necessary. There was no control over the Registry Office, and certain powers were greatly controlled by the federal land titles act. On the other hand, it may be pointed out, the Dominion Government paid all the expenses of the police, the administration of justice, the Lieutenant-Governor's office, the registrar's, the care of the insane, etc., besides giving a direct grant for educational and miscellaneous purposes. These sums amounted, for the year ending June 30, 1900, to \$742,775, but the amount actually granted the Territorial Government was inadequate to their financial needs, and continuous requests for aid were going to Ottawa. Hence the agitation for a new status and revised conditions. The proposals were various and included the annexation of a portion of the eastern section of the territories to Manitoba; the establishment of Saskatchewan and part of Alberta into one province; the centralization of all the districts in one great province; and their division into two provinces.

Annexation to Manitoba.—On March 28 the subject came up for discussion in the Legislature

of Manitoba. T. A. Burrows, in the course of his speech, referred to the smallness of Manitoba and the great area of Ontario, Quebec, and British Columbia. He said that the boundaries defined in 1871 were provisional and tentative, and reviewed the litigation by which Manitoba lost to Ontario about 100,000 square miles. It would now be only fair for the Dominion to help the province by giving it a portion of the territories. To the north was the great district of Keewatin, with important resources and 450,000 square miles of territory, and between it and Hudson Bay, which they were so anxious to connect by rail, was a wedge of the district of Saskatchewan. A rearrangement could be made so as to extend Manitoba in these directions. He concluded by moving the following resolution, which was approved by the Hon. Mr. Greenway and carried unanimously:

"Whereas, The territorial area of the province of Manitoba is small in comparison with the areas of most of the other provinces of the Dominion of Canada, while the machinery of government is as full and complete as would be necessary to govern and administer the affairs of a much larger territory; and

"Whereas, There are districts adjacent to the province of Manitoba that should be comprised within the limits thereof, for the purpose of provincial autonomy, their agricultural, commercial, and educational interests being in a great measure common, and a union thereof would tend to develop and strengthen same; and

"Whereas, In the formation of the said adjacent territory into provinces it is advisable in the public interests to include in the province of Manitoba as much of the area as possible consistent with economical administration; therefore let it be

"Resolved, That a memorial be presented to the Parliament of Canada praying that the boundaries of the province of Manitoba be extended so as to include as much of the said adjacent territory, for the reasons aforesaid, as may be consistent with economical and efficient government and for the welfare and development of the people and territory therein comprised, having in view as one of the objects to be attained the extension of the boundaries of Manitoba northward to Hudson Bay."

In the House of Assembly, at Regina, on May 20, D. H. McDonald, leader of the Opposition, moved a resolution upon this subject, without remark or comment:

"That, in the opinion of this house, no terms should be accepted for the erection of the territories into a province or provinces entailing the annexation of any portion thereof to the province of Manitoba."

The Premier followed and criticized the mover for having nothing to say. He pointed out that the Assembly had no power to accept or reject terms in regard to the boundaries of Manitoba. They could only discuss financial arrangements under the existing constitutional status, and even then they could only propose and recommend. He therefore moved in amendment, seconded by Mr. Bulvey, that

"This house is strongly opposed to any further expansion of the province of Manitoba westward, and is of the opinion that any such expansion would be opposed to the wishes and detrimental to the interests, not only of any portion of the territories affected thereby, but of the territories as a whole."

Prohibition.—In the Legislature, on June 12, Dr. Elliot moved, seconded by A. S. Smith, a

resolution declaring that the evil effects of intemperance upon intemperance were insupportable, and that the enactment and enforcement of total prohibition of the liquor traffic was the only effective method of dealing with the evil; that public opinion in the territories, as evidenced by the recent plebiscite on prohibition, was in favor of such a policy; that the electors should have an opportunity of expressing themselves upon the subject; and that at the next territorial election the question should be submitted to them; that should such a plebiscite show three-fifths of those voting to be in its favor, an act should be passed putting the principle in force within two years from the date of the plebiscite. A. B. Gillis opposed the motion and did not think it possible to enforce such a law. Dr. Patrick was in favor of a state monopoly and control of the liquor traffic. Mr. A. S. de Rosenroll moved as an amendment to the resolution that: "In the opinion of this Assembly the interests of temperance would be promoted by a system of state monopoly of the liquor traffic. Therefore, be it resolved that the Government make inquiries into the working of this system in other countries where it has been adopted, with the object of the introduction of such system into the territories." Mr. Haultain approved of the amendment and declared that he had never believed in the practical application of prohibition. Certainly the territories had not arrived at a stage when it could be effectively enforced. Mr. R. B. Bennett opposed the amendment, though there was also much in the resolution with which he could not agree. A prohibition law, in the present state of public opinion, would be laughed at and be worse than useless. Education and temperance instruction in the schools was the best way of dealing with the evil. The amendment was carried by a vote of 16 to 9.

NOVA SCOTIA, a maritime province of the Dominion of Canada; area, 20,907 square miles; population in 1901, 459,116. Capital, Halifax.

Government and Legislation.—The Government that controlled the province at the beginning and throughout the year was a continuation of the Liberal ministry of W. S. Fielding, which had held office from July 28, 1884, until July 17, 1896, when the Premier resigned in order to accept a portfolio at Ottawa. He was succeeded by the Hon. George Henry Murray, K. C., who had been a member of the Government several years. At the opening of the year the Cabinet stood as follows: Premier and Provincial Secretary, G. H. Murray; Attorney-General, J. W. Longley; Commissioner of Works and Mines, C. E. Church; members without portfolios, Thomas Johnson, A. H. Comeau, A. McGillivray, T. R. Black, W. T. Pipes, D. McPherson. At the end of August, C. E. Church, who had held his portfolio seventeen years, retired and was succeeded by Arthur Drysdale, of Halifax, who had sat in the house since 1891. The Hon. F. A. Laurence was Speaker of the Assembly, as he had been since 1894, and the Hon. Robert Boak was president of the Legislative Council. Messrs. N. J. Gillis, D. D. McKenzie, M. J. Keefe, C. E. Tanner, and A. M. Stoneman were introduced as newly elected members of the Assembly, and the Hon. W. B. Law and Hon. William Chisholm as newly appointed members of the Council. The Legislature was formally opened Feb. 14, with a speech from the throne, of which the following are the significant portions:

"The year which recently closed was on the whole one of very great prosperity in Nova Scotia. In most of the departments of industry in which

our people are employed labor was rewarded by a good return. The development of our coal-mines continues to afford much satisfaction. In connection therewith we can not fail to observe with gratification the progress that has been made in the creation in the island of Cape Breton of great industries for the manufacture of iron and steel.

"Gratifying progress was made during the year in the work of railway extension. The Inverness and Richmond Railway is approaching completion, and the same may be said of the Midland Railway between Windsor and Truro. The projects for the construction of a railway from Halifax to Yarmouth through the south shore counties of the province have not made desirable progress.

"The desirability of larger provision for the promotion of agricultural education will be generally recognized. My Government, regarding this as a movement in which the three maritime provinces might properly cooperate, invited a conference with the governments of the sister provinces of New Brunswick and Prince Edward Island. The representatives of the three governments have agreed on a scheme for the establishing of an agricultural college, subject to the approval of their respective legislatures.

"With the growth of the province comes the need of increased accommodation in those humane institutions which always enlist the interest and sympathy of our people. You will be invited to consider the expediency of enlarging the Victoria General Hospital and the Nova Scotia Hospital.

"The work of preparing and issuing the sixth series of the Revised Statutes of Nova Scotia has been completed, and the volume is now available to the public.

"I am pleased to be able to inform you that the finances of the province are in a very satisfactory condition.

"Measures will be submitted for the protection of the interests of the settlers in future leases of Crown lands, for the further encouragement of dairying, and for the inspection of public offices."

The following were the principal acts passed at this session:

Respecting aid to a railway between Halifax and Yarmouth.

For the protection of persons employed in factories.

To amend chapter lxxiv, Revised Statutes, 1900, "Of the encouragement of manufacturing and shipbuilding by exemptions from taxation."

To amend chapter lviii, Revised Statutes, 1900, "Of the encouragement of agricultural and technical education."

To encourage horticulture.

To amend chapter lii, Revised Statutes, 1900, "Of public instruction."

To amend chapter lii, Revised Statutes, 1900, "The education act."

To amend chapter xxi, Revised Statutes, 1900, "The mines arbitration act."

To amend the coal-mines regulation act.

To amend chapter xxiii, Revised Statutes, 1900, "Of miners' relief societies."

To amend the succession duty act.

To encourage the building of cold-storage warehouses and plant therein.

To amend chapter cxix of the Revised Statutes, 1900, entitled "Prevention of the use of tobacco and opium by minors."

To encourage the building of steel and iron ships in the city of Halifax.

Several acts concerning the charters of coal, iron, electric, and railway companies.

Finances.—On March 5 the Premier and Provincial Treasurer made his annual financial statement for the year ending Sept. 30, 1900. He referred to the almost stationary condition of the revenue that had prevailed for many years in the province, but was now, happily, a thing of the past. During the past three years there had been a substantial balance on the right side, and the Government had been able to deal liberally with the great services of the province, such as education, charities, roads and bridges. Yet they had not been compelled to do as the other provinces had done—resort to direct taxation to make ends meet. Not a dollar was collected from the liquor traffic, nor was there any taxation of home or foreign corporations. In this respect the only change since confederation had been the imposition of succession duties. Wise legislation in dealing with the mineral development of the province was, he believed, the cause of this stability of position. The revenues in 1896 were \$841,159; in 1897, \$832,240; in 1898, \$855,960; in 1899, \$876,827; in 1900, \$1,014,123, in place of the estimated income of \$948,906. The largest item in this amount was the allowance from Ottawa, which last year was \$432,806, and included the federal subsidy and the interest on \$1,056,128 still held by the federal authorities to the credit of the province. During the year under consideration the royalties on mines and minerals had amounted to \$413,874. The average yearly production of coal had increased from 906,268 tons in 1874-'84 and 1,587,959 tons in 1885-'91, to 2,078,065 tons in 1892-1900. The average royalty had grown from \$66,698 in 1874-'84 and \$121,304 in 1885-'91, to \$224,112 in 1892-1900.

Another important source of revenue was the succession duties. The estimate for the year had been \$25,000; the amount received was \$29,688. The estimate from hospitals had been \$47,000; the returns were \$48,574. The other items were small. The total expenditure was \$937,261, leaving a stated surplus of \$76,861. The chief items of expense were as follow: Agriculture, \$39,018; debenture interest, \$147,413; education, \$250,365; public charities, \$128,180; road grants, \$90,850; Legislature expenses, \$50,775; steamboats, packets, and ferries, \$40,864; provincial engineers' office, \$10,909; mines office, \$23,975; Public Works Department, \$24,436; miscellaneous, \$68,028. These amounts, with other items, made up a total of \$937,261.

The expenditure on capital account for the year was \$292,368, including \$77,667 on bridges; \$6,864 on the construction of smaller bridges; \$205,000 for railway subsidies; and \$2,831 on road-making machinery. The total liabilities of the province on Sept. 30, 1900, were \$4,059,517, and against this amount the chief asset was \$1,056,128 held in trust at Ottawa. "This asset, together with some of doubtful value, would make the net debt of the province to the end of the fiscal year \$2,713,301." The Dominion supplementary estimates in April gave \$443,400 to improvements upon the Intercolonial Railway, which is so intimately associated with Nova Scotia affairs. Afterward the province received an award upon its claims regarding the Eastern Extension Railway from the Dominion Government, and the Premier said this sum of \$671,000 would be placed to the credit of the public debt account.

On April 1 the Premier and Provincial Treasurer submitted the estimates of receipts and expenditures for the year ending Sept. 30, 1901. He expected to receive \$1,034,906 from all sources. The principal expenditures which he proposed included \$35,500 on agriculture, \$258,000 on educa-

tion, \$15,000 on Crown lands, \$50,000 on Legislature expenses, \$17,450 on public works, \$25,000 on mines, \$132,100 on charities, \$15,000 on printing, \$50,247 on steamboats, packets, and ferries, \$20,600 on salaries, \$216,405 on road grants, \$148,171 for the payment of debenture interest, \$10,966 for the sinking-fund, \$9,000 for the Miners' Relief fund, and \$11,000 for the refund of succession duties on certain charitable, religious, and educational bequests. Upon bridges, \$220,000 was to be spent out of the capital account.

Eastern Extension Railway Award.—In 1876 the Government of Mr. P. C. Hill, in Nova Scotia, entered into a contract with the Halifax and Cape Breton Railway and Coal Company for the construction of a piece of railway extending from New Glasgow to the Strait of Canso, and undertook to pay, and did pay, a subsidy of \$671,836 for the work done. It was also arranged in the contract that the provincial Government could acquire the road at any time on payment to the company of the amount they had paid out over and above the subsidy received from the Government. In the succeeding year the Dominion Parliament authorized the transfer of the Truro and Pictou branch of the Intercolonial Railway to the person or company constructing a line of railway from New Glasgow to the Strait of Canso. This was duly done, and on April 4, 1880, an agreement was made between the provincial Government and the company by which the former should be at liberty within two years from Nov. 4, 1880, to take over all the railways and property of the company, including the Pictou branch, on paying the actual outlay of the company, exclusive of federal and provincial subsidies. Finally, possession was taken of what was known as the Eastern Extension Railway, the sum of \$1,200,000 was paid over, and a dividend presented to the Federal Government for the transfer of the Pictou branch upon which the profitable operation of the entire road depended. By a federal order in Council of Oct. 20, 1883, two conditions were imposed upon this transfer—one the maintenance of existing through rates, and the other an expenditure of \$800,000 by the province upon rolling-stock. These conditions, the provincial Government declared, were too onerous, the transfer was not accepted, the entire road was ceded to the Dominion authorities, and repayment of the original subsidy of \$671,000 demanded. By correspondence and joint resolution of the two houses at Halifax the claim was pressed, but without success until Sir Wilfrid Laurier's Government took up the matter and appointed a board of arbitration. The decision was:

"1. That the Dominion Government was legally bound to hand over to the province of Nova Scotia the Pictou branch immediately upon the completion of the purchase by the province from the company.

"2. That the conditions imposed by the Dominion Government were illegal and unreasonable, as the Dominion had no right, under the agreement which existed between the two governments and the company, to exact any such condition as to rolling-stock or the tariff; that the quantity of rolling-stock demanded was unnecessary and unreasonable for the efficient working of the road, and that the tariff sought to be imposed was one under which the road could not be operated except at a loss.

"3. That the object of the Dominion Government in imposing said conditions was to make it impossible for the province to take over the road, as the Dominion had decided that it would

not give up the Pictou branch for the reason stated by Sir Charles Tupper in the Dominion Parliament."

Road Grants and the Municipal Councils.—This was a widely discussed subject in the Nova Scotia Assembly, on Feb. 15, the Premier took the opportunity to state his opinion on the subject. He contented himself with the ground that the grants were now made to the representatives of the people, were the channel through which the money could be expended." Mr. C. E. Tanner took issue with Mr. Murray upon this point. "Instead of that, they were carrying out a system which resulted in a division of authority and the frittering away of public moneys. The municipal councils were spending a little money on a road, and a road commissioner was spending a little more money on the same road under a communication issued probably a few days before an election."

The Halifax and Yarmouth Railway.—The members of the Halifax Board of Trade, the mayor and city council of Halifax, and a number of prominent citizens waited on the Premier and his Government, on March 15, to urge the construction of a railway from Halifax to Yarmouth. The Premier replied that the Government had decided to take vigorous action in the matter, and intimated that the wish of the deputation would probably be granted. A few days later a measure was introduced into the Assembly. This bill became law, and on Sept. 1 it was announced that a contract had been signed with Messrs. Mackenzie & Mann, of Toronto, for the construction of the railway from Halifax to Barrington, with a branch from New Germany to Caledonia Corner, a total distance of about 200 miles. Including the provincial arrangement as already outlined, and the Dominion subsidy of \$3,200 a mile, and twice that sum under certain conditions which would no doubt be met, they were to receive \$19,900 a mile, or about \$3,980,000 of a total subsidy. The name announced by the contractors was the Halifax and Southwestern Railway Company. The railway is to be completed by Dec. 31, 1903, and at the end of forty years the amount lent by the Government is to be repaid in full.

Proposed Abolition of the Legislative Council.—The abolition of the Legislative Council has long been a debated question, and many of the existing members were pledged upon appointment to vote for this policy. At the opening of the Legislature, on Feb. 15, Mr. C. S. Wilcox declared that the Government was bound to carry out its oft-stated policy in this connection and demand from the Liberal members of the upper house the redemption of their promises. There were now 19 members in the Council, of whom 16 were pledged to the Government to vote for abolition. This reform had been dangled before the people for twenty years, and yet \$14,000 a year was still being spent to maintain the upper house. Ontario, Manitoba, and New Brunswick were able to conduct their business without this second chamber, and he wished to know why Nova Scotia could not do so, and why this delay was permitted. The Premier replied that the Government policy was the same as ten years ago. "They were in favor of abolition." The reasons, however, had always been financial, and with the existing surplus and prosperous condition they did not operate with the same force. "As a member of the Government, he was not quite clear as to whether the abolition of the Council would be a good thing for the province. He did not think it was doing any harm, but assisted in

passing good legislation." If those who had pledged themselves in the matter had changed their views, they should resign. In the Legislative Council, on March 29, the Hon. W. T. Pipes introduced a bill for the abolition of the Council. His reasons could only be given on the second reading, in accordance with the custom of the house. The president, the Hon. Mr. Boak, received the bill and at once ruled it out of order as opposed to the privileges and rules of the Council. Under decisions of the house adopted on Jan. 29, 1894, and confirmed on Feb. 23, 1897, the measure could not be proceeded with. The president pointed out that in January, 1894, the opinion of three eminent legal gentlemen—Messrs. R. L. Borden, Benjamin Russell, and C. W. Weldon—had been asked as to the status of the pledges given by members of the Council. The answer presented to the house was: "We are clearly of opinion that the giving and the taking of a pledge by which a member of the Legislative Council becomes bound to the political leader for the time being to vote for or against a particular measure is a wholly unconstitutional measure." The committee to which this opinion was submitted reported to the Council on Jan. 26 that they "consider it impossible, so long as such pledges exist or are relied upon by the Government, to obtain the independent judgment of this house upon the question." Mr. Pipes opposed the ruling of the chairman, and moved that it be not sustained. The vote sustained the chairman, 15 to 2, and the measure failed.

Fisheries.—Early in the session the Premier moved a committee of inquiry into fishery conditions, and it was accepted by the house. The report of this committee was presented to the Assembly on April 1 by Mr. Sinclair, as chairman. Meetings had been held and witnesses examined, and they had found that, in proportion as the railway rates to Montreal had been decreased, the trade in fresh fish had increased; that the success at Canso was especially due to this fact, coupled with the establishment of steam communication with railway points; that statistics of the aggregate volume of the fresh-fish trade in the province were unobtainable, but that wherever facilities were provided the progress had been satisfactory; that the advantages to the fishermen in price and in other respects of the fresh-fish trade to that of salt fish were very marked; that the waters of the province contained a practically inexhaustible supply of fresh fish second to none in the world; that, with the exception of live lobsters and a few special varieties, the existing market for fresh fish was chiefly in western Canada, where there was, however, the compilation of the fresh-water fish and the sea-water fish from more favorably situated points on the marine coast. The committee pointed out that the Canadian duty on fish was one half a cent a pound and the American duty one cent a pound. This apparently induced Nova Scotians frequently to buy their schooners in the United States, register them in American waters, and ship American fish to Canada. Under the American registration system the rate of tonnage is less.

The value of the American fish imported into Canada in 1900 was stated at \$661,805. The failure to hold the market was due to adverse duty and the lack of transportation facilities. The committee recommended that the same regulations be applied to the railway transportation of fish that had been adopted by the Department of Agriculture in connection with the shipment of butter and cheese to Montreal. The latest

official figures of the Nova Scotian fisheries available are those of 1899, and they show a production of salmon, \$94,611; mackerel, \$644,864; herring, \$373,401; cod, \$2,530,600; haddock, \$567,766; lobsters, \$1,639,790; hake, \$469,477; pollock, \$197,006; halibut, \$147,316; and miscellaneous, \$682,803. The amount of federal bounty paid to the fishermen of Nova Scotia was \$106,599. The number in receipt of this bounty was 519, the tonnage was 22,538, and the fishermen numbered 5,323. The number of boats in receipt of bounty was 7,235, and the men engaged in them 11,305.

Mines.—On March 5 the Premier made a long reference in the house to the increased sales of coal and the progress of Cape Breton iron and steel industries. To the coal-mines of the province a greatly enlarged market had been given by the development of the Whitney interests. In 1893 the sales of coal to the United States were 16,099 tons, in 1900 they were 624,273 tons. There was steady progress in the mines of Pictou and Cumberland. In the former the production for the year ending Sept. 30, 1900, was 538,884 tons, against 460,236 tons in the preceding year. In the latter the production was 496,804, compared with 437,121 tons in 1899. The Inverness coal-fields were just beginning development, and a well-constructed railway had been run through their centers of production.

The production of gold in the year showed a slight increase—30,999 ounces, against 27,772 ounces in 1899. The milling capacity of the province had been increased by more than 300 stamps.

Eight days after Mr. Murray's speech the report of the Hon. Charles E. Church, Commissioner of Mines, was presented to the house. The total production of coal for the year ending Sept. 30 was 3,238,245 tons, compared with 2,642,333 tons in 1899. The shipment to other countries amounted to only 1,215 tons.

Besides gold and coal, 15,597 tons of iron ore were produced in Nova Scotia in the year, 8 tons of manganese ore, 62,000 tons of coke, 122,281 tons of gypsum, 56,500 tons of grindstones, 50,000 tons of limestone, 783 tons of barytes, 1,100 tons of tripoli and silica, and 600 tons of copper ore.

Agriculture.—The annual report of the Department of Agriculture was presented to the house on March 15 by the Hon. Mr. Murray. He described the progress of this industry as having been very marked, and by way of illustration instanced the growth of agricultural societies. In 1864 there were 37 in the province, with 3,744 members, who subscribed \$1,859, and a Government subscription of \$3,010. In 1894 the number was 80, with 3,986 members and subscriptions reaching \$4,424 from members and \$8,000 from the Government. At the close of 1900 there were 131 societies, with 7,362 members, whose subscriptions amounted to \$9,322. The Government grant was \$10,000. These societies devoted themselves chiefly to the improvement of live-stock. Although they had not all reported, it was clear that 1,200 farmers sent milk to the creameries and cheese factories, and 182 tons of cheese were made by those actually reporting their work.

A week later Mr. Murray proposed the second reading of his bill for the establishment of an agricultural and horticultural school. It was done by agreement with the governments of New Brunswick and Prince Edward Island, and empowered the expenditure of \$50,000 for buildings and farm lands. As it was to be located in their province, the capital expenditure was to be borne by Nova Scotia. The annual expenditure was to be based upon the population of the different

provinces, and was limited to \$10,000. The bill passed in due course. An act was also proposed by the Premier and duly carried for the further encouragement of dairying. An annual appropriation of \$7,000 was provided for establishing schools where special instruction in this subject could be given and for equipping any new creamery that would undertake to manufacture annually for five years not less than 20,000 pounds of cheese.

Education.—The annual report of the Superintendent of Education, Dr. A. H. Mackay, was presented to the Assembly on March 12. The number of schools had increased from 2,390 to 2,417 in the year ending July 31, 1900; the number of school sections without schools had decreased from 146 to 132; the teachers had grown from 2,400 in number to 2,557; the number of

pupils had slightly diminished from 190,617 to 190,129. Those under fifteen years of age, however, had increased from 91,867 in 1899 to 93,043 in 1900; that age the decrease was stated to be probably due to the demands of industrial institutions. The number of normal-school trained teachers had increased from 840 to 887. The amount of ratepayers for schools increased from \$1,100,000 in 1889 to \$510,620 in 1900. The age limit of new teachers in classes D C and B had been advanced one year. The pupils in the common schools numbered 92,880, against 93,043 in 1899; and in the high schools 7,249, compared with 7,574. The total cost per pupil enrolled was \$8.86 in 1900, an increase of 17 cents. The cost per pupil to the Government was \$2.48; to the counties, \$1.19; and to the sections, \$5.18.

O

OBITUARIES, AMERICAN. Abbott,

Frank Wayland, oculist, born in Sandoway, Aracan, Burma, Dec. 24, 1841; died in Buffalo, N. Y., April 9, 1901. He was the son of a Baptist missionary, Elisha L. Abbott, and at the age of three was taken to Fulton, N. Y., where he spent his boyhood. He was graduated at Rochester University in 1863, and at Buffalo Medical College in 1867. During the last year of the civil war he acted as an assistant surgeon in the hospitals at Nashville and Chattanooga. He afterward took a post-graduate course in ophthalmology and otology in the New York College of Physicians and Surgeons, and studied in the eye and ear infirmaries of Brooklyn and New York city. In 1869 he settled in Buffalo. He was a member of the staff of the Buffalo General Hospital and the first eye and ear specialist appointed to it. He was also one of the organizers of the Charity Eye, Ear, and Throat Hospital of Erie County, and he assisted in establishing the training-school for nurses at the General Hospital. He was a member of the Erie County and Buffalo City Medical Societies, and of other organizations, and was well known throughout the country for his many charities.

Adams, Herbert Baxter, educator, born in Shutesbury, Mass., April 16, 1850; died in Amherst, Mass., July 30, 1901. He was graduated at Amherst in 1872. The year following he was instructor in Latin and Greek in Williston Seminary, and the following three years he spent in study in Europe, receiving the degree of Ph. D. from Heidelberg University in 1876. From 1876 to 1878 he was a fellow in history at Johns Hopkins University, and he was connected with that institution as Associate Professor and Professor of History from the latter date till his death. He was lecturer in history at Smith College from 1878 to 1881; member and secretary of the American Historical Association, and editor of its reports after 1884; and a trustee of Amherst College and of the Boys' Country School, Baltimore. After 1887 he was editor of the Contributions to American Educational History for the United States Bureau of Education. He was editor of the Johns Hopkins University Studies in Historical and Political Science, which under his direction completed 19 series, with many additional volumes. He was the author of the Life and Writings of Jared Sparks, and of numerous educational and historical monographs.

Aldrich, Louis, actor, born in Cleveland, Ohio, Oct. 1, 1843; died in Kennebunkport, Me., June

17, 1901. His name was Lyon, but early in his career he adopted the name of Aldrich, and later had that name legalized. When he was ten years old he was thrown upon his own resources, and elected to earn his living on the stage. In school he had been noted among his fellows as a declaimer. A benefit performance to Mrs. John Ellsler was being arranged at the Cleveland Theater, and the boy, then about eleven years old, begged John Ellsler to allow him to appear in it. After a single test, Mr. Ellsler let him appear as Richard III in two acts of that tragedy. So extraordinary was his acting that the management engaged him to play the entire tragedy, and billed him as "the Ohio Roscius." He repeated his first success and was immediately taken on the road through the West as a boy star. The lad was first known as Master Moses. Later, when he was starred by Minnie McCarthy, he was called Master McCarthy. Shortly after that he was placed under the guardianship of Thomas Kean, and was billed as Master Kean. Under these names he starred during 1855-'57 in the rôles of Richard III, Macbeth, Shylock, Claude Melnotte, Young Norval, Selim in Barbarossa, and Jack Shepard. In the spring of 1857 he was obliged to leave the stage, as his voice was changing. He took a course of one year at White Water College, Indiana. In 1858 he returned to the stage and used for the first time the name of Aldrich. He appeared with the Marsh Company, which consisted of 25 girls and 4 boys, in St. Louis, and traveled with them five years. The Marsh troupe disbanded in San Francisco in 1863, and Mr. Aldrich became a member of the stock company at Tom Maguire's Opera-House. In 1866 he appeared at the Boston Theater as Nathan in Leah the Forsaken, in support of Kate Bateman, and afterward in New York, at the Academy of Music, as Coitier in Louis XI, in support of Charles Kean. He returned to Boston for seven seasons, and in 1873-'74 was leading man of Mrs. John Drew's company at the Arch Street Theater, in Philadelphia; made a short starring tour in 1874; and was then engaged for forty-six weeks at Wood's Museum (now Daly's Theater). In 1875 and 1876 he was with John Ford in Baltimore, and then he starred as Marc Antony in Julius Caesar. His starring tour was closed in order that he might play the rôle of Salamenes in the grand production of Sardanapalus at Booth's Theater. The play had a successful run in the season of 1876-'77, and Mr. Aldrich won fresh honors. In the play of The Danites the part of

the Parson was very short, but permission was given to Mr. Aldrich to elaborate it, and this he did with marked success. The play was produced on Aug. 22, 1877, and in twenty weeks the net profits amounted to nearly \$30,000. In the season of 1878-79 he played another term of forty weeks in *The Danites*. *My Partner*, written for him by Bartley Campbell, was produced at the Union Square Theater on Sept. 16, 1879, with Mr. Aldrich in the rôle of Joe Saunders. He played it six years steadily, and after that at intervals. The piece was presented in every State of the Union except Arkansas and Texas. After paying Mr. Campbell \$12,000 in royalties, he purchased for \$3,000 the entire author's rights. Mr. Aldrich made an independent fortune with *My Partner*, and then, wishing to rest, he leased the play for two years. In 1887 he and Frank W. Sanger purchased the Western rights to *In his Power* and produced it in San Francisco, but it was a failure, as was also *The Kafir Diamond*. In May, 1890, Mr. Aldrich produced at Palmer's Theater *The Editor*, the joint work of Charles T. Vincent and himself. While playing in Syracuse his company was in the disastrous fire at the Leland Hotel, and Mr. Aldrich sustained serious injuries. After his recovery he played in *The Senator* and in *Surrender*. His last public appearance was in the revival of *Her Atonement*, New York, 1899. In private life Mr. Aldrich devoted the greater part of his time and money to charities among actors. The amount of his gifts was very large, and his work with the Actors' Fund of New York stands as a monument to his broad philanthropy and untiring energy. He was one of the earliest members of the organization, and its president from June, 1897, till June, 1901. With him originated the idea of the home for aged and indigent actors, and it was largely through his efforts that the home fund was procured and building operations begun.

Alexander, Robert, clergyman and editor, born in Belmont County, Ohio, in 1837; died in Philadelphia, Pa., Feb. 27, 1901. He was graduated at Washington College, Washington, Pa., in 1855, and afterward studied theology at Princeton and at Edinburgh. His first charge was at Little Britain, Pa. In 1867 he accepted a call to the First Presbyterian Church, St. Clairsville, Ohio, and was pastor of that church for thirty-two years. Dr. Alexander assumed the editorship of *The Presbyterian*, Philadelphia, in 1899. He was greatly interested in the educational work of the Presbyterian Church, and was for many years a trustee of Washington and Jefferson College and a director of the Western Theological Seminary in Allegheny, Pa.

Allibone, Charles Olden, naval officer, born in Philadelphia, Pa., Sept. 2, 1846; died at Cavité, Luzon, Philippine Islands, April 18, 1901. He was appointed to the Naval Academy from New Jersey, and was graduated in September, 1867. He was appointed ensign Dec. 18, 1868; master, March 21, 1870; and lieutenant, Nov. 2, 1871. Until 1870 he was on the Asiatic station. In 1881 he was assigned to the Lancaster on the European station, and the following year to the Galena on the South Atlantic station. He was promoted to be lieutenant-commander in 1892, served as assistant inspector of the Columbia, and July 3, 1898, received his commission as commander. In the same year he was assigned to duty as lighthouse inspector and served in that capacity till July 1, 1899, when he was placed in command of the gunboat *Wilmington*. His ship was doing duty in the Asiatic squadron at the time of his death.

Anderson, Andrew Mathen, soldier, born in Delaware, Ohio, April 21, 1841; died in Sandusky, Ohio, April 18, 1901. At the outbreak of the civil war he enlisted as a private in the 4th Ohio Volunteers, and he served throughout the war, rising to the rank of captain. He was appointed adjutant of the Ohio Soldiers' Home in Sandusky when it was organized in 1888, and served in that capacity till the death of Gen. Manning F. Force, in 1899, when he succeeded him as commandant.

Archer, Frederic, organist, born in Oxford, England, June 16, 1838; died in Pittsburg, Pa., Oct. 22, 1901. He began his studies under his father in Oxford, and later studied in Leipsic, and in 1852 was made organist of St. Clement's Church and Merton College Chapel. Continuing his studies, he later became organist of the Royal Panopticon, London, and in 1863, with Sir Julius Benedict, conductor of the London Vocal Association. In 1865 he was made organist and choir-master of Christ Church, Lancaster Gate, London; later he served in the same capacity in the church of the Jesuit fathers, leaving this place in 1873 to become organist and orchestral and choral director in Alexandra Palace. In 1879 he was made musical examiner in Glasgow University and conductor of the Glasgow Select Choir, and in 1880 he removed to the United States to accept the organ in Plymouth Church, Brooklyn, N. Y. He afterward served as organist in the Church of the Incarnation, New York city. In 1885 he founded *The Keynote*, of which he was the editor. In 1887 he was chosen conductor of the Boston Oratorio Society and director to the club. In 1895 he became city organist and director of the Carnegie Music Hall, Pittsburg, Pa. He founded the Pittsburg Symphony Orchestra in 1896 and was its conductor till 1898. In addition to his duties at Music Hall he was musical examiner for the University of Toronto after May, 1898; organist and choir-master of the Church of the Ascension, Pittsburg, after January, 1899; and he gave many recitals and concerts, and delivered lectures on musical subjects in Canada and the United States. He was author of an organ school, and he composed considerable music for the organ and the pianoforte.

Archer, Robert S., iron merchant, died in Richmond, Va., March 30, 1901. He was a member of the firm of Joseph R. Anderson & Co., in Richmond, before their plant became the property of the Tredegar Company, and during the civil war, when the Tredegar works were the mainstay of the Confederate Government in the manufacture of heavy ordnance, he was superintendent, with the rank of major. He remained superintendent of the Tredegar works till his death, was president of the Southern Railway Supply Company, and was well known throughout the country in the iron trade.

Armour, Herman Ossian, packer, born in Stockbridge, N. Y., March 7, 1837; died in Saratoga, N. Y., Sept. 8, 1901. In 1855 he went to Milwaukee, Wis., where he engaged in business, and where he afterward became a member of the firm of Armour, Plankinton & Co., which was grown from a small butcher shop into the largest pork-packing business in the world. In 1862 he removed to Chicago and established there the grain commission business that was later known as H. O. Armour and Company. After 1865 he represented the Armour interests in New York.

Armour, Philip Danforth, capitalist, born in Stockbridge, N. Y., May 16, 1832; died in Chicago, Ill., Jan. 6, 1901. He was brought up on his father's farm, and was educated in the district school and at Cazenovia Academy. As soon as he

could be spared from the farm he left for the newly discovered gold-fields of California. Not having the money to go by ship, he set out with

a party of 30 persons from Oneida, N. Y., in the spring of 1852, traveling overland, much of the way on foot. He was successful after reaching California, making several thousand dollars by developing ditches to supply water for placer-mining. He returned home in 1856, but soon afterward went to Milwaukee, where he engaged in the wholesale grocery and commission business with an old

friend, Frederick S. Miles. In 1863 the partnership was dissolved and Mr. Armour associated himself with John Plankington, the pioneer pork-packer. In 1862 his brothers—Herman O. Armour and Joseph F. Armour—had started a grain commission house in Chicago. Philip Armour foresaw that Chicago was to be the center of the packing trade, and he persuaded his brothers to take it up. Later a partnership was formed under the trade name of Armour & Co., the Chicago grain commission business being continued under the name of H. O. Armour & Co. Philip D. Armour's capital had increased to \$2,000,000 at the time of the civil war. In the winter of 1864-'65 pork was selling at \$40 a barrel, with an upward tendency. Although an immense trade in pork was then done in Chicago, New York was the real center of the business, and most of the packers and operators were buying liberally for future use, being firm believers in the continuance of high prices. Mr. Armour saw that the war was nearing its end, and that when the Confederacy fell pork prices would fall with it. One day the New York operators were amazed at a young man from Milwaukee who came among them and offered all the pork they would take at \$40 a barrel. They were amazed still more when there was a sudden break and the price went down to \$30. But even at that price Armour kept on selling. Soon Petersburg fell and Richmond was evacuated. Then pork collapsed. Mr. Armour began to deliver the goods he had sold at \$30 to \$40 at \$18. There was a panic among the bulls, and some of them tried to repudiate their contracts. Even Mr. Armour's brokers turned against him, but he pressed his debtors and forced them to settle. In this deal he is said to have netted more than \$2,000,000. After the war the Armour business grew enormously. In 1875 Mr. Armour removed to Chicago, where he remained in charge of the great central plant. A remarkable feature of the growth of the business is the manner in which all the Armour brothers worked together. One of the six, Charles Eugene, enlisted in the Union army and died in a Union hospital in 1863. The other five were, sooner or later, all engaged in the firm. In recent years the annual business of the firm has exceeded \$100,000,000, and more than 11,000 persons are in its employ. While Mr. Armour's name was more generally associated with his packing establishment, he was actively interested in many other enterprises. As the owner of an important system of grain-elevators, and as a heavy investor in the grain products of the Middle and Western States, he was an important factor in the grain markets. Among Mr. Armour's

numerous charities the most notable is the Armour Mission, the Armour Educational and Armour Institute, all in Chicago. The mission was established by a bequest of \$100,000 by Philip Armour, more than doubled by Philip, his executor. The Armour Flats comprise 213 apartments, which are rented at moderate prices to working men and their families. They adjoin the mission, and the net proceeds go to its support. The mission flats are said to be worth \$3,000,000. The Armour Institute was established at an original cost of \$1,500,000, to which sum Mr. Armour added \$750,000 in 1899. It offers business and technological courses, and has a fine gymnasium and library. It was opened in September, 1893, with 600 pupils.

Arnold, Abraham Kerns, soldier, born in Bedford, Pa., March 24, 1837; died in Cold-Spring-on-Hudson, N. Y., Nov. 23, 1901. He was graduated at West Point in 1859 as brevet 2d lieutenant, 2d United States Cavalry. He was promoted 2d lieutenant, June 28, 1860; 1st lieutenant, April 6, 1861; and regimental adjutant, June 1, 1861. The designation of the regiment was changed to 5th Cavalry, Aug. 3, 1861, and in it he became captain, July 17, 1862. His later promotions were major, 6th Cavalry, June 22, 1869; lieutenant-colonel, 1st Cavalry, June 11, 1886; colonel, 8th Cavalry, Feb. 7, 1891, and he was transferred to the 1st Cavalry, April 22, 1891. He received brevets of major, June 27, 1862, "for gallant and meritorious services at the battle of Gaines's Mill," and lieutenant-colonel, May 6, 1864, "for gallant and meritorious services at the battle of Todd's Tavern," and was awarded a medal of honor for conspicuous gallantry in a charge on the enemy in action at the Davenport bridge, North Anna river, May 18, 1864, while captain, 5th United States Cavalry, commanding the regiment. After graduation he served at the cavalry school at Carlisle Barracks, till October, 1860, when he conducted a detachment of recruits from New York to Fort Inge, Texas, where he joined his troop, Dec. 2, 1860. In February, 1861, he conducted the last scout against Indians in Texas, before the State seceded, and he reached the seacoast and embarked for New York in April without being made a prisoner. His regiment was re-equipped at Carlisle, Pa., and its designation changed to 5th United States Cavalry. With it he participated in Patterson's campaign in the Shenandoah valley and was engaged at Falling Waters, July 4, 1861. He served in the defenses of Washington, August, 1861, to March, 1862, when he joined the Army of the Potomac and took part in the Peninsula campaign, and was severely wounded at Gaines's Mill. In September, 1863, he joined the 5th United States Cavalry and commanded it at Bristoe Station and Rixleyville, October, 1863. He took part in the raid to Charlottesville, February, 1864; combat at Todd's Tavern, May 7, 1864; Sheridan's raid to Haxall's Landing, and actions at the crossing of the South Anna river, and Beaver Dam, May 10, 1864; and battle of Yellow Tavern, May 11, 1864. The regiment was with Sheridan on his raid to Gordonsville, and in the battle of Trevillian Station, June 11 and 12, 1864. Major Arnold was detailed as instructor of cavalry tactics at West Point, Aug. 24, 1864, and continued on this duty until Aug. 28, 1869, when he joined the 6th United States Cavalry in Texas. During the following twenty-nine years he served mostly with his regiment in Texas, Kansas, Arizona, and New Mexico, taking part in many Indian campaigns and receiving high commendation. Soon after the breaking out of the Spanish War, May 4, 1898, he was made brigadier-general.

dier-general of volunteers, and he served as such until honorably discharged, May 12, 1899. He was in command of the cavalry division at Chickamauga Park, Ga., from April 25, 1898, to May 17, 1898, when he was assigned to command the 2d Division, 1st Army Corps; commanding cavalry division at Tampa, Fla., May 20, 1898; commanding 2d Division, 7th Army Corps, May 28, 1898, till Oct. 29, 1898, and temporarily in command of 7th Army Corps; commanding cavalry brigade, Oct. 30, 1898, to Jan 10, 1899, and temporarily in command of 4th Army Corps; ordered to Cuba, and was in command of the 2d Division, 7th Army Corps, Jan. 16, 1899, to April 1, 1899. He was retired from active service March 4, 1901.

Babcock, Maltbie Davenport, clergyman, born in Syracuse, N. Y., Aug. 3, 1858; died in Naples, Italy, May 18, 1901. He was graduated at Syracuse University in 1879, entered Auburn Theological Seminary, and was graduated there in 1882. In January of the senior year in Auburn he was called to the First Presbyterian Church in Lockport, N. Y. He served as its pastor till October, 1887, when he accepted the call of the Brown Memorial Presbyterian Church in Baltimore, Md. As its pastor he was eminently successful, winning a place for himself in the hearts of people of all creeds and in all walks of life and society. Every effort was made by the citizens of Baltimore to retain him when in 1899 he was called to the Brick Presbyterian Church in New York city. He began his duties there in January, 1900. In February, 1901, he sailed with a party of friends to visit Italy, Egypt, Palestine, Syria, and Constantinople. He was taken ill with Mediterranean fever on the steamer on the way from Constantinople to Brindisi, and after an illness of a week died in the International Hospital, in Naples. A volume of poems and selections from his prose writings and sermons, *Thoughts for Every-Day Living*, was edited by his wife and published in 1901.

Bacon, Charles A., educator and astronomer, born in Brattleboro, Vt., in 1860; died in Beloit, Wis., Nov. 6, 1901. He was graduated at Dartmouth College in 1883. During 1883 and 1884 he was instructor in science and mathematics in Hallowell Classical Academy, and in 1884-'85 instructor in science in Wakefield, Mass. In 1885 he went to Beloit College to assume charge of the new Smith Observatory, wherein he spent several years in study and observation. He was a brilliant mathematician and astronomer, and attained a world-wide reputation through his discussions of meteoric showers, sun-spots, and eclipses. He had been physically helpless for six years, but continued to teach his classes till his death.

Ballard, Charles Henry, inventor, born in Leominster, Mass., June 9, 1822; died in Worcester, Mass., Aug. 9, 1901. As a boy he showed great liking for everything connected with machinery, and his ingenuity was the wonder of his native village. When he was about fifteen years old he made a desk out of an old walnut table, which he bound with brass that he was allowed to work at the village blacksmith shop. In this desk he constructed a secret drawer opened by a hidden spring. Over this drawer experts worked after his death, but failed to find either the drawer or the manner of opening it. At the outbreak of the civil war he had for some time been foreman in the factory of Ball & Williams in Worcester. In 1860 he obtained patents on a breech-loading rifle. It was of 42 caliber and was especially adapted to cavalry use, and it was used exten-

sively during the war. In 1862 Ball & Williams employed 200 men in turning out this arm. In the latter part of his life Mr. Ballard engaged in the manufacture of hand-vices. Though he retired from active life several years before his death, he retained the reputation of being one of the finest workmen in his trade, and he never lost interest in invention, leaving many patterns unfinished at his death.

Ballard, Stephen, philanthropist, born in Andover, Mass., Sept. 9, 1815; died in Brooklyn, N. Y., Aug. 11, 1901. He began business as a lumber-merchant, and for many years he was agent for the Amoskeag Manufacturing Company in Manchester, N. H. After 1858 he was engaged in the belting business in New York city, and in 1897 he retired. He was treasurer of the White, Potter, Page Manufacturing Company till his death. He founded the Ballard School for Colored Persons in Macon, Ga., and for the last fifteen years of his life was its chief support. He also gave liberally to the Afro-American schools at Livingston College, Salisbury, N. C., Tougaloo, Miss., and Berea, Ky. He was one of the earliest members of the Central Congregational Church of Brooklyn, and was one of its trustees. He rendered aid to other denominational churches, and gave two apartment-houses to be used in connection with the work of the Young Men's Christian Association.

Bancroft, Cecil Franklin Patch, educator, born in New Ipswich, N. H., Nov. 25, 1839; died in Andover, Mass., Oct. 4, 1901. He was graduated at Dartmouth College in 1860, and at Andover Theological Seminary in 1867, having served from 1860 to 1864 as principal of an academy in Mount Vernon, N. H. He studied at the University of Halle, Germany, and late in 1867 became principal of Lookout Mountain educational institutions in Tennessee, where he remained till 1872. He was ordained in the Congregational ministry May 1, 1867, but he never became a pastor. In 1873 he became principal of Phillips Academy, Andover, Mass., in which capacity he served till his death. Dr. Bancroft received the degree of Ph. D. from the University of the State of New York in 1874, that of Litt. D. from Williams College in 1891, and that of LL. D. from Yale in 1892. He was a trustee of Andover Theological Seminary, and after 1897 of Dartmouth, and was active in many other educational, religious, and charitable institutions. He gave many addresses and wrote much for the periodical press on religious and educational subjects.

Barker, William Morris, clergyman, born in Towanda, Pa., May 12, 1854; died in Tacoma, Wash., Feb. 21, 1901. He studied at the University of Pennsylvania and at the Berkeley Divinity School in Middletown, Conn., and was admitted to deacon's orders in the Protestant Episcopal Church in 1879 and to the priesthood in 1880. After serving as an assistant for a year and a half in churches in Troy, N. Y., and Washington city, he was for six years rector of St. Paul's Church in the latter city. He was successively rector of St. Luke's Church, Baltimore, Md., and St. Paul's Church, Duluth, Minn., and on Jan. 25, 1893, he was consecrated bishop of the newly established missionary diocese of Western Colorado. In 1894 Bishop Barker was translated to the missionary diocese of Olympia, comprising the western half of the State of Washington.

Bartlett, Charles G., soldier, born in West Point, N. Y., in 1839; died in New York city, June 14, 1901. He was a son of the late Prof. William H. Bartlett, of West Point. On April 17, 1861, he was appointed a sergeant in the 7th Regi-

ment of the National Guard. He was honorably discharged on May 8 of the same year, and accepted a commission as captain in the 5th Regiment, New York Volunteers. He was mustered out, Sept. 8, 1861, having been appointed captain in the 12th Regular Infantry. He served with this regiment until appointed lieutenant-colonel of the 150th New York Volunteers, Sept. 29, 1862. He became colonel of the 119th United States Colored Infantry, May 10, 1865, having been brevetted major (May 14, 1864) and lieutenant-colonel (March 13, 1865) in the regular army for gallant and meritorious service in the battle of Resaca, Ga., and brigadier-general (March 13, 1865) for efficient service throughout the war. In the regular army he was transferred as captain to the 30th Infantry, Sept. 21, 1866, and to the 4th Infantry, March 23, 1869. He was made major of the 11th Infantry, Jan. 10, 1876; lieutenant-colonel of the 1st Infantry, March 10, 1883; and colonel of the 9th Infantry, April 23, 1890. He was retired, at his own request, May 1, 1896. He served as librarian in the district-attorney's office in New York city in 1898-1901. Gen. Bartlett was drowned in the sinking of the Staten Island ferry-boat Northfield in collision with another ferry-boat off her pier at South Ferry.

Batchelder, Richard Napoleon, soldier, born in Meredith (now Lakeport), N. H., July 27, 1832; died in Washington, D. C., Jan. 4, 1901. In early life he showed an uncommon aptitude for business. He was director in a State bank and a trustee of savings-banks, and was largely interested in railroad construction. In politics he was a Republican, and for two years he held the most important financial office in the State, and for two terms served in the Legislature. In April, 1861, he enlisted in the 1st New Hampshire Infantry, and on May 2 he was made lieutenant and quartermaster. In June, 1861, he was appointed quartermaster of the 7th Brigade, Army of the Shenandoah. In March, 1862, he became chief quartermaster, 2d Division of the 2d Corps, and he was present at the battles of Fair Oaks, Savage Station, White Oak Swamp, Glendale, Malvern Hill, Antietam, and Fredericksburg. In August, 1861, he had been made captain of volunteers, and Jan. 1, 1863, lieutenant-colonel and quartermaster of the 2d Corps. While in this corps he took part in the battles of Chancellorsville and Gettysburg, the operations at Mine Run, and the battles of the Wilderness, Spottsylvania, North Anna, and Cold Harbor, and he was especially commended in the reports of Gens. Hancock, Couch, Sedgwick, Meigs, Ingalls, Meade, and Grant. When Gen. Grant assumed the direction of the army in 1864, Batchelder was made chief quartermaster of the Army of the Potomac, then under Meade. He was brevetted, March 13, 1865, major, lieutenant-colonel, colonel, and brigadier-general of volunteers, and major, lieutenant-colonel, and colonel United States army, and at the close of the war he was attached to the regular army as a quartermaster on the request of Grant. His advance in the regular establishment was: Captain, Feb. 16, 1865; major, Jan. 18, 1867; lieutenant-colonel, March 10, 1882. On June 26, 1890, he was appointed brigadier-general and quartermaster-general of the army, and served in that capacity till his retirement, July 27, 1896, on reaching the age limit of active service. During the years that he was quartermaster-general at Washington he effected many improvements in the service. Change of boots and shoes was provided for the privates in the army; the new style of rubber blanket was adopted; a canvas legging for the mounted trooper in the Southwest was put

into use; sanitary methods in the collection and distribution of garbage at army posts were introduced, crematories and sanitary earth-burial provided; the architecture of the new post-houses far superior to any hitherto known in this country; the water-supplies of the different posts replenished; and the national cemeteries beautified and laid out in the proper order.

Belknap, Charles, naval officer, born in Jersey City, N. J., Aug. 25, 1846; died in Baltimore, Md., June 15, 1901. He was appointed to the Naval Academy in 1864, and received his commission as ensign, Dec. 18, 1868. His subsequent advancement was as follows: Master, March 21, 1879; lieutenant, March 21, 1871; lieutenant-commander, Feb. 12, 1889; and commander, Dec. 6, 1896. He was one of the most efficient officers of the navy, and saw much sea service on the old line ships. He was three times instructor in physics and chemistry, and later torpedo instructor in the Naval Academy. He was assigned to the command of the training-ship Dixie, Dec. 4, 1899.

Benedict, Charles L., jurist, born in Newburg, N. Y., March 2, 1824; died in New York city, Jan. 8, 1901. He was graduated at the University of Vermont in 1844, studied law, and became a partner in the firm of Benedict, Burr & Benedict. In 1861 and 1862 he was a Republican member of the New York Assembly, and while in Albany he met and formed a lasting friendship with Gen. Benjamin F. Tracy, with whom he afterward practised law under the firm name of Benedict, Tracy & Benedict. In March, 1865, President Lincoln appointed Mr. Benedict to be judge of the Eastern District of New York. Judge Benedict served for thirty-two years on the bench, resigning in June, 1897. He achieved a high reputation for his decisions in admiralty and for his fairness in criminal cases.

Bergholz, William R., engineer, born in Hanover, Germany, April 14, 1832; died in New Rochelle, N. Y., Jan. 16, 1901. He was graduated at the Polytechnical School in Hanover and at the Royal Academy of Engineers in Munich. At the age of twenty-one he came to America, and lived for a while at the home of the German consul in Montreal. Then he went to Burlington, Vt., and laid out the gardens of Le Grand B. Cannon. When the civil war began Mr. Bergholz was in the South, and he was one of the few engineers familiar with the railroads of the Southern States who were willing to serve with the National troops, and Gen. Sherman put him on his staff with the rank of major. He served with Sherman till the close of the war, and afterward devoted himself chiefly to railroad-building. He laid the Southern Pacific Railroad through Texas, the Alliance and Lake Erie Railroad in Ohio, the Pittsburg and Buffalo Railroad, and several other lines and extensions. One of his greatest achievements in the railroad business was obtaining the right of way from the United States Government for the West Shore Railway to go through West Point. In 1878 Major Bergholz was one of the engineers employed by the Russian Government in dredging the mouth of the Neva. He was interested in many of the lines that he had built, and accumulated a fortune from these interests. In 1870 he laid out the large country property at New Rochelle, known as Highwood, covering hundreds of acres, and abounding in lakes, shrubbery, and rare scenery.

Bishop, Joel Prentiss, author, born in Volney, N. Y., March 10, 1814; died in Cambridge, Mass., Nov. 4, 1901. He was educated at White-stone Seminary, Oneida Institute, and Stockbridge Academy. At the age of twenty he left his

father's farm to carry on his studies, earning the money for tuition and books by teaching. Hard work and study soon broke down his health, and in 1835, having become deeply interested in the slavery question, he accepted the office of general business manager, publishing agent, and assistant treasurer of the New York Antislavery Society, and assistant editor of *The Friend of Man*, an antislavery paper published in Utica. He removed to Boston in 1842, and in 1844 was admitted to the bar. He practised for a time, but the success of his Commentaries on the Law of Marriage and Divorce and Evidence in Matrimonial Suits (1856), influenced him to devote his entire time to the writing of law-books. The honorary degree of Doctor Juris Utriusque was conferred by the University of Bern, Switzerland. He was a trustee of the Social Law Library from 1844 to 1871, and in the early fifties he was tendered the appointment of Chief Justice of the Hawaiian Islands by King Kamehameha III. He never held public office. His other important law treatises are: *Marriage, Divorce, and Separation*; *Commentaries on Criminal Law* (2 vols., 1856-58); *New Criminal Law*; *Criminal Procedure*; *First Book of the Law*; *The Law of Married Women*; *Statutory Crimes*; *Law of Contracts*; *The Written Laws*; *Directions and Forms*; *Non-Contract Law*; *New Criminal Procedure*. He also wrote *Thoughts for the Times*; *The Law of Nolle Prosequi in Criminal Cases*; *Secession and Slavery*; *Strikes and their Related Questions*; and *Common Law and Codification*. He was also an occasional contributor to periodicals.

Blaisdell, Elijah W., politician, born in Montpelier, Vt., in 1826; died in Rockford, Ill., Jan. 14, 1901. In 1853 he settled in Rockford, Ill. He purchased the Rockford Forum, changed its name to *The Republican*, and began an agitation against slavery. He advocated forming a party that should stand against the extension of human bondage. He called a mass meeting of the citizens of his congressional district and offered a resolution that a new party should be formed to be known as "the Republican party," and it was passed without a dissenting voice. Shortly afterward Mr. Blaisdell attended the convention in Springfield and listened to the great antislavery speech of Abraham Lincoln. The trend of the speech led the editor to urge Lincoln for the presidential nomination of the Republican party, then forming.

Blodget, Lorin, statistician and economist, born near Jamestown, N. Y., May 25, 1823; died in Philadelphia, Pa., March 24, 1901. He was educated at Jamestown Academy and at Geneva (now Hobart) College. In November, 1851, he was made an assistant in the Smithsonian Institution. His earliest work was researches in climatology. His papers on atmospheric physics were among the first published in this country, and performed an important part in establishing the science in the United States. From 1852 till 1856, in the employ of the War Department on the Pacific Railway survey, he directed the determination of altitudes and gradients by means of the barometer. In 1863 he took charge of the financial and statistical reports of the Treasury Department, and was connected with that department till his resignation from Government service in 1877. He was appraiser-at-large of customs from 1865 till 1877, and special assistant of the Treasury Department in 1874 and 1875. He was secretary of the Philadelphia Board of Trade from 1858 till 1865; editor of the Philadelphia North American from 1859 till 1864; and four times was in charge of the industrial census of Philadelphia.

His writings, besides editorials, amount to 150 volumes and 350 pamphlets. His *Climatology of the United States*, and of the Temperate Latitudes of the North American Continent (1857) was highly praised by Humboldt, and reached a large circulation both in America and abroad. His *Commercial and Financial Resources of the United States* (1864) sold more than 30,000 copies, was reprinted in Nuremberg, and did much to sustain American credit in Europe.

Bolton, Charles Edward, lecturer and author, born in South Hadley Falls, Mass., May 16, 1841; died in East Cleveland, Ohio, Oct. 23, 1901. After graduation at Amherst College in 1865 he engaged in business in Cleveland, and patented several inventions. He traveled extensively in America and Europe, and took a deep interest in economic problems, to the study of which he devoted much time in his later years, giving talks to the workmen in the various workshops of Cleveland in furtherance of his plans for educational improvement. He founded the Cleveland Educational Bureau, which for several seasons gave educational entertainments to large audiences. He was several times mayor of East Cleveland, a locality which he described in an article in the *Review of Reviews* for November, 1899, under the heading *A Model Village*. He published *Notes from Letters* (1892), *A Few Civic Problems of Greater Cleveland* (1897), and *A Model Village and Other Papers* (1901).

Boutelle, Charles Addison, Congressman, born in Damariscotta, Me., Feb. 9, 1839; died in Waverly, Mass., May 21, 1901. His father was a shipmaster, and after giving his son such education as could be obtained in the public schools of Brunswick and at Yarmouth Academy, allowed him to choose his own profession. Young Boutelle went to sea at the age of fifteen and followed a seafaring life till the close of the civil war. He became a master in 1860, and returning from a foreign cruise in 1862, promptly offered his skill and experience in the naval service of his country. He was commissioned acting master in the navy, and served in the North and South Atlantic squadrons and the West Gulf squadron, taking part, on the gunboat Paul Jones, in the blockade of Charleston and Wilmington, in the Pocotaligo expedition, the capture of St. John's Bluff, and the occupation of Jacksonville, Fla. He was detached June 28, 1863, but returned to duty Aug. 27 of the same year. While an officer of the United States steam gunboat *Sassacus* he was appointed to the grade of acting volunteer lieutenant for gallant conduct in the engagement with the Confederate ironclad *Albemarle* on May 5, 1864. As commander of the United States steamship *Nyanza* he served under Farragut, participating in the battle of Mobile Bay, and receiving the surrender of the Confederate fleet. He was also for a time in command of the naval forces in Mississippi Sound. He was honorably discharged from the service at his own request, Jan. 14, 1866. For a short time he was the captain of a steamer running between New York and Wilmington, and afterward he engaged in the commission business in New York city. In 1870, at the suggestion of James G. Blaine, he was chosen managing editor of the *Bangor Whig and Courier*, Bangor, Me. In May, 1874, he became its proprietor, and remained its owner till his death. His editorial articles at once brought him conspicuously before the community, and he soon became recognized as a factor in the political life not alone of Maine, but of all the Eastern States. He held prominent places in the delegations to the Republican National Conventions of 1876, 1880, 1884,

and 1888. In 1880 he was nominated for Congress, but was defeated by Dr. George W. Ladd, of Bangor, by 855 votes. His opponent had carried the previous election by nearly 3,000 majority, and Mr. Boutelle was encouraged to be a candidate again in 1882. He was elected, and represented the 4th District of Maine continuously from that time till December, 1900, when he resigned his seat, and by special enactment was made (March 1, 1901) a captain on the retired list of the navy in consideration of his services in the civil war. He was the leading Republican on the Committee on Naval Affairs in every Congress from the Forty-eighth to the Fifty-seventh, and five times served as its chairman. He drafted and secured the passage of the measures that secured the construction of the first three modern battle-ships in the new navy, and the swift commerce destroyers Columbia and Minneapolis. He insisted from the first on the thorough Americanization of the navy in all its departments, and secured the provision in all the appropriations that the materials of American ships should be of American manufacture. To this policy and to his faith in the superiority of American ships from American manufactures is largely due the perfection of the steel-armor plants and the building up of the great gun factory in Washington, where the most powerful and efficient ordnance in the world is produced. Mr. Boutelle was a popular and efficient speaker, and took an active part in all questions that came before the House of Representatives. In the Fifty-third Congress he forced the Hawaiian question till the Cleveland administration was forced to show its hand, and in the Fifty-fourth Congress he voted alone against the Venezuelan resolutions and the recognition of Cuba. He voted against hastily rushing into the war with Spain, but at the same time labored to bring the navy into its most efficient condition, and to him largely is due the preparedness with which it finally entered upon the war and the great victories that brought the struggle to its speedy termination.

Bradbury, James Ware, United States Senator, born in Parsonfield, Me., June 10, 1802; died in Augusta, Me., Jan. 6, 1901. He attended the public schools of Parsonfield, Saco, Limerick, and Effingham and Gorham Academy, and then entered the sophomore class of Bowdoin College in 1822 and was graduated third in the famous class of 1825, that included Longfellow and Hawthorne. After graduation he was principal of Hallowell Academy one year, and then studied law. He opened a school in Effingham, N. H., in 1829, for the instruction of teachers, believed by some to have been the first normal school in New England. He began the practise of law in Augusta in 1830, and in 1833 went into partnership with Horatio Bridge, and in 1853 began the association with Gov. Lot M. Morrill that lasted for many years. He was county attorney from 1834 till 1838, and for a time edited the Maine Patriot. In 1844 he attended the National Democratic Convention, and in the same year was president of the electoral college of the State. In 1846 he was elected to the United States Senate, and he served his full term, but declined a renomination. He served as chairman of the Committee on Printing and of a select committee on the French spoliation claims.

Brewerton, George Douglas, soldier and author, born in Rhode Island, about 1820; died in New York city, Jan. 31, 1901. He joined Stephenson's regiment of California Volunteers in 1846 as 2d lieutenant, became 2d lieutenant in the 1st United States Infantry, May 22, 1847, and 1st

lieutenant in June, 1850. In 1852 he resigned. He published *The Automaton Battery* (1862), *The Automaton Company* (1863), and *The Automaton Battery* (1863), devices for the selection of military recruits, which were extensively in connection with the regular books of tactics. He was the author of several other books, including *The War in Kansas: A Rough Ride on the Border among New Homes and a New People* (1856); *Fitzpoodle at Newport* (1861), and *Ida Lewis* (1869).

Brinker, Henry, born in Hanover, Prussia, March 17, 1831; died in Rochester, N. Y., Sept. 15, 1901. He was educated in the common schools of his native country, and in April, 1851, arrived in New York and became clerk in a store. In two years he had saved enough to embark independently in the commission business, and two years later established a ship-building business. He built many boats, among others the steamboat Henry Brinker, that was bought by the United States Government and rendered good service during the civil war. He enlisted in the 3d New York Cavalry in 1855, passed through all the intermediate grades, and served as major-general of the National Guard on Gov. Tilden's staff, and commanded the militia at the Hornellsville strike of 1877. After 1871 he resided in Rochester. He was interested in several railroads, was one of the founders of the Germania Fire Insurance Company of New York, and was a director of the Sun, St. Nicholas, and Amsterdam insurance companies. In all he was president, vice-president, or director of more than forty corporations at his death. Gen. Brinker had visited every country of the world excepting China and Australia. In 1868 he was a guest of Emperor William of Germany, and was for six weeks a special officer on the staff of Gen. von Foltzate.

Brogden, Curtis Hooks, politician, born in Wayne County, N. C., Dec. 6, 1816; died in Goldsborough, N. C., Jan. 5, 1901. His early days were spent on the farm and in attendance at the district school. He studied law and was an active member of the State militia, in which he attained the rank of general. He was presiding judge of the Wayne County court for several years. He was elected to the Legislature in 1838, and served continuously in one house or the other till 1856, when he was elected Comptroller of the State and by successive elections occupied that office from Jan. 1, 1857, till Jan. 1, 1867. He was a Republican presidential elector in 1868, and was appointed collector of internal revenue in 1869, but declined the office. He was again elected State Senator in 1868 and 1870, and in 1872 became Lieutenant-Governor. On the death of Gov. Caldwell, in 1874, he succeeded to the office of Governor, serving till 1877. In 1876 he was elected to Congress as a Republican, and he served from March, 1877, till March, 1879. He was again a member of the Legislature in 1886.

Brown, Charles Henry, physician, born in New York city, June 18, 1856; died there, Oct. 15, 1901. He was graduated at New York University, in the medical department, in 1879, receiving the highest honors in his class. He practised in New York city, and was at different times connected with the New York Dispensary, the Post-Graduate and the Presbyterian Hospitals, and the outdoor work of Bellevue Hospital; and he was a member of the County Medical Society and of the Academy of Medicine. In 1889 he became managing editor, and later owner, of *The Journal of Nervous and Mental Diseases*. By his ability and energy he widened its scope and brought it to a high standard of excellence as the recognized

official organ of the American Neurological Association, and of the New York, the Philadelphia, and the Chicago Neurological Societies.

Bruce, John, jurist, born in Stirlingshire, Scotland, Feb. 16, 1832; died in Waters Park, Pa., Oct. 1, 1901. He was brought to the United States by his parents in 1840, who settled on a farm in Wayne County, Ohio. He was graduated at Franklin College, New Athens, Ohio, in 1854, removed to Iowa, and, being admitted to the bar in 1856, practised in Keokuk till the outbreak of the civil war. He enlisted in the National army, and attained the rank of colonel and was brevetted brigadier-general. After the war he became a cotton-planter in Alabama, and in 1872 he was elected to the State Legislature. He was appointed, Feb. 27, 1875, Federal Judge of the Middle District of Alabama, and served continuously till his death.

Bryant, Montgomery, soldier, born in Fort Leavenworth, Kan., Dec. 28, 1831; died in Wichita, Kan., June 17, 1901. He was a son of Thomas S. Bryant, an assistant surgeon in the United States army, who accompanied the command that established the post at Fort Leavenworth, then in a wilderness. Montgomery Bryant entered the regular army in 1857, receiving his commission as a 2d lieutenant in the 6th Infantry, Feb. 21. He was appointed 1st lieutenant, May 3, 1861; captain, June 10, 1861; and Dec. 13, 1862, was brevetted major for gallant and meritorious services in the battle of Fredericksburg, Va. He received the regular appointment of major of the 14th Infantry, Oct. 7, 1874; and, June 22, 1882, he was made lieutenant-colonel of the 8th Infantry, and, Dec. 16, 1888, colonel of the 13th Infantry. Col. Bryant was in command of the 13th Infantry at Fort Sill, when, at his own request, he was retired, March 1, 1894.

Bryce, Joseph Smith, soldier, born in Georgetown, D. C., in 1808; died in New York city, April 16, 1901. He was graduated at West Point in 1829. Robert E. Lee was at the head of that class, Bryce standing third. He remained at West Point for some time after his graduation, and then resigned from the army and studied law. At the beginning of the civil war Mr. Bryce again entered the army, was commissioned major, and served on the staff of Gen. Wadsworth as adjutant-general. After a year he was transferred to the staff of Gen. Barnard, and while serving under him assisted in the preparation of the defenses of Washington. At the close of the war Major Bryce retired to private life, and after that spent much of his time in travel in the United States and abroad.

Bulloch, James Dunwoody, naval officer, died in Liverpool, England, Jan. 7, 1901, at the age of seventy-seven. He was a captain in the Confederate navy during the civil war, and at its close he went to England and settled at Liverpool, where he lived in retirement. He was the author of *The Secret Service of the Confederate States in Europe, or How the Confederate Cruisers were Equipped* (1883).

Bunce, Francis Marvin, naval officer, born in Hartford, Conn., Dec. 25, 1836; died there, Oct. 19, 1901. In 1851 he entered the naval service, and in 1852 was appointed to the Naval Academy. He was graduated in 1857, and on June 10 was commissioned midshipman and attached to the gunboat *Germantown*, of the East India squadron, June 25, 1860, he was made passed midshipman and assigned to the corvette *Brooklyn*, of the Gulf squadron, then engaged in survey work. He was commissioned lieutenant, April 11, 1861, and in 1862 was appointed executive officer of the

Penobscot. While he was executive officer of the ship it took part in an engagement with the Confederate forces at Yorktown, Va., where he had charge of the debarkation of the heavy artillery for the batteries in the investment of Yorktown. He commanded a successful expedition up Little river, between North and South Carolina, and destroyed several vessels, besides extensive salt-works and large quantities of cotton, turpentine, and rosin, and for these achievements he was mentioned in special orders and commended by the Navy Department. Later the *Penobscot* captured the *Robert Bruce*. He took the vessel to New York in November, 1862, and was then ordered to the South blockading squadron, and took part in the operations on Stono river, South Carolina. Jan. 15, 1863, he was commissioned lieutenant-commander, and on July 10 of the same year he commanded the naval maneuvers in the combined assault of the land and sea forces that resulted in the capture of Morris island. He was again highly commended for these services. He was then attached to the monitor *Patapsco*, and took part in all the actions in the siege of Charleston and in the night attack upon Fort Sumter. For his part in these engagements he received honorable mention. In November, 1863, while in action with the *Patapsco*, he was wounded by the premature explosion of a cartridge. He recovered rapidly, and in January, 1865, he was attached to the staff of Admiral Dahlgren before Charleston, where he was in charge of the scouting and picket boats. He served in this capacity till April 6, when he received command of the *Lehigh*. In September, 1865, he took command of the monitor *Monadnock*, and he was in charge of her when she made her famous trip between Philadelphia and San Francisco. This was the first extended sea voyage of a ship of this class, and Lieut.-Commander Bunce received the thanks of the Navy Department, and was recommended for reward by the Secretary of the Navy. He received his commission as commander on Nov. 7, 1871, as captain on Jan. 11, 1883, and as commodore on March 1, 1895. From 1866 to 1869 he was on duty at the Charlestown Navy-Yard. In 1869 he fitted out the monitor *Dictator* for sea service. In November of that year he assumed command of the *Nantasket*, and was stationed at Santo Domingo. On June 1, 1886, he received the command of the *Atlanta*, the first of the new cruisers. He remained in command of her until Dec. 1, 1889. On Feb. 12, 1890, Capt. Bunce was assigned to the naval station at New London. Later he commanded the new naval training squadron, the *Richmond* being his flagship. March 1, 1895, he was selected to command the North Atlantic squadron, with the rank of active rear-admiral. At the expiration of this service, May 1, 1897, he went to the Brooklyn Navy-Yard, where he supervised the conversion of many fast ships and yachts for use in the war with Spain. He was commissioned rear-admiral Feb. 6, 1898, and retired from active service Dec. 25, 1898. It is said that the policy of the Government in furnishing the navy with abundant ammunition for target practise and giving prizes for the best shots, which produced such remarkable results in the Spanish War, was due to the efforts of Admiral Bunce.

Bunting, Charles A., founder of the Christian Home for Intemperate Men, born in Edgartown, Marthas Vineyard, Mass., Jan. 2, 1828; died in Keyport, N. J., May 30, 1901. At an early age he ran away and went to sea before the mast. Afterward he was for many years a hotel-keeper. During all this time he drank heavily. In 1876 he was

converted under the preaching of Dwight L. Moody, and he at once became interested in the condition of men who were slaves to intemperance. With some outside help he succeeded, in 1877, in establishing in a private house a home where such unfortunates would find a welcome and be treated to every essential bodily comfort, on the condition of reforming their habits. So great was his success that in 1879 \$100,000 was raised—William H. Vanderbilt, Frederick H. Cossitt, Thomas Hope, Hector C. Havemeyer, and others contributing liberally—and the Christian Home for Intemperate Men at Eighty-sixth Street and Madison Ave., New York city, was built. Mr. Bunting remained its resident manager and director till the spring of 1899, when he was retired on a pension, and was succeeded in his work by the Rev. George S. Avery. He afterward resided in Keyport, N. J. Mr. Bunting, who was a constant student of the Bible, advocated a "Gospel method" of treatment, and no cure of any description ever was used in the home. He believed that intemperance was a sin, and that the treatment for it should be the same as for any other sin. He also condemned the use of tobacco, holding that every accessory of the habit should be abandoned, saying that his experience had proved that a rescued man that returns to it will also soon return to drink.

Burgess, Alexander, clergyman, born in Providence, R. I., Oct. 31, 1819; died in Saint Albans, Vt., Oct. 8, 1901. He was a son of Thomas Burgess, a Rhode Island judge, and a younger brother of George Burgess, the first Bishop of Maine. After graduation at Brown University he studied at the General Theological Seminary in New York city, and was ordained deacon in 1842 and priest in 1843. He was successively rector at East Haddam, Conn., 1842-'43; St. Mark's, Augusta, Me., 1843-'54; St. Luke's, Portland, Me., 1854-'67; St. John's, Brooklyn, N. Y., 1867-'69; and Christ Church, Springfield, Mass., 1869-'78. He was consecrated the first bishop of the recently formed diocese of Quincy, in Illinois, in 1878. He was the author of a popular religious text-book, *Questions for Bible-Classes and Sunday-Schools* (1855), and a *Memoir of the Life of George Burgess, First Bishop of Maine* (1869).

Burleson, Rufus C., clergyman and educator, born near Decatur, Ala., Aug. 7, 1823; died in Waco, Texas, May 13, 1901. He was a Baptist, and was elected president of Baylor University, Independence, Texas, in 1853, and served in that capacity till 1861, when he removed to Waco, and established a coeducational school known as Waco University. Waco and Baylor were consolidated into Baylor University in 1885, and Dr. Burleson was made its president and continued in office till 1897.

Burnham, Sarah Maria, educator, born in Chester, Vt., in 1818; died in Cambridge, Mass., Aug. 24, 1901. From 1843 to 1879 she taught in the public schools of Cambridge. She published *Roman Stories in the Time of Claudius*; *The History and Uses of Limestones and Marbles* (1883); *Precious Stones in History and Literature* (1886); *Struggles of the Nations* (1891); *Pleasant Memories of Foreign Travel* (1896); and *Biographical Sketches of Some Ancient People* (1899).

Burr, Franklin Lewis, journalist, born in Hartford, Conn., Dec. 9, 1827; died there, Feb. 2, 1901. He learned the printer's trade, and worked in the office of the *Hartford Times*. From 1854 to 1856 he held a place in the Navy Department in Washington, and after the latter date resided in Hartford. He became an editorial assistant in the *Times* office, and soon afterward, in partner-

ship with his brother, the late John E. Burr, became its owner. He retained the ownership of the paper till 1888, when he sold his interest to his brother, himself remaining a contributor to it. His single public office was one term as state commissioner of Hartford, 1889 to 1891. He was an ardent lover of nature, and wrote many beautiful essays on botany and ornithology, and appreciations of natural scenery.

Burroughs, George Stockton, clergyman and educator, born in Waterloo, N. Y., Jan. 6, 1830; died in Clifton Springs, N. Y., Oct. 22, 1901. He was graduated at Princeton, in 1873, and at Princeton Theological Seminary in 1877. He received the degree of Ph. D. in 1884, and that of D. D. in 1887 from Princeton, and from Marietta College in 1895 the degree of LL. D. He served successively as pastor of the First Church of Christ, Fairfield, Conn., First Church of Christ, New Britain, Conn., and the First Church of Christ in Amherst College. In 1886 he was made Professor of Biblical Literature in Amherst; he served till 1892, when he became president of Wabash College, Crawfordsville, Ind. He retired from that office in 1899 to accept the chair of Old Testament Language and Literature in Oberlin Theological Seminary.

Busiel, Charles Albert, ex-Governor of New Hampshire, born in Meredith, N. H., Nov. 24, 1842; died in Laconia, N. H., Aug. 29, 1901. He was educated at Guilford Academy, and engaged in manufacturing. At his death he was president of the Laconia National Bank and of the City Savings-Bank, and was a director of the Concord and Montreal Railway. He was formerly a Democrat in politics, but in later years he connected himself with the Republican party. From 1872 to 1885 he was chief engineer of the Laconia fire department. He served in the Legislature in 1878-'79, and was a delegate to the Democratic National Convention in 1880. He was the first mayor of Laconia in 1893-'94, and Governor of New Hampshire in 1895-'96. He was a candidate for the United States Senate in 1896, but was defeated.

Butterfield, Daniel, soldier, born in Oneida County, New York, Oct. 31, 1831; died in Cold Spring, N. Y., July 17, 1901. His father, John Butterfield, was one of the first to embark in the express business in the United States, organized the American Express Company, and was its president till his death, in 1869, built the telegraph-line between New York city and Buffalo, and was president of the Overland Express Company, which carried the triweekly mails between San Francisco and Missouri river. Daniel Butterfield was graduated at Union College in 1849, and removed to New York city as general superintendent of his father's express company. At the reorganization of the 12th Regiment of Militia, in 1859, he was chosen as its colonel. On April 12, 1861, the regiment started for Washington, and in July joined the Army of the Potomac, in which its colonel received the command of a brigade. When the army was enlarged he was commissioned a lieutenant-colonel, and assigned to the 12th Regiment of Infantry. In September, 1861, he was appointed brigadier-general of volunteers, and ordered to the corps of Fitz-John Porter. In this capacity he made the campaign of the Peninsula. He was wounded at the battle of Gaines's Mill. His next campaigns were fought under Gens. Pope and McClellan, in August and September, 1862, and at the close of October he took command of Morell's division. He became major-general of volunteers Nov. 29, 1862, and was made colonel of the 5th Infantry in the regular army

July 1, 1863. He commanded the 5th Corps at the battle of Fredericksburg, and was chief of staff in the Army of the Potomac at Chancellorsville and Gettysburg. He was wounded at Gettysburg. He joined the Army of the Cumberland in October, 1863, and acted as chief of staff to Hooker at the battle of Lookout mountain. On the march to Atlanta he commanded a division of the 20th Corps. He was brevetted brigadier and major-general, United States army, for meritorious services. Congress voted a medal of honor to him for conspicuous gallantry at the battle of Gaines's Mill. After the war Gen. Butterfield served as superintendent of the general recruiting service of the army, with headquarters in New York. He was also in command of the forces in New York harbor. In 1869 he resigned from the army to become Assistant Treasurer of the United States, in charge of the Sub-Treasury in New York city. Upon retiring from public office he devoted his attention to business enterprises. He took an active interest in politics and was an earnest adherent of the Republican party. He was a candidate for Congress in New York city in 1892. In 1900 he drew up a bill for submission to Congress for the organization of the United States Reserves. He was appointed by Gov. Roosevelt to attend a conference called by the Governor of Florida to consider plans whereby troops could be raised more speedily in time of war. Gen. Butterfield's scheme called for the uniform organization and instruction of the militia of the country. At the dedication of the National Park at Gettysburg he was marshal of the 10,000 veterans who took part in the ceremonies. He was one of the organizers and the grand marshal of the centennial parade in 1889. He also had military command of the funeral of Gen. William T. Sherman. He was the author of a Treatise on Camp and Outpost Duty. He established a course of lectures in Union College.

Cannon, George Q., Mormon apostle, born in Liverpool, England, Jan. 11, 1827; died in Monterey, Cal., April 12, 1901. His parents were relatives of Apostle Taylor, of the Mormon Church, and the child was reared in that faith. His early boyhood was spent in the Isle of Man, and when twelve years old he was taken by his parents to Canada. Three years later they removed to Nauvoo, Ill., where young Cannon learned to be a compositor, and became one of the most trusted lieutenants of Brigham Young. In 1847 he followed Young to Salt Lake City. Two years later he was sent on a mission tour to California, and thence to the Hawaiian Islands, where he translated the Book of Mormon into the native language. He returned to Salt Lake City in 1854, and in the following year was sent to San Francisco to publish a Mormon paper, *The Western Standard*, and on the breaking out of the Mormon war in 1857 he hurried back to assist in the defense of Zion. In 1860 he was ordained an apostle, and was sent to preside over the Mormons in Europe. He was also in charge of the emigration, and during his short mission sent 13,000 persons to Utah. On his return he became Brigham Young's private secretary, and edited *The Deseret News*. At this time he married two wives in addition to the two he already had. In 1862, when Utah sought admission as a State, Mr. Cannon and W. H. Hooper conveyed the petition to Washington. From 1865 to 1873 he was a member of the Legislative Council of the Territory, and in 1872 again appeared in Washington to urge the admission of Utah. Failing in this, he was elected Territorial Delegate in August, 1872, by an almost unanimous vote, and he con-

tinued to represent Utah in Congress till 1881, when he was forced to retire. During this time, and for many years afterward, he was the target for all the attacks upon Mormonism. But he remained steadfast to his faith, and when compelled to retire, he did so with a reiteration of his belief in the divinity of the polygamous faith. After the death of Brigham Young Mr. Cannon became one of his executors, and when John Taylor was elected president of the Mormon Church, in 1880, Cannon was made first counselor; and from that time he was the ruling spirit of the organization in the defiance of the laws of Congress. During the critical period from 1882 to 1890 Mr. Cannon spent many months in exile to avoid arrest. In 1886 he was taken into custody, and was released on \$45,000 bail, which he forfeited rather than face the judge. After the admission of Utah as a State he and his son, Frank Jenne Cannon, who was United States Senator from Utah from 1896 to 1899, exerted a powerful political influence. Mr. Cannon was ostensibly a Republican in politics, though in many instances he allied himself with the Democrats. When in 1899 he became a candidate for the United States Senate, the Republican Governor of Utah would not appoint him, on account of the doubtfulness of his party loyalty. Lorenzo Snow, when succeeding to the presidency of the Mormon Church as the oldest of its apostles, retained Mr. Cannon in the first presidency of the Church as one of his counselors. Cannon was one of the principal factors, when Mormonism saw the fallacy of its struggle against the civil laws of the country, in separating it from the state and making it a religion pure and simple. In addition to his duties as a priest and a politician, Mr. Cannon was a miner, a merchant, a real-estate owner, a banker, a railroad proprietor, a manufacturer, a farmer, a publisher, an editor, a cattle-raiser, and a business promoter. The estimates of his income from his various interests were as various as they were enormous.

Carleton, George Washington, publisher, born in New York city, Jan. 16, 1832; died in Saratoga, N. Y., Oct. 11, 1901. He was educated at St. Thomas Hall, Flushing, N. Y., and began his business career as a clerk in the importing and commission house of Burnham, Plumb & Co., in New York city. While employed here he utilized his leisure moments in designing illustrations for the comic papers: *The Lantern*, edited by John Brougham, the actor; *The Picayune*, edited by Charles E. Wilbour; and *Young America*, edited by T. W. Strong. In this amateur work he showed talent for humorous sketching with pen and ink, and from it he received an encouraging income. Some of his designs attracted the attention of George Merriam, who asked him to design for his firm an appropriate illustration for a heading to an advertisement of Webster's Dictionary. The sketch accepted, and used for nearly half a century by its purchaser, was of two small cupids overweighted with a very large book, and Mr. Carleton's remuneration for it was a copy of the dictionary bound in calf. In 1857 Mr. Carleton opened a book-shop at 413 Broadway, corner of Lispenard Street, with Edward P. Rudd and his father, the Rev. George R. Rudd, as partners, under the firm name of Rudd & Carleton. Among the first publications of the new firm was William Allen Butler's poem, *Nothing to Wear*, which, though published in a year of panic and failure, at once attained immense popularity. Mr. Carleton began to design the illustrations for this poem, but finally put the work into the hands of his friend, Augustus Hoppin, who made the drawings on wood. The curious

bird-like symbol that was used on all the advertisements and books as the trade-mark of the firm first appeared on Thomas Bailey Aldrich's little poem, *The Course of True Love Never did Run Smooth*, published in the early days of the firm's existence. The story of its origin is told as follows: "Mr. Carleton, who had acquired some knowledge of Arabic, in turning over a volume, looking with Mr. Aldrich for illustrations to his book, found this device, which is an Arabic word signifying 'books.'" Readers puzzled over its meaning, to Mr. Carleton's great amusement. His establishment was the rallying-place of the American comic writers, and he published many of their books. Artemus Ward—His Book, reached a sale of 40,000 copies, and encouraged Mr. Carleton to follow with an almost equal success in the *Life and Adventures of Josh Billings*. This was followed by Billings's *Farmer's Almanac*; the sale began slowly, but within a year this popular burlesque of the familiar *Farmer's Almanac* had reached a sale of 130,000 copies, at great profit to both author and publisher. Mr. Carleton published three humorous books, of his own authorship: *Our Artist in Cuba*, *Our Artist in Peru*, and *Our Artist in Spain and Algiers*, which consisted chiefly of his pictures with brief legends or bits of descriptive text. Among the many native authors introduced to the public through this house were Edmund Clarence Stedman, whose *The Diamond Wedding* was first brought out in book form by Mr. Carleton; Mary J. Holmes, Marion Harland, Miriam C. Harris (author of *Rutledge*), May Agnes Fleming, Richard B. Kimball, and Edmund Kirke. Mr. Carleton early turned his attention to the publication in English of popular French books. He made a most successful venture in bringing out a translation of Michelet's *L'Amour et La Femme*. The second work was translated and delivered to the compositors in seventy-two hours, the translator, Dr. John W. Palmer, having agreed to forfeit ten dollars an hour for every hour beyond that time that the work was kept from the printer. Within thirty days 20,000 copies were sold. The next great enterprise was the translation of the *Les Misérables* of Victor Hugo, translated by Charles E. Wilbour. The volumes were published with rapidity, and although the country was in the midst of civil war the book was a great success. Mr. Carleton then planned to publish the complete works of Balzac, at that time the idol of French novel-readers. The translations were well written by Frank B. Goodrich, but for some unknown reason the American public would not read Balzac, and at the end of the fourth volume the publishers abandoned the project. Edward P. Rudd died in 1861, and the elder Rudd having previously retired, Mr. Carleton continued the business alone until 1871, when he admitted his head clerk, the late George W. Dillingham, into partnership. In 1886 Mr. Carleton retired from business, and the firm was reorganized as the G. W. Dillingham Company. After his retirement from active business Mr. Carleton spent most of his time in traveling.

Cavanagh, James, soldier, born in the County Tipperary, Ireland, about 1830; died in New York city, Jan. 7, 1901. He came to America when sixteen years old, learned the carpenter's trade, and for many years had a shop in Thomas Street, New York. He enlisted in the 69th Regiment, New York National Guard, in 1852, and on March 9, 1857, became 1st lieutenant of his company. He was chosen captain of Company C, Jan. 13, 1859, and marched at its head down Broadway on April 23, 1861, when the regiment went to the civil war. He was highly commended for leading

a gallant charge at the first battle of Bull Run. When the Irish Brigade was organized Captain Cavanagh was promoted major of the 69th Irish Volunteer, and was afterward known as the "Fighting Little Major." He led the 69th Irish Brigade all through the campaign at Yorktown to Antietam. With Col. Meagher he led the noted charge of the Irish Brigade at the battle of Fredericksburg, and fell shot through the body within a hundred feet of the enemy's works. Gen. Meagher said in his report that: "There never was a brighter intellect, a stouter arm, or a braver heart." Major Cavanagh was discharged in May, 1863, on account of disability resulting from his wounds. In the same year he became lieutenant-colonel of the 69th Regiment, and on Nov. 29, 1867, succeeded Martin T. McMahon as colonel. He retained command of the regiment till 1893, when he resigned on account of illness. In recognition of his long and distinguished military career, he was appointed brevet brigadier-general of the National Guard, Nov. 29, 1892. He was appointed special customs inspector of the port of New York by President Arthur, and retained the place till his death. In 1875 he was a candidate for the State Senate on the Republican ticket, but was defeated.

Chamberlain, Nathan Henry, clergyman, born at Monument Beach, Sandwich (now Bourne), Mass., Dec. 25, 1830; died there, April 1, 1901. He was graduated at Harvard in 1853, and studied theology at Harvard Divinity School and the University of Heidelberg. Entering the Unitarian ministry, he was pastor at Canton, Mass., in 1857-'59, and at Baltimore, Md., where he succeeded the Rev. Jared Sparks, in 1860-'63. His theological views underwent a change, and he took orders in the Episcopal Church and was rector in turn of St. Paul's Church, Birmingham, Conn., 1864-'67; Trinity Church, Morrisania, N. Y., 1868-'71; St. James's, Milwaukee, Wis., 1871-'73; Emmanuel, Somerville, Mass., 1874-'79; St. John's, East Boston, Mass., 1882-'89. Retiring from the ministry in the year last named, he devoted his time mainly to literary pursuits. His published works include *The Autobiography of a New England Parish* (1864); *The Sphinx in Aubrey Parish* (1889); *What is the Matter with Our Tariff and its Taxes?* (1890); *Samuel Sewall and the World he Lived In* (1897); *Life of Sir Charles Napier*; and *An Itinerary of Cape Cod*.

Channing, William Ellery, poet, born in Boston, Mass., Nov. 29, 1818; died in Concord, Mass., Dec. 23, 1901. He was the son of Walter Channing, a physician of Boston, and was named for his uncle, the Unitarian theologian. He was educated at the Boston Latin School and Harvard University, and after a year or two of experience in the Western States he married a sister of Margaret Fuller, and settled in Concord, where he passed the greater portion of his life, although he was editorially connected with the *New York Tribune*, 1844-'46, and with the *New Bedford Mercury*, 1855-'56. As one of the contributors to *The Dial*, Channing was identified with the Transcendental movement, and he was the friend and neighbor of Emerson and Thoreau. He published *Poems, First Series* (1843); *Youth of the Poet and Painter*, a series of psychological essays contributed to *The Dial* in 1844; *Poems, Second Series* (1847); *Conversations in Rome between an Artist, a Catholic, and a Critic* (1847); *The Woodman*, and *Other Poems* (1849); *Near Home* (1858); *The Wanderer: A Colloquial Poem* (1871); *Thoreau, the Poet Naturalist*, with *Memorial Verses* (1873); *Eliot: A Poem* (1885); and *John Brown and the Heroes of Harpers Ferry*

(1886). He will probably be longest remembered by the lines, from A Poet's Hope—

Hope hath happy place with me;
If my bark sink, 'tis to another sea.

At his best Channing is stimulating and suggestive, but his verse suffers much from wilful disregard of the requirements of his art.

Channing, William Francis, scientist, born in Boston, Mass., Feb. 22, 1820; died there, March 20, 1901. He was a son of the elder William Ellery Channing. He was graduated at Harvard in 1839, and took a course in medicine at the University of Pennsylvania, receiving his diploma in 1844, but never practising his profession. Even while pursuing these studies he was engaged in 1841 and 1842 on the first geological survey of New Hampshire, and for the two years following was associated with Dr. Henry I. Bowditch in the editorship of the *Latimer Journal* in Boston. With Prof. Moses G. Farmer Dr. Channing worked for the ten years following 1841 in developing the fire-alarm telegraph, and the apparatus, patented in 1857, is still in general use. Nine years later he patented a railroad for transporting ships overland, and in 1877 invented the hand telephone-receiver, which was subsequently purchased by the Bell Telephone Company. He also invented many appliances for use in medical electricity. He was a frequent contributor to scientific journals on electrical subjects and wrote the first books on electricity as applied to medicine. During the abolition movement Dr. Channing was a leader among the agitators.

Chenery, Leonard, naval officer, born in Northampton, Mass., in 1846; died in New York city, March 10, 1901. He was graduated at the Naval Academy in 1865. He was attached to the *Swatara* till 1867, part of the time in the West Indies and part of the time on European stations. From 1867 till 1869 he was attached to the *Guerrière*, the flagship of Rear-Admiral Charles H. Davis, on the Brazilian station. He was flag-lieutenant of the Pacific station on Commodore Stembel's staff from 1871 till 1872, and he was attached to the *Saranac* from 1872 till 1874 on Pacific stations. From 1875 till 1877 he was attached to the monitor *Catskill*, on the North Atlantic station, and from 1879 till 1881 he was stationed at Mare Island Navy-Yard. He was commissioned lieutenant-commander in 1879. He retired from active service Dec. 20, 1881. In the Spanish-American War he volunteered his services, and acted as recruiting officer for the navy in the New York district.

Cheney, Albert Nelson, fish-culturist, born in Glens Falls, N. Y., May 3, 1849; died there, Aug. 17, 1901. He was educated at Glens Falls Academy, Sedgwick School, Mass., and Abbott School, Mass. He was commissioned captain in the 31st New York Volunteers while still under age. In 1870 he began the study of pisciculture, and at his death he was recognized as one of the highest authorities in the subject. He was for nine years a regular contributor to *Forest and Stream*, and he was fishery editor of *Shooting and Fishing*, conducted the *Angling Notes* in the *American Angler*, and was a contributor to the *London Fishing Gazette* and to other periodicals. He was commissioned by the United States Fish Commission to select waters and streams for stocking, and in 1895 he was appointed State Fish Culturist of New York, serving till his death.

Cheney, Person C., ex-Governor of New Hampshire, born in Holderness, N. H., Feb. 25, 1828; died in Dover, N. H., June 19, 1901. At the age of seventeen he took charge of his father's paper-

mill, and in eight years built a larger one. He represented Peterboro in the Legislature in 1853; he was quartermaster of the 13th New Hampshire Regiment from 1862 until 1863, and railroad commissioner from 1864 to 1867, after which time he resided in Manchester. In 1871 he was elected mayor of that city. In 1875 and 1876 he was elected Governor of the State. In January, 1887, he was appointed United States Senator to fill a vacancy. In December, 1892, he was appointed minister to Switzerland, where he served till June, 1893.

Chisnell, Newton Clarence, actor, born in Greensburg, Ohio, in 1857; died in Akron, Ohio, April 10, 1901. His first engagement was with Edwin Booth, although he had appeared previously in amateur performances. He afterward appeared successively with Mary Anderson, Salvini, and the French actress Aimée. He was for several years a leading comedian in Hoyt's farces, acting rôles in *A Trip to Chinatown*, *A Texas Steer*, and *A Temperance Town*. He also acted with Frank Mayo in *Puddin'head Wilson*. His last appearance was with *Way Down East* at the New York Academy of Music, in 1900.

Clarke, Thomas Curtis, engineer, born in Newton, Mass., Sept. 16, 1827; died in New York city, June 15, 1901. He was a younger brother of the late Rev. James Freeman Clarke. He was graduated at Harvard in 1848, studied engineering, and devoted himself to railroad building. He later made bridge engineering his specialty, and designed and constructed some of the most remarkable bridges and viaducts in the country. One of his earliest works was the Chicago, Burlington, and Quincy bridge that spans the Mississippi at Quincy, Ill. This bridge Mr. Clarke built without the intervention of contractors (except for the ironwork). He designed the plant and all the machinery, and, in spite of a season of unusually high water, he opened the bridge for traffic in fifteen months after beginning its construction. Mr. Clarke was the senior partner in the firm of Clarke, Reeves & Co., of Phoenixville, Pa., which afterward became the Phoenix Bridge Company. The work of this company comprised not only many of the most important bridges that have been built, but a considerable part of the elevated railroads of New York. One of the famous works in which he was specially interested while at Phoenixville was the Kinzau Viaduct. In 1884 Mr. Clarke became one of the original members of the Union Bridge Company, which built in Australia the famous Hawkesbury Bridge, considered one of the most brilliant achievements of American engineers in foreign lands, and the bridge across the Hudson at Poughkeepsie, the foundations of which are 135 feet below the water. Of this Mr. Clarke had especial charge. He was president of the American Society of Civil Engineers in 1896, and was Telford gold medalist of the Institute of Civil Engineers of London, England. He wrote many monographs on problems of engineering.

Coles, C. C., inventor and weather-prophet, born in Colesville, N. Y., in 1850; died in Kingston, Pa., Feb. 16, 1901. He was educated at Mount Retirement Seminary. Early in life he studied music, and his method of teaching music by mail in ten lessons first brought him before the public. He was much interested in astronomy, and said he had invented an "electric eye," by which, with some sort of combined telescope and electrical eyepiece, he was able to magnify many hundred times more than the best microscope, and to bring the heavenly bodies much nearer than with the ordinary telescope. He was best known as the publisher of *Storms and Sig-*

nals, a little monthly paper in which he predicted weather conditions in all parts of the world, disasters on land and sea, the sweep of plagues, and the annihilation of nations. He also gave advice as to the best time to grow turnips and other farm produce, and the best time of the month to fish, and illustrated the "high or low tide of the vital forces" by a chart for each day of the month. This paper had a large sale among farmers. He also did a considerable business in the casting of horoscopes.

Cook, Joseph, author and lecturer, born in Ticonderoga, N. Y., Jan. 26, 1838; died there, June 24, 1901. He was the son of a farmer, and was graduated at Phillips Academy in 1857, and in 1858 he entered Yale; but as his health became impaired he was forced to leave college early in 1861. In 1863 he entered the junior class at Harvard, where he was graduated with honors in 1865, and three years later was graduated at Andover Theological Seminary, remaining one year longer there to study advanced religious and philosophical thought. He preached in Andover during 1868-'70, and was acting pastor in Lynn, Mass., in 1870-'71. In 1871 he went to Europe and studied at Halle, Leipsic, Berlin, and Heidelberg, and afterward traveled in Italy, Egypt, Greece, Turkey, and northern Africa. He returned to the United States near the end of 1873, taking up his residence in Boston. His name became familiar to the public in 1875, when as pastor of a Congregational church in Boston he was invited by the Young Men's Christian Association of that city to speak at their Monday noonday meeting. His audiences grew larger, and the lectures finally taxed the full capacity of Tremont Temple. The lectures were given under the auspices of the Young Men's Christian Association till May, 1876, when the Boston Monday lectureship was founded, and the management placed in the hands of a committee representing several evangelical denominations. The object of these lectures was to present the results of the freshest scholarship on the more important and difficult topics concerning the alleged conflict of religion and science. The lectures were every week printed at full length in the newspapers and were read by 250,000 persons in the United States and Canada, besides those in Europe. In 1876 Mr. Cook's lectures and "preludes" first appeared in book form, and in two years they ran through more than 30 editions. In 1878 he delivered 150 lectures, 30 of which were new. During the season of 1878-'79, in addition to the Boston Monday lectureship, he conducted a New York Thursday afternoon lectureship, and spoke on many outside occasions, choosing for these outside lectures the following subjects: Does Death End All? Seven Modern Wonders; Ultimate America; Certainties in Religion; England and America as Competitors and Allies; Political Signs of the Times; Alcohol and the Human Brain; Law and Labor, Property and Poverty; God in Natural Law; Religious Signs of the Times; What saves Men, and Why? and A Night on the Acropolis. In 1880 he began a lecturing tour around the world, on which he was received everywhere by immense audiences. He made 135 public appearances in Great Britain, passed several months in Germany and Italy, and went to India by way of Greece, Palestine, and Egypt. From India his tour extended to China, Japan, Australia, New Zealand, and Hawaii. In Japan he gave 12 lectures—6 in English and 6 through an interpreter—to audiences composed chiefly of Japanese students, teachers, and public men. He returned to the United States in 1882. He made a lecturing tour in Australia in 1895,

and in 1900 resumed the Boston Monday lectures. In 1888 he founded *Our Day*, a monthly paper and review. He published *Boston and the World* (11 vols., 1876-1888); *Congregational Perils*; *Professor Park and his Pupils*; *Memorial pamphlet*, 1899; *The High Court of Arbitration* (1900); and *New Defense of Lord's Day* (1900).

Coston, William Franklin, signal-man, born in Washington, D. C., May 20, 1845; died in New Brighton, Staten Island, N. Y., Aug. 17, 1901. He was graduated at Georgetown College, Washington, D. C., in 1866, and afterward studied abroad. He traveled extensively, and was in France and Germany during the Franco-Prussian War. He was the son of Benjamin Franklin Coston, who invented the signals bearing his name (see *Annual Cyclopædia* for 1897, page 790), and improved and perfected his father's invention. He furnished all the signals used by the United States Government and many other governments.

Cox, Charles Hudson, artist, born in Liverpool, England, Jan. 28, 1829; died in Boulder, Colo., Aug. 7, 1901. He received his education at Kendal Grammar School, Westmoreland, and at Liverpool Institute; and from 1842 to 1888 he was a cotton-broker in Liverpool. In the latter year he moved to the United States, making his home in Waco, Texas, where he continued in the cotton export business till his death. He was said to have been the oldest cotton man, in point of continuous service, in the world. Mr. Cox began his artistic career in Liverpool, where from 1870 till his departure in 1888 he was known as its best amateur water-color artist. He was widely known as a landscape artist in America, and as a member of the Waco Art League won many medals and premiums for water-colors at Waco, Dallas, Houston, and San Antonio. His picture *The Golden Hour* won a premium at the Columbian Exposition in 1893. He was teacher of outdoor sketching at the Texas-Colorado Chautauqua, Boulder, Colo., during the summers from 1898 to 1901. He was Texas correspondent of the *London Daily and Weekly Graphic* from 1890 to 1901. His chief works are marines and views of the River Mersey, and Texas prairie and wild-flower, and Colorado mountain scenery. Among the best are *A Texas Prairie*, *A Thousand Miles from Home*, and *The Golden Hour*—all exhibited at the World's Fair, Chicago, 1893; *The Highest Pine* (Colorado); *Williams Cañon*, Colorado; *A Great Rock in a Weary Land* (Colorado); *The Garden of the Lord* (Colorado); *View from Mount Arapahoe* (Colorado); *Buffalo Clover* (Texas); *An Unwritten Story of the Plains* (Colorado); and a series of paintings illustrating Longfellow's *Evangeline*, presented to the Waco High School.

Crane, Niram Merriam, banker and soldier, born in Penn Yan, N. Y., Dec. 13, 1828; died in Wayne, N. Y., Sept. 25, 1901. He was a private banker in Hornellsville, N. Y., at the outbreak of the civil war, and in April, 1861, he closed his bank to raise a company for the 23d New York Volunteers. He participated in the battles of Rappahannock, Groveton, Chantilly, South Mountain, Antietam, and Fredericksburg, and served on the staffs of Gen. Reynolds and Hooker. He was chosen colonel of the 107th New York Regiment and joined it at Leesburg, Va., while it was on its march to Gettysburg. He displayed great gallantry in the battle of Gettysburg, and afterward under Gen. Hooker joined Gen. Sherman at Chattanooga and participated in the march to the sea. He was brevetted, March 13, 1865, brigadier-general of volunteers for gallantry during the campaign in South Carolina. At the close

of the war he resumed his banking business in Hornellsville and conducted it till 1893. He was an original trustee of the Soldiers' Home in Bath, N. Y., and was its first treasurer.

Crocker, Margaret Eleanor, philanthropist, born in Stark County, Ohio, Feb. 25, 1823; died in New York city, Dec. 1, 1901. She was the daughter of John Rhodes, a pioneer of Stark County, and the youngest of twelve children. While Margaret Rhodes was a babe, the father died, leaving the mother, with the aid of the older children, to wring a livelihood from the half-cleared land. The mother died in 1848, and the family was broken up. While visiting her sister in South Bend, Ind., in 1850, Margaret met Edwin B. Crocker, then a young lawyer, who had studied for his profession while working in a foundry. The couple were married by Henry Ward Beecher, July 8, 1852, and a few days afterward they set out by the long isthmus route for California. Here Mr. Crocker struggled through the deepest poverty and many privations to a high place in his profession, a justice of the Supreme Court of California, and became one of the wealthiest men in the country. Judge Crocker and his wife devoted much of their wealth to charities and to beautifying the city of Sacramento. After the death of her husband, in 1875, Mrs. Crocker increased her charities. She gave to Sacramento land for a cemetery, a great school building, and a magnificent art gallery, the contents of which, carefully collected in Europe, were valued at more than \$500,000. She also founded and endowed an old ladies' home in that city. During her later years she resided in New York city, and there gave liberally in public and private benefactions.

Croly, Jennie Cunningham, editor, born in Market Harborough, England, Dec. 19, 1829; died in New York city, Dec. 23, 1901. At the age of ten she removed to Poughkeepsie, N. Y., and in 1856 she married David G. Croly, a journalist, who died in 1889. She was one of the first women to enter the profession of journalism, and in a career of forty years was connected editorially with various newspapers and periodicals. Her longest service was as editor of *Demorest's Magazine* (1860-1887). She founded *Sorosis*, a woman's club, in 1868, and was its president in 1868-'70, and in 1876-'86. She also founded the *Women's Press Club* and was its first president, and in 1899 a publication entitled *The New Cycle*, and she was the first president of the *New York State Federation of Women's Clubs*. Her publications in book form include *Talks on Women's Topics* (1869); *For Better or Worse* (1875); a cookery book; and a *History of the Woman's Club Movement in America*. Much of her work was published under the pen-name of Jennie June.

Crowell, Floy (Mrs. Edwin Dudley), actress, born in Cleveland, Ohio; died in Los Angeles, Cal., Jan. 31, 1901. She made her first appearance in a small western stock company, and played, during a period of ten months, more than 30 leading rôles, ranging from Marjorie, in the *Rough Diamond*, to Lady Audley, in *Lady Audley's Secret*, and Lady Isabel, in *East Lynne*. Soon after the termination of this engagement she traveled through the New England States with her own company. She played chiefly in that territory during the rest of her stage career, appearing most successfully in *The Ironmaster*, *Queen of the Night*, and *The Wages of Sin*.

Curry, Robert, educator, born in Murraysburg, Pa., June 8, 1821; died in Allegheny, Pa., Dec. 13, 1901. He taught in the public schools before entering the academy at Frankfort Springs, Pa., and was graduated at Washington and Jef-

ferson College in 1848. He became principal of West Newton Academy, and of a school at Canonsburg, Pa.; in 1855 established the first normal school in western Pennsylvania, in Mansfield, and in 1859 became principal of New Brighton Female Seminary. In 1860 he founded, in Pittsburg, Curry University, with three departments—classical, normal, and chemical. In 1873 Prof. Curry was appointed Deputy Superintendent of Public Instruction of Pennsylvania, and after his term in that office he removed to the West, where he was engaged in active educational work till his retirement in 1900. During these last years he was for a time principal of the Nebraska State Normal School, and for several years he served as president of the State Teachers' Association of Nebraska. He received the degree of Ph. D. from Washington and Jefferson College in 1873.

Curtiss, James Edward, soldier, born in Mohawk, N. Y., Oct. 1, 1840; died in Buffalo, N. Y., July 23, 1901. He was educated in the common schools of his native country, and when the civil war broke out he became a captain in the 152d New York Volunteers. The following year he was made major, and soon afterward lieutenant-colonel. He received his commission as colonel, June 1, 1865. In the previous March he was brevetted brigadier-general for faithful and meritorious services during the war. He was police commissioner of Buffalo from Jan. 1, 1895, till March 1, 1899. He was connected with many business enterprises.

Cushing, Samuel T., soldier, born in Rhode Island in 1839; died in Washington, D. C., July 21, 1901. He was educated at West Point, and was commissioned 2d lieutenant in the 2d United States Infantry, Jan. 19, 1861; 1st lieutenant, May 14; and captain, Feb. 15, 1862. He was made commissary of subsistence, Feb. 9, 1863, and thereafter served in the commissary and signal branches of the service. He was the first regular officer detailed for duty with the signal corps of the army at the outbreak of the civil war, and at Fredericksburg, Va., established the first line of military telegraph ever used in actual warfare and exposed to the enemy's fire. He was brevetted major, March 13, 1865, for gallant and meritorious conduct in the field. He was commissioned major of the volunteer signal corps, May 29, 1863, but declined the commission. In the regular establishment he was major and commissary of subsistence, Aug. 28, 1888; lieutenant-colonel and assistant commissary-general, Nov. 11, 1895; colonel and assistant commissary-general, Jan. 26, 1897; and brigadier-general and commissary-general, Jan. 28, 1898. He was retired for disability, April 21, 1898.

Daggett, Mrs. Lydia (Hill), missionary, died in Wyoming, Oct. 2, 1901. At the time of the civil war she spent two years in the South, chiefly in New Orleans, where her work was personally furthered by Gen. Butler, laboring for the relief and education of the colored people. From 1871 to 1882 she was the publisher of the *Heathen Woman's Friend* (now the *Woman's Missionary Friend*), the organ of the *Woman's Foreign Missionary Society of the Methodist Episcopal Church*. She afterward engaged actively in the home missionary work of her Church until 1895. She was made district secretary, and founded the *Jesse Lee Home* in Alaska, to which she gave personal supervision. She also aided in establishing the *Lyndon Home* for Indians in Washington.

Davis, Kate, actress, born in Boston, Mass., in 1863; died in Washington, D. C., Jan. 12, 1901. She was a graduate of the Boston School of Oratory, and her first appearance was as a public reader, after which she began her career as an

actress in the company of Effie Ober, shortly afterward joining the Hanlons, playing the title rôle in *Fantasma*, in which she appeared for nearly two years. She possessed a fine soprano voice, and her theatrical work was divided between light opera and the drama, with much success in both. She sang one season with the famous Boston Ideal Opera Company; she played leading rôles one season in the company of Dan Maguinness, and she made a notable success as Violet Hughes in Hoyt's *A Tin Soldier*. In 1891-'92 she played the Spanish mother in Mrs. Leslie Carter's production of *Miss Helyett*, after which she became a member of the Manola-Mason Company of Boston, and of Donnelly and Girard's company, playing in *The Rainmakers*. She also appeared in England, and achieved success in that country.

Dean, Sidney, clergyman and Congressman, born in Glastonbury, Conn., Nov. 16, 1818; died in Brookline, Mass., Oct. 29, 1901. He was educated at Wilbraham Academy, Massachusetts, and Suffield Academy in his native State, and entered the Methodist ministry in 1843. In 1855-'59 he represented his district in Congress, and was Washington correspondent of the *New York Independent*. He held pastorates at Pawtucket, R. I., 1859-'61; Providence, 1861-'63; and Warren, R. I., 1863-'65. During the next ten years he was editorially connected with Providence newspapers, retiring from journalism in 1880 to devote himself to literature and lecturing. His last ten years were spent in retirement at Brookline. In 1884 he published *A History of Banking and Banks, from the Bank of Venice, 1171 to 1883*.

De Cordova, Raphael J., lecturer and humorist, born in Jamaica, West Indies, in 1822; died in London, England, April 4, 1901. He removed to New York city in 1849, and was employed in the commission house of Aymer & Co. till 1870. In that year, with his two sons as partners, he established a tea business in New York. The firm was dissolved in 1885, and after 1893 Mr. De Cordova resided in London. During the financial panic of 1857 he turned to the lecture platform, on which he had already achieved success. His subjects were humorous and the lectures very popular. He was a regular contributor to the New York newspapers, and wrote several books, one of which, *The Prince's Visit*, published shortly after the visit of the Prince of Wales to the United States, had a large sale. He was an expert linguist.

De Forest, Augusta, actress, born in White Plains, N. Y., in 1845; died in New York city, Oct. 20, 1901. She made her début in her early girlhood, played first in stock companies, and rose quickly to be leading lady. She played at various times in support of John McCullough, Adelaide Neilson, Edwin Booth, Lawrence Barrett, William J. Florence, and other stars. For several years she was leading woman at Wood's Museum, and at one time she was a member of Augustin Daly's company. In her last years she played in support of Margaret Mather, Belle Archer, and Grace George. She married George Hill, a New York merchant, who died soon afterward.

De Groot, Ann Boylan, philanthropist, born in Mendham, N. J., Feb. 28, 1813; died in Mount Tabor, N. J., July 10, 1901. She was a daughter of Joseph A. Boylan. Her husband, Alfred De Groot, died in 1869, leaving her a considerable fortune, which she devoted almost entirely to church and charitable work. She was the founder of the De Groot Methodist Episcopal Church, in Newark, N. J., and paid for its first edifice. She was a member of the charter Board of Trustees and Board of Managers of the Newark Home for

the Friendless, founded in 1874, and continued until her death. She was interested in the work among the negroes, both in the North and in the South, and founded and was the financial support of the Boylan Home for the Colored Children in Jacksonville, Fla. She was also a large contributor to the Central Baptist Church, in Newark, of which she was a member, and to the Mount Tabor camp-meetings, one of which she had attended since 1870.

De la Harpe, Joseph A., scenic artist, born in Switzerland, about 1850; died in Brooklyn, N. Y., Feb. 11, 1901. When a boy he emigrated with his mother, who settled with him near Salt Lake City. He made many sketches and paintings of animals for Brigham Young, some of which are in the museum of the Smithsonian Institution in Washington. His portraits of Brigham Young and other Mormon notables are in the Mormon Temple, in Salt Lake City. His first engagement in the East was in making sketches for Augustin Daly. He painted the scenery for Edwin Booth's theater. Altogether he painted the scenery for 47 theaters, 24 of which were in New York and Brooklyn.

Denison, Frederic, Baptist clergyman, born in Stonington, Conn., Sept. 28, 1819; died in Providence, R. I., Aug. 16, 1901. He was graduated at Brown University in 1847, and in the autumn of the same year he was ordained pastor of the First Baptist Church of Westerly, R. I. In November, 1854, he was made pastor of the Central Baptist Church, Norwich, Conn., where he remained until 1859, when he took charge of a church in Central Falls, R. I. In 1861 he became chaplain of the 1st Rhode Island Cavalry. Later he joined the 3d Rhode Island Heavy Artillery in the same capacity, and served through the war. In 1865 he resumed charge of the church in Westerly, where he remained till 1871. For the following two years he was pastor of a church in New Haven, Conn., and for the succeeding three years in Woonsocket, R. I. After that he was pastor for a few years of the Roger Williams Baptist Church in Wanskuck. He then retired, and afterward made his home in Providence. He wrote many historical sketches, army hymns, pamphlets upon current subjects, memorial discourses, and miscellaneous hymns, poems, and newspaper and magazine articles, and was the author of the following books: *The Supper Institution*; *The Sabbath Institution*; *Notes of the Baptists and their Principles in Norwich, Conn.*; *The Evangelists—Life of Jabez S. Swan*; *Westerly and its Witenesses*; *Sabers and Spurs—the History of the 1st Rhode Island Cavalry*; *Shot and Shell—the History of the 3d Rhode Island Heavy Artillery*; *Picturesque Rhode Island*; and *Illustrated New Bedford, Marthas Vineyard, and Nantucket*.

De Puy, William Harrison, clergyman, born in Penn Yan, N. Y., Oct. 31, 1821; died in Canaan, Conn., Sept. 4, 1901. He was graduated at Genesee College (now Syracuse University), entered the ministry of the Methodist Episcopal Church in 1845, and was engaged in pastoral work until 1849, when he became the financial agent of Genesee College. The following year he was made principal of the teachers' department of Genesee Wesleyan Seminary, and Professor of Mathematics and Natural Philosophy in the seminary. He was pastor of Grace Methodist Episcopal Church, in Buffalo, in 1855, and successively served the full pastoral term in each of the Methodist churches then in that city. During part of that time he was editor of the *Buffalo Christian Advocate*. In 1865 he was appointed assistant editor of the *Christian Advocate* of New York, and he filled

that office about twenty-five years. He was editor of the *Daily Christian Advocate* during the quadrennial General Conferences from 1860 to 1888, one of the managers of the Methodist Sunday-School Union for more than thirty years, and editor of the Methodist Year-Book from 1866 to 1889. In New York he served as pastor of the old John Street Methodist Episcopal Church four years. He received the degree of M. A. from Genesee College, that of D. D. from Union College, and that of LL. D. from Mount Union College, Alliance, Ohio. Dr. De Puy was author or editor of the following books: *Three-score Years and Beyond* (1877); *Compendium of Useful Information* (1878); *The People's Cyclopædia of Universal Knowledge* (1879); *Home and Health and Home Economics* (1880); *The People's Atlas* (1882); *Methodist Centennial Year-Book* (1889); *American Revisions and Additions to Encyclopædia Britannica* (1891); and *University of Literature* (1896).

Dickinson, Leonard A., soldier, born in New Haven, Conn., Nov. 5, 1826; died in Hartford, Conn., Jan. 27, 1901. He was left an orphan at an early age, and earned the greater part of his livelihood after he was nine years old. While a young man he was a member and an officer of various military companies in New Haven and Hartford, and in October, 1861, he enlisted in the 12th Connecticut Volunteers. He was commissioned captain in that regiment, mustered into service in January, 1862, and served with it in the engagements about New Orleans under Gen. Butler, and later in the Shenandoah valley. In 1864 he was made assistant acting adjutant-general of the 19th Army Corps, and in that capacity he was in the campaigns of Gen. Sheridan. He was mustered out of service Nov. 21, 1864. After 1869 he engaged in the insurance business, and for many years he was president of the Hartford Board of Underwriters. Throughout his life after the war he was intimately connected with the political life of the State. He served for three years as quartermaster on the staff of Gov. Jewell. He was appointed postmaster of Hartford by President Garfield, and held the office through President Arthur's administration. He had served continuously on the Soldiers' Hospital Board after 1886, and was a trustee and treasurer of the Fitch Soldiers' Home, in Noroton, Conn., and as the executive officer representing the State he was largely instrumental in putting the institution on a sound basis.

Dillingham, Annie (Mrs. William Dawes), actress, born in New England; died in Brooklyn, N. Y., March 15, 1901. She made her first appearance at the Boston Museum, playing the leading rôle in *The Love Chase*, supported by the veteran actor, William Warren. She afterward acted in various stock companies throughout the country, and once, during the civil war, when she and her company were in a town that had been captured by Morgan's guerrillas, the entire wardrobe and properties of the actors were saved by her intercession with Morgan himself. While Miss Dillingham was playing in the West Indies she met William Dawes, a merchant of British Guiana, and shortly afterward married him, retiring permanently from theatrical life.

Dimitry, John (Bull Smith), author, born in Washington, D. C., Dec. 27, 1835; died in New Orleans, Sept. 7, 1901. He was the son of Prof. Alexander Dimitry. He was graduated at Georgetown College, and from 1859 to 1861 was secretary of legation to his father, who was United States minister to Costa Rica and Nicaragua. He was connected editorially with newspapers in

New Orleans, Washington, New York, and Philadelphia, and while on the New York Mail and Express his story *Le Tombeau Blanc* won the prize of \$500 offered by The Storyteller for the best short story. He was Professor of Languages and Belles-Lettres, Colegio Córdas, South America, from 1873 to 1876, and he held the same chair in Montgomery College, Virginia, in 1894-'95. He gained considerable reputation as a writer of epitaphs, and was the author of *The Life of Jefferson Davis*, written, with John C. Ridpath, in collaboration with Mrs. Jefferson Davis; *School History and Geography of Louisiana* (1877); *Three Good Giants* (1887); *Atahualpa's Curtain* (1889); and the *Confederate Military History of Louisiana* (1900).

Donahoe, Patrick, publisher, born in Munery, County Cavan, Ireland, March 17, 1811; died in Boston, Mass., March 18, 1901. He attended the public schools of Boston, whither he had come with his parents when ten years old, and afterward worked as a compositor in the office of the *Columbian Centinel*, and later on the *Boston Transcript*. In 1836 he founded *The Pilot*, in the interest of the Catholics of the United States, which, through his personal canvass, attained a wide circulation. In addition to his newspaper he established a large book-publishing house, and subsequently added a bookstore and an emporium of organs and church furniture. During the civil war he actively interested himself in the organization of Irish regiments. He was treasurer of the fund for the equipment of the Irish 9th, and when the regiment was departing for the field he presented Col. Cass with \$1,000 in gold for distribution among the men. He assisted in the formation of the 28th Massachusetts Regiment, and generously aided the soldiers at Camp Cameron, Cambridge, during the early days of the war. In 1872, when his chapter of misfortune began, Mr. Donahoe was the richest Catholic in New England, and his large fortune was drawn on freely for churches and philanthropic interests. The great fire of 1872 destroyed his buildings, stereotype plates, book stock, and other property to the value of \$350,000. He at once resumed business, but was burned out again in May, 1873. He built again, and a third time was burned out. The insurance companies had nearly all collapsed through the losses incurred in the great fire, and in consequence his losses were almost total. In addition, he had indorsed heavily for friends, and through his generosity in this direction he lost more than \$250,000. Then the panic of 1876 came, and friends that had advanced money to carry on the business withdrew their assistance. His bank was obliged to suspend payment, and Mr. Donahoe, to repay the \$73,000 due depositors, put everything he possessed at the disposal of his creditors. *The Pilot* was purchased by Archbishop Williams and John Boyle O'Reilly. The latter, who for some years had been in editorial charge of the paper, now assumed the additional duties of business manager. Meantime; Mr. Donahoe was beginning business life anew. He resumed his foreign exchange and passenger agency, and in 1878 established *Donahoe's Magazine*. To gain a circulation for it, he went over the same ground that he had traversed in young manhood in the interests of *The Pilot*. Success came to him, and in 1890, after the death of John Boyle O'Reilly, Mr. Donahoe, then nearly eighty years old, bought back *The Pilot*. In 1894 he sold *Donahoe's Magazine*. On March 17, 1893, he was awarded the Lætare medal by Notre Dame University, given each year to some Catholic "especially distinguished for his services to

religion and to his fellow men," and on May 8, 1894, he was tendered a complimentary dinner by the representative citizens of Boston, at which more than 300 were present.

Donnelly, Ignatius, author, born in Philadelphia, Pa., Nov. 3, 1831; died in Minneapolis, Minn., Jan. 1, 1901. He was educated in the public schools of his native city, was graduated at the Central High School in 1849, and was admitted to the bar in 1852. He removed to St. Paul, Minn., in 1856, and in 1859 was elected Lieutenant-Governor of Minnesota on the Republican ticket. He served in Congress from December, 1863, till March, 1869. Then, having been defeated for another reelection, he entered the Democratic party. He took the stump for Horace Greeley in 1872, and was president of the anti-monopoly convention that nominated Peter Cooper for the presidency in 1876. In 1873 he was elected to the State Senate, and served many years as Democratic member of that body and of the House. Sept. 6, 1898, he was nominated for the vice-presidency of the United States by the convention of the People's party in Cincinnati, Ohio, and in May, 1900, he was nominated for the same office by the Middle-of-the-Road division of the People's party in their convention in Sioux Falls, S. Dak. For five years he published in St. Paul *The Antimonopolist*, a weekly paper in which he advocated the Greenback policy, and during his last years, in addition to conducting a large farm, he edited *The Representative*, a reform journal published in Minneapolis. For several years previous to 1894 he was president of the Farmers' Alliance of Minnesota. After publishing several minor works, among them an *Essay on the Sonnets of Shakespeare*, he brought out his *Atlantis, the Antediluvian World* (1882), in which he attempted to prove that a great island continent, the Atlantis of the ancients, once extended from the West Indies nearly to Europe; that civilization originated there and spread to both the adjacent continents; that the island sank in a great convulsion, and that the islands of the Atlantic are such parts of it as were too high to be submerged. Afterward he published *Ragnarok* (1883), an attempt to prove that the deposits of clay, gravel, and decomposed rock characteristic of the drift age, were the result of contact between the earth and a comet; and *The Great Cryptogram*, in which he attempted to demonstrate by an alleged cipher (which was quite clear to him, but to no one else) that Lord Bacon was the author of the plays attributed to Shakespeare. He afterward applied this cryptogram with equal success to *Don Quixote*. His other books were *Cæsar's Column: A Story of the Twentieth Century* (1890); *The Golden Bottle*, a political novel (1892); *Doctor Huguet*; and *The American People's Money*. He wrote the preamble to the Omaha platform of the People's party, which has been regarded in the light of a party creed. While in Congress, Mr. Donnelly earnestly advocated the creation of the National Bureau of Education, and he was the first man that ever agitated in Congress the question of the planting of trees by the Government.

Dougherty, Andrew, inventor and manufacturer, born in Ireland in 1826; died in New York city, March 4, 1901. He came to New York when nine years old, and soon afterward ran away to follow a seafaring life till 1848, when he returned and set up a small establishment for the manufacture of cards at 48 Ann Street. The business grew till it was one of the most important of its class in the United States. Most of the devices now used in the making of cards

were his inventions, and he was the originator of a paper-wetting appliance and of the rollers of the country used in preparing paper for the press up to the time of their use in the web perfecting press, which uses the rollers.

Douglass, Andrew Ellicott, geologist, born in West Point, N. Y., Nov. 18, 1818; died in New York city, Sept. 30, 1901. He was the son of Major David Bates Douglass, U. S. Army, and graduated at Kenyon College in 1838. In 1839 he engaged in business in New York in what afterward became the Hazard Powder Company, of which he became president in 1867. In 1876 he retired from active business, and thereafter devoted his time to the study of archeology, and chiefly to the investigation of Indian remains in the United States. He spent ten winters in Florida, locating and exploring more than 50 Indian mounds and collecting more than 22,000 archeological specimens, now exhibited in the American Museum of Natural History in New York city. Mr. Douglass was the author of many papers on archeology.

Draper, Herbert Lemuel, officer in the United States Marine Corps, born in Papernville, Canada, Dec. 24, 1866; died in Hong-Kong, China, in September, 1901. He was appointed to the Naval Academy in 1883; became 2d lieutenant Marine Corps, July 1, 1889; 1st lieutenant, July 1, 1891; and captain, March 3, 1899. His first conspicuous service was in 1893, at the time of the troubles in Hawaii, when he commanded the marines sent ashore from the Boston to preserve order and to protect American interests in Honolulu. In the Spanish-American War he served as adjutant of Col. Huntington's battalion, and for conspicuous service in the occupation and defense of Guantanamo, where he was the first to raise the United States flag on Cuban soil, he was brevetted captain. Afterward he was sent to the Philippines, where, on his post at Subig, he rendered efficient service, and for a time served as collector of customs for the district.

Draper, William Henry, physician, born in Brattleboro, Vt., Oct. 14, 1830; died in New York city, April 26, 1901. He was graduated at Columbia College in 1851. While attending college he played the organ in St. Thomas's Church, then at Broadway and Houston Street. He was graduated at the College of Physicians and Surgeons in 1855, and took the degree of M. A. at Columbia the same year. He then studied in Paris and London, and in 1869 was appointed Clinical Professor of Diseases of the Skin at the College of Physicians and Surgeons. After a time he retired from that professorship to take that of Clinical Medicine in the same college. He held that post from 1879 to 1898, when he retired, but was appointed emeritus professor. Dr. Draper became attending physician in the New York Hospital in 1862, and acted until 1889, when he retired on account of failing health, but took up the service again in 1893. He served the hospital in all thirty-nine years. He was connected with the New York House of Mercy, St. Luke's and Roosevelt Hospitals, and the Northwestern Dispensary. In 1893 he was Roosevelt's president of the Medical Board. During the civil war he made a trip to the peninsula in connection with the Sanitary Commission. Dr. Draper was a general practitioner, always objecting to specialization.

Drysdale, William, journalist and author, born in Lancaster, Pa., July 11, 1852; died in Cranford, N. J., Sept. 20, 1901. He received his early education from his father, and was for a time a student at Columbia Law School. His

reporting of the trial of Henry Ward Beecher, in 1874, for the New York Sun, put him in the first rank of newspaper reporters. For one year, 1876, he was city editor of the Philadelphia Times, and in 1877 he joined the staff of the New York Times, with which paper he was connected for more than twenty years. In 1879 he was sent by his paper into Mexico and Cuba, and much of his time thereafter was spent in those countries. He also did correspondence work in Europe. His stories for boys, drawn chiefly from the experiences of his wanderings in the Antilles, achieved a wide popularity. He published Proverbs from Plymouth Pulpit (selections from the writings and sayings of Henry Ward Beecher); In Sunny Lands: Outdoor Life in Nassau and Cuba; The Princess of Montserrat: The Mystery of Abel Forefinger: The Young Reporter; The Fast Mail; The Beach Patrol: The Young Supercargo; Cadet Standish of the St. Louis; Helps for Ambitious Boys; Helps for Ambitious Girls; and the Treasury Club.

Du Barry, Beekman, soldier, born in Bordentown, N. J., Dec. 4, 1828; died in Washington, D. C., Jan. 12, 1901. He was the eldest son of Dr. Edmund Louis Du Barry, a surgeon in the United States navy. His mother was the youngest daughter of Col. William Duane. He was graduated at West Point in 1849, and assigned, as a brevet 2d lieutenant, to the 1st Artillery. In September of that year he sailed with his company for Florida, where he served against the Seminoles until September, 1850. He then served as Assistant Professor of Ethics at West Point until April, 1853, when he went for three months on exploration duty in connection with the first reconnaissance for a Northern Pacific Railroad route. After his return he was on duty as Assistant Professor of French at West Point until May, 1854, when he went with his company, by way of the Isthmus, to San Diego, Cal., and thence to Fort Yuma, Cal., serving there till September, 1856. He had been made 2d lieutenant of Light Battery E, 3d Artillery, Feb. 13, 1850, and 1st lieutenant, Dec. 24, 1853, and during much of the time he was in command of his company, was also post commissary, and as acting assistant quartermaster designed and constructed the buildings at Fort Yuma. In November, 1856, he went to Fort Snelling, Minn., and in the following year served in the expedition against the Sioux Indians on Yellow Medicine river; and later served in Kansas in quelling the disturbances connected with the formation of a State Constitution in 1857-'58. In the winter of 1857-'58 he was detailed to examine the Missouri river from Fort Leavenworth to the mouth of the Platte, and to select a site for a depot for the army in Utah. The following September he marched with the battery from old Fort Scott, Kansas, through Missouri and western Iowa, to Fort Ridgely, Minnesota., where he was on duty till the spring of 1859. After a four months' leave of absence he again served as Assistant Professor of French at West Point till May 11, 1861, when he was appointed captain and commissary of subsistence and ordered to Harrisburg, Pa. He organized the supply for Gen. Patterson's army on the line to Harpers Ferry, and forwarded by rail the troops arriving there in the first months of the war. From December, 1861, till September, 1862, he served as chief commissary in western Kentucky, West Tennessee, and northern Mississippi. From October, 1862, until December, 1864, he was purchasing and depot commissary at Cincinnati, Ohio, and he was then ordered to Washington as assistant to the commissary-general of subsistence, in whose office he

served until Nov. 3, 1873. He was then on purchasing and depot duty in St. Paul, Minn., till September, 1876; in Boston till May, 1877; and in New York till August, 1879. He served at the Military Academy from September, 1879, until September, 1881. He was brevetted lieutenant-colonel and colonel, March 13, 1865, for faithful and meritorious service during the war, and received the rank of major, Feb. 9, 1863; lieutenant-colonel, May 20, 1882; and colonel, Sept. 3, 1889. From April, 1882, he served as assistant to the commissary-general of subsistence until July 10, 1890, when he was appointed commissary-general of subsistence with the rank of brigadier-general, which post he filled until his retirement, Dec. 4, 1892.

Duffield, John Thomas, clergyman and educator, born in McConnelburg, Pa., Feb. 19, 1823; died in Princeton, N. J., April 10, 1901. He was graduated at Princeton in 1841, and took charge of the mathematical department of Union Academy, Philadelphia. He entered Princeton Theological Seminary in 1844, and in 1845 he was appointed tutor of Greek in Princeton. From 1847 till 1854 he was Adjunct Professor of Mathematics, and in 1854 he was appointed to a full professorship. He was licensed to preach in 1849, and for several

years he filled the pulpit of the Second Presbyterian Church in Princeton, in the founding of which he was mainly instrumental, and at the time of his death he was president of the board of trustees. In 1865 he was moderator of the Synod of New Jersey. The degree of D. D. was conferred upon him by Princeton in 1872, and Lake Forest University in 1890 gave him the degree of LL. D. Prof. Duffield was an abundant contributor to current religious literature, and he had written a great deal in the last years of his life in advocacy of the revision of the Westminster Confession of Faith, being one of the few Princeton professors that advocated the movement. After his retirement from active class-room duty he was chairman of the Faculty Committee on Scholarships and Charitable Funds, and in the administration of this office he came notably into sympathetic touch with the students.

Dunglison, Richard James, physician and editor, born in Baltimore, Md., Nov. 13, 1834; died in Philadelphia, Pa., March 5, 1901. He was a son of Prof. Robley Dunglison, of Jefferson Medical College, and studied medicine under his father's direction. He was graduated at Jefferson Medical College in 1856. From 1862 till 1865 he served as acting assistant surgeon of the United States army, on duty in the military hospitals in Philadelphia. He was one of the originators of the Philadelphia Medical Times; edited Dunglison's Medical Dictionary, Dunglison's History of Medicine, etc., and was the author of Practitioners' Reference Book; Handbook of Diagnosis, Therapeutics, and Dietetics; The Present Treatment of Disease; a New School Physiology and Hygiene; Elementary Physiology and Hygiene;

and Surgical Diseases of Children (translated from the French by Guersant). He also edited and began the publication of *Dunglison's College and Clinical Record* in 1899.

Durfee, Thomas, jurist, born in Tiverton, R. I., Feb. 6, 1826; died in Providence, R. I., June 6, 1901. He was a son of Job Durfee (1790-1847). Both father and son were graduates of Brown University, and each was Chief Justice of the Supreme Court of Rhode Island. Thomas Durfee was graduated at Brown University in 1846, was admitted to the bar in 1848, and was reporter of the Supreme Court from 1849 till 1853. He then served as judge in the Court of Magistrates in Providence six years, one year as assistant and five years as presiding judge. He was a member of the Legislature from Providence, was speaker of the House from 1863 till 1865, and was in the Senate the following year, till he went upon the Supreme Court bench. In 1865 he became Associate Justice of the Supreme Court of Rhode Island, and in January, 1875, he was elected Chief Justice. From that time till March 14, 1891, when he resigned, Judge Durfee was at the head of the judiciary of the State, and his opinions are notable for their literary quality, force, and logic. During the civil war his pen and voice were powerful in the support of the National cause. He was Chancellor of Brown University from 1879 till 1888, and a trustee from 1876 till 1888. He received the degree of LL. D. in 1875. In addition to his many legal papers he published *The Complete Works of Job Durfee*, with a *Memoir of his Life* (1849); *Reports of Cases in the Supreme Court of Rhode Island*, 2 vols. (1851-'53); *Oration at Providence*, July 4, 1853; *Treatise on the Law on Highways*, begun by Joseph K. Angell and published in 1857; *Village Picnic*, and *Other Poems* (1872); *Gleanings from the Judicial History of Rhode Island* (1883); and *Some Thoughts on the Constitution of Rhode Island* (1887).

Eaton, C. Harry, artist, born in Akron, Ohio, Dec. 13, 1850; died in Englewood, N. J., Aug. 4, 1901. He taught himself his art. Among the rewards he received were a silver medal in Boston in 1887, a gold medal at the Prize Fund Exhibition at the American Art Galleries in New York city in 1888, and the William T. Evans prize at the American Water-Color Society Exhibition in 1898. His home was in Leonia, N. J., and the greater part of his work was done in New York. He was an associate of the National Academy of Design and secretary of the American Water-Color Society. His painting *Lily Pond* is owned by the Detroit Museum of Art.

Edwards, Arthur, clergyman and editor, born in Norwalk, Ohio, Nov. 23, 1834; died in Chicago, Ill., March 20, 1901. He was graduated at Ohio Wesleyan University in 1858, and immediately began work under the Detroit Conference of the Methodist Church, and was stationed at Marine, Mich. At the outbreak of the civil war he was appointed chaplain of the 1st Michigan Infantry, and he remained with the regiment till after Gettysburg, when he received the command of a cavalry regiment. After the war he was a publisher of Methodist literature. He became assistant editor of the *Northwestern Christian Advocate* in 1864, and four years later was appointed editor-in-chief of that paper, and served in this place till his death. He was the first to advocate the use of illustrations in the Church press. He was a member of six general conferences, and of the London Ecumenical Conference in 1881. He was also a member of the Baltimore Centennial Conference, and for ten years served as secretary of the Detroit Conference.

Ellicott, Henry J., sculptor, born near Ellicott City, Md., in 1848; died in Washington, D. C., Feb. 11, 1901. He was a great-grandson of Major Andrew Ellicott, who assisted Daniel H. Johnson in laying out the city of Washington. Mr. Ellicott received his early education in Washington, and then studied in the Academy of Design, New York city. Among his first works of prominence were the bronze statues for the monuments of the 1st and 2d Pennsylvania Volunteers on the battle-field of Gettysburg. The equestrian statues of Gen. Hancock, in Washington, and of Gen. McClellan, in Philadelphia, are probably his best-known productions. He also made busts of many well-known Americans, among others one of the late Zebulon B. Vance, for the State Capitol in Raleigh, N. C.

Emery, John James, local character, born in Fairfield, Me., Aug. 28, 1806; died in Roxbury, Mass., Oct. 4, 1901. He was one of fifteen children, was educated in the common schools, and studied surveying. He was an extensive farmer, and also carried on a large lumbering business. He was a selectman and county surveyor, and represented his town in the Legislature. In 1870 he removed to Turners Falls, Mass., to engage in business, and in later years had resided in Dorchester and Boston. In 1839 he was the innocent cause of what is known as the Aroostook War. During the boundary dispute with Canada he was sent to look over the ground and make a report upon it. While doing this he was captured by British soldiers and taken into Canada. When the affair became known there was great excitement, and immediate talk of war. The State troops were ordered out under the direction of the President, and sent to the boundary to secure his release. The Canadian Government released him before the Maine troops reached the scene, but at the same time assembled several regiments of troops on the border. President Van Buren sent Gen. Scott to take command, and he remained in the field till the trouble was over.

Esher, John Jacob, bishop of the Evangelical Church, born in Strasburg, Alsace, Dec. 11, 1823; died in Chicago, Ill., April 16, 1901. His family brought him to the United States when he was seven years old, and settled near Warren, Pa. In 1836 they removed to Illinois, settling on the banks of Des Plaines river, about 20 miles northwest of Chicago. Bishop Esher was licensed to preach at the first session of the Illinois Conference of the Evangelical Church, held in his father's house in 1845. After preaching one year in Illinois, one year in Iowa, and two years in Milwaukee, he was elected presiding elder of the Wisconsin district. At the close of his term the district was made the Wisconsin Conference, and he was stationed as missionary in Chicago and elected presiding elder of the Chicago district. Afterward, at Plainfield, Ill., he aided in the establishment of Northwestern College, assisted in its removal to Naperville, Ill., and as general solicitor laid the foundation of its endowment fund. For a time he served as editor of the Sunday-school literature of his Church, in Cleveland, Ohio, and at the same time he was editor of the *Christliche Botschafter*, and he was the first editor of the *Evangelical Magazine*. At the General Conference of 1863, held in Buffalo, N. Y., he was elected a bishop, and he was reelected for ten successive terms, serving till his death. From the time of his elevation to the bishopric his life was largely the history of the Church. He visited Germany in 1864 and again in 1900, and in February, 1865, organized the Germany Conference in Stuttgart. In 1884-'85 he visited Japan to re-

organize the mission work in that country, and, continuing the journey round the world, visited many mission fields. He recounted the story of his travels in his book *Über Länder und Meere*. In 1892 he again visited Japan, and organized the Japan Annual Conference. At the General Conference in 1895 he was appointed to write a systematic theology for official use in the Church, and he completed the manuscript only a few weeks before his death. About twenty years previously he prepared the catechism, which is the manual of doctrine in present use.

Evarts, William Maxwell, lawyer and statesman, born in Boston, Mass., Feb. 6, 1818; died in New York city, Feb. 28, 1901. He received his early education in the Boston Latin School, and was graduated at Yale College in 1837. He continued his studies at Harvard Law School, and

was admitted to the bar in New York in 1841. He immediately began practise in New York city, and soon established a reputation for learning and acumen, and was often consulted by older lawyers. In 1849 he was appointed assistant district attorney, serving till 1853; while holding this office in 1851 he successfully conducted

ed the prosecution of the Cuban filibusters concerned in the Cleopatra expedition. The same year he was selected to argue in favor of the constitutionality of the metropolitan police act. He was retained as counsel by the State of New York in 1857 and 1860 to argue the Lemmon slave case before the Supreme Court and Court of Appeals. He identified himself with the Republican party, and in 1860 was chairman of the New York delegation to the National Convention in Chicago, where he delivered an address in placing the name of William H. Seward before the convention. In 1861 he was a candidate before the New York Legislature for the United States senatorship, but his name was withdrawn to enable his supporters to secure the election of Ira Harris. He then retired for several years from political life. In 1862 he conducted the case of the Government to establish in the Supreme Court the right of the United States in the civil war to treat captured vessels as maritime prizes. In 1865-'66 he maintained with success before the courts the unconstitutionality of State laws taxing United States bonds or national bank stock without the authorization of Congress. In 1868 he made a famous three-day argument before the United States Senate sitting as a court of impeachment, which resulted directly in the acquittal of President Johnson; from July 15, 1868, till the end of Johnson's administration, he was Attorney-General of the United States. In 1872 he was counsel for the United States before the Geneva Board of Arbitration, and his argument was potent in effecting a peaceful and honorable adjustment of the claims of direct damage against Great Britain for the devastations of the Alabama. In 1875 he was senior counsel for Henry Ward Beecher in the trial of the suit against him in Brooklyn. In 1877 he was the advocate of the Republican party before the electoral commission, and he became Secretary of State in the Cabinet of President Hayes. He was sent to Paris in 1881 as a delegate to the Inter-

national Monetary Conference. He was elected United States Senator from New York and served from March 4, 1885, till March 3, 1891. Soon after his seventy-fifth birthday he began to withdraw from public life, mainly on account of the failure of his eyesight. Mr. Evarts was known as a brilliant speaker at convivial gatherings and as an eloquent public orator; as an advocate he was without a superior in his time. On many important occasions he delivered addresses, several of which have been published, among them a eulogy on Chief-Justice Chase, delivered at Dartmouth College in June, 1873; the Centennial oration, in Philadelphia, in 1876; and speeches at the unveiling of the statues of William H. Seward and Daniel Webster, in New York, and of Bartholdi's Statue of Liberty. He received the degree of LL.D. from Union College in 1857, from Yale in 1865, and from Harvard in 1869.

Fee, John G., clergyman, born in Bracken County, Kentucky, Sept. 9, 1816; died in Berea, Ky., Jan. 11, 1901. He was the first son of a thrifty farmer, John Fee, who had inherited one slave and bought others. At the age of sixteen young Fee united with the Presbyterian Church, and two years later entered Augusta College, where he was finally graduated, although in the meantime he had studied at Miami University, Oxford, Ohio. He entered Lane Seminary, Cincinnati, in 1842, and there he became an ardent abolitionist. On returning home in 1844, he incurred the lasting anger of his father, who disinherited him when it was discovered that young Fee had sold all his possessions, and with the proceeds bought one of his father's slaves and set her free. The young preacher then married Matilda Hamilton, removed to Lewis County, and there began evangelistic work. The Synod of Kentucky, meeting at Paris, Ky., in 1845, censured him for not giving fellowship in his church to slaveholders, and requested the American Mission Society to give him no more aid as an evangelist. But Fee persisted in his work, gathering his little antislavery congregations in Lewis and Bracken Counties, suffering all sorts of indignities, and often meeting with mob violence. His life was constantly threatened. Once, while sitting in the door of his house, he was fired on. Once an assistant was flogged before his eyes, and he was threatened. While he was preaching at College Hill, a mob of 60 men surrounded the house with pistols and guns. Fee was dragged out, and a man with a rope swore that he would be swung up if he did not leave the county. He declined to do so, and went on preaching, unarmed and unafraid. In 1848 the American Missionary Association came to his aid with an allowance of \$200 a year, and his tracts against slaveholding were widely circulated in Kentucky and other States. His little book, *Antislavery Manual*, attracted the notice of Cassius M. Clay, who not long before had bought a large tract of land in the Kentucky mountains with the intention of keeping it forever free from slavery. In 1853 Gen. Clay asked Dr. Fee to accept a small farm on this tract, settle upon it, and become pastor of the district. The farm was but a clearing in the wilderness, but there Dr. Fee, with the help of faithful assistants, founded and built Berea College, open to all without regard to sex or color, which now has more than 600 students. Dr. Fee remained at its head till about 1869. Mobs repeatedly threatened to extinguish it, and twice the members of the little colony were driven from their homes; but they went back again and stayed, and the work of their hands prospered. Dr. Fee and his friends

also built schoolhouses in Pulaski and Rockcastle Counties, Kentucky. Some of these buildings were burned by mobs, and often the schools were broken up by violence. He lived to enjoy the respect and reverence of the men who were his bitterest opposers, many of whom since the war have moved to Berea to educate their children. Dr. Fee, in his Autobiography, has vividly told of his early struggles.

Fisher, William Alexander, jurist, born in Baltimore, Md., Jan. 8, 1837; died there, Sept. 26, 1901. He was graduated at Princeton in 1855, and in 1858 was admitted to the bar in his native city. He achieved a national reputation as a lawyer, and became a leader of the conservative element of the Democratic party in his State. He was elected to the State Senate in 1879. In 1882, in the attempt to reform the judiciary, he was elected to the Supreme bench of Baltimore on the tickets of the regular Democratic party and of the Independent Republicans and Democrats.

Fisk, Franklin W., clergyman and educator, born in Hopkinton, Vt., in 1820; died in Chicago, Ill., July 4, 1901. He was graduated at Yale in 1849, and after teaching for a short time there he accepted the chair of Sacred Rhetoric in the seminary at Beloit, Wis. Oct. 6, 1858, he was called to a similar place in Chicago Theological Seminary, then organizing. He held this professorship till 1900, and was president of the institution for the last thirteen years of its incumbency. Upon his resignation he was made professor emeritus. He was one of the best known theologians and educators in the West.

Fiske, John, author, born in Hartford, Conn., March 30, 1842; died in Cambridge, Mass., July 4, 1901. He was the only child of Edmund Brewster Green, of Smyrna, Del., and Mary Fiske Bound, of Middletown, Conn. The father edited newspapers in Hartford, New York, and Panama, where he died in 1852. His widow married Edwin W. Stoughton, of New York, in 1855. The son's name was originally Edmund Fiske Green; in 1855 he took the name of his maternal great-grandfather, John Fiske. He lived in Middletown, Conn., during his childhood, and was graduated at Harvard in 1863, and at Harvard Law School in 1865, having been already admitted to the bar in 1864, but he never practised law to any extent. He delivered a course of lectures on Positive Philosophy at Harvard in 1869, and in the following year he was an instructor in that institution. From 1872 to 1879 he was assistant librarian, and after his resignation he was made a member of the Board of Overseers of the university. After 1881 he lectured annually on American history at Washington University, St. Louis, Mo., and after 1884 held a non-resident professorship of American History in that institution. He lectured on American history at University College, London, in 1879, and at the Royal Institution of Great Britain in 1880, and after 1871 he delivered hundreds of lectures, chiefly upon American history, in the United States and Great Britain. His inquiries into the philosophy of human progress led him to a careful study of the doctrine of evolution, and it was as an expounder of that doctrine that he was first known to the public. His career as an author began in 1861, with an article on Mr. Buckle's Fallacies, published in the National Quarterly Review. He was afterward a frequent contributor to periodicals. His published works are *Myths and Mythmakers* (1872); *Outlines of Cosmic Philosophy* (2 vols., 1874); *The Unseen World* (1876); *Darwinism and Other Essays*

(1879); *Excursions of an Evolutionist* (1883); *The Destiny of Man* (1884); *The Image of God* (1885); *American Political History*; *The Critical Period of American History*; *The War of Independence* (1889); *The Discovery of America* (2 vols., 1891); *The History of the United States for Schools* (1891); *Edward Livingston Youmans* (1894); *Virginia and her Neighbors* (2 vols., 1897; illustrated edition, 1901); *The Critical Period* (1897); *The Dutch and Quaker Colonies in America* (2 vols., 1899); *Through Nature to God* (1899); *A Century of Science* (1900); *The Mississippi Valley in the Civil War* (1900). He edited, with James Grant Wilson, Appletons' *Cyclopædia of American Biography*.

Fitz, E. B., actor, died in Chicago, Feb. 14, 1901. He made his first appearance in 1871 in the war drama entitled *Home and Country*, afterward playing with small companies in the United States until 1879, when he joined the Barlow, Wilson, Primrose and West Minstrels, and appeared with that company for several years in all parts of the country. At the conclusion of this engagement he entered the vaudeville field, with his wife, Kathryn Webster, where he soon won a prominent place, making musical sketches his specialty. After considerable experience in this work, Mr. Fitz became associated at different periods, with Hallen and Hart, Rich and Harris, Ezra Kendall, and the Two Johns Company. In 1890, in partnership with the late Dan Shelby, he produced *A Breezy Time*, a successful farce-comedy. After the first season with this piece, Mr. Fitz assumed sole control of it, and at the time of his death three traveling companies were playing it under his management.

Flohr, William Henry, theatrical manager, born in Halifax, Nova Scotia, in 1836; died in New York city, Jan. 4, 1901. In early boyhood he removed with his parents to Boston, and at the age of seventeen obtained a place as flyman in the Boston Theater. After serving a long apprenticeship in the mechanical department of that house he became assistant to W. H. Curtis, an old actor, in the costuming business. In 1869 he was engaged by Edwin Booth as his assistant stage-manager and master of wardrobe, and he remained Mr. Booth's most trusted lieutenant nearly twenty-four years. He knew the lines and business of all the plays in that tragedian's repertoire, rehearsed the various stock companies with which Mr. Booth appeared, and was in full charge of the minor details of every production. On Oct. 12, 1872, at the Lyceum Theater, Lewiston, Me., where the company was engaged to open the new house, Mr. Flohr was badly burned in putting out a fire that was discovered under the stage just as the performance was beginning. For this service, which averted a fearful catastrophe, he received a handsome reward. In the intervals caused by Mr. Booth's absence on his European tours Mr. Flohr managed companies in Philadelphia, and in 1876 he accompanied Lawrence Barrett on a tour to the Pacific coast. After leaving Mr. Booth, Mr. Flohr was stage-manager of the Park Theater and the Grand Opera-House, and later superintendent of the new American Theater, all in New York city.

Ford, Albert Matthew, tide calculator, born in Philadelphia, Pa., Dec. 6, 1841; died in Salem, N. J., Nov. 11, 1901. He was educated by private tutors, and later at the Hill School, Pottstown, Pa. He early devoted much time to mathe-

matics and navigation, which in later years took the practical form of observations of the tides that made Salem the tidal center of Delaware Bay. He was also fond of languages, and at his death fluently spoke Spanish, French, German, and Swedish, and in collaboration with a Swedish gentleman he wrote and published (1872) a Swedish and English word-book. After leaving school he was a post-office clerk, a railroad clerk, and a reporter. He afterward went to Salem, N. J., where he devoted the remainder of his life to study of the tides. He issued each month, at his own expense, tide cards for Delaware river and bay and for the Atlantic coast of New Jersey. These were always in demand.

Fraley, Frederick, banker, born in Philadelphia, Pa., May 28, 1804; died there, Sept. 23, 1901. He studied law, but entered early into the hardware business, and never practised. He was president of the Western Savings Fund Society, and was associated executively with many of Philadelphia's great financial institutions. He was one of the founders of the Franklin Institute, in 1824, and for many years its treasurer; one of the original incorporators of the Philadelphia Board of Trade, and its president after 1894; president of the National Board of Trade from its foundation, in 1868, until 1900; and one of the organizers of the Centennial Exhibition in 1876. He served as president of the American Philosophical Society after 1880; was one of the original trustees of Girard College, 1847; one of the founders of the Union League; and a trustee of the University of Pennsylvania after 1853. He was a member of the Philadelphia city council in 1834, a State Senator in 1837, and a delegate to the national convention that nominated William Henry Harrison for the presidency.

Frazar, Everett, Korean consul-general in the United States, born in Duxbury, Mass., Oct. 4, 1834; died in Orange, N. J., Jan. 3, 1901. In 1858 he sailed from Boston for Shanghai, China, and there established the firm of Frazar & Co., which is still in existence. Branches were opened in Nagasaki, Japan, in 1860; in Hong-Kong, in 1875; and in Yokohama, in 1878. The firm originally dealt in silks, straw, tea, petroleum, and cotton goods, but in late years has devoted its attention to the introducing of electric lighting into Japan and China. Mr. Frazar was appointed by the King of Korea as consul-general in the United States, the exequatur, issued by President Arthur, bearing the date of April 3, 1884. In 1886 he concluded arrangements with the Canadian Pacific Railway for the opening up of the new Canadian Pacific route with China and Japan under the management of his company. In September, 1888, Mr. Frazar received from the King special marks of recognition for services rendered to Korea. Gold and jade decorations were sent to him, and with them a special decree conveying the honorary title of Ka-Sun-Tai-Poo, Korean nobleman of the second rank. After 1872 he was the resident partner of Frazar & Co. in New York city. He was president of the American-Asiatic Society.

French, John William, soldier, born in Washington, D. C., June 2, 1843; died at Fort McPherson, Ga., Nov. 11, 1901. He enlisted, April 17, 1861, as a private in the 7th New York Infantry. He was discharged from the volunteer service June 3, 1861, and on Oct. 24 was appointed 2d lieutenant in the 8th Regular Infantry, and in that capacity served through the war. He was twice brevetted—1st lieutenant, Aug. 19, 1864, for gallant and meritorious services in the fight for the Weldon Railroad, and captain,

Oct. 28, 1864, for gallant and meritorious services in the battle of Hatcher's Run. He was commissioned 1st lieutenant in the 8th Regular Infantry, Jan. 9, 1866, and captain in the 40th Infantry, July 28 of the same year. He was transferred to the 25th Infantry, April 20, 1869. He received his commission as major of the 14th Infantry, Nov. 1, 1891, and as lieutenant-colonel of the 23d Infantry, July 5, 1895. He served with his regiment during the Spanish-American War and in the Philippines, and on the death of Col. Egbert became colonel of the 22d Infantry, March 26, 1899. In March, 1900, he was detailed as commanding officer of Fort McPherson, Ga., and while there he organized seven companies of the 27th Infantry garrisoning the post.

Fry, Charles Carleton, soldier, born in Lynn, Mass., in May, 1842; died there, March 21, 1901. He received a common-school education, and went into the shoe business, and for many years was a manufacturer. In 1875 he was elected city auditor, and in 1876 and 1877 he was city marshal. In 1880 he became clerk and treasurer of the Lynn Gas Company, and after its reorganization and incorporation as the Lynn Gas and Electric Company he was continued in his former offices with the added duties of general manager. For several years he served in the Lynn Common Council, and a part of the time was president of that body. During this time he was also a member of the school board. From Sept. 15, 1862, till Aug. 7, 1863, he served in the 8th Massachusetts Volunteers, and he became 1st lieutenant, Jan. 27, 1865. He served in this capacity till appointed quartermaster of the 8th Regiment, July 21, 1874, and on Aug. 3, 1874, he was made adjutant, and served till he was discharged, April 26, 1876. He was made assistant adjutant-general, with the rank of lieutenant-colonel, March 4, 1882, and upon his retirement, in July, 1897, was made a brigadier-general on the retired list.

Fuller, Thomas C., jurist, born in North Carolina in 1831; died in Raleigh, N. C., Oct. 20, 1901. He was a member of the Confederate Congress, and was elected to the United States House of Representatives immediately after the civil war, but was not seated. He was an able lawyer, and was appointed, June 10, 1891, Associate Justice of the United States Court of Private Land Claims, upon the recommendation of both the Republicans and Democrats of his native State. He served in this office till his death.

Fulton, Justin Dewey, clergyman, born in Sherburne, N. Y., March 1, 1828; died in Somerville, Mass., April 16, 1901. His father was a Baptist preacher of Irish descent, who removed to Brooklyn, Mich., in 1836. There the son received his early education at an academy, and in 1847 he entered the University of Michigan. In his senior year he entered the University of Rochester, where he was graduated in 1851. He then studied at the Theological Seminary, after which he took charge of a Bible Union paper in St. Louis. The paper was highly successful, but Mr. Fulton's hostility to slavery roused bitter opposition. In May, 1854, he was ordained and installed as pastor of the Tabernacle Baptist Church, where he delivered the first Free State sermon in St. Louis. The church and paper both grew rapidly, but in May, 1855, the stockholders of the Gospel Banner resolved that the editor must believe in and uphold slavery, and Mr. Fulton resigned. He afterward accepted a call to a church in Sandusky, Ohio, which increased under his leadership, while he was the means of reviving six churches in the Huron Association.

In 1859 he became pastor of the Tabernacle Church, Albany, N. Y., and in December, 1863, took charge of Tremont Temple congregation, Boston, where he remained ten years, and won his rank among the foremost pulpit orators. When he assumed this pastorate there were only 50 members, but during his charge the membership increased to 1,000, and the income to more than \$23,000. In 1873 Dr. Fulton was called to Hanson Place Baptist Church, Brooklyn, N. Y., which he left in 1875 for the Clinton Avenue Chapel, where in December of the same year the Centennial Baptist Church was organized. In September, 1879, the Clermont Avenue Rink was occupied by the church as a place of worship. In November, 1894, he became pastor of the First Baptist Church of Somerville, Mass., where the remainder of his life was spent. He retired from active duty in 1897. He was a popular lecturer. While in St. Louis he published his *Roman Catholic Element in American History*. At one time his lectures became so virulent that it became difficult for him to secure a hall. One of his books on the priesthood was confiscated by Anthony Comstock, and in 1879 he was suspended by the Baptist Preachers' Association of New York, but he was reinstated. His books and published lectures include *Why Priests should Wed*; *How to Win Romanists*; *Washington in the Lap of Rome*; *The Fight with Rome*; *Sam Hobart, the Railroad Engineer*; *Spurgeon our Ally*; *Timothy Gilbert*; *Cornelia Harmon, or the Way Out*; *The True Woman*; *Rome in America*; and *Witnessing for the Truth*. In 1875 he made an extended trip through the South, lecturing upon *The American of the Future*: Shall he be a Partisan or a Patriot?

Gardner, Anna, abolitionist, born in Nantucket, Mass., Jan. 25, 1816; died there, February, 1901. She was of Quaker ancestry. When a girl she read the *Liberator* and became interested in the antislavery cause. In 1841 she published the call for the first antislavery meeting in Nantucket, at which Frederick Douglass made his first public speech and electrified his audience. She delivered many lectures during the years immediately preceding the civil war, and after the war she taught in freedmen's schools in Virginia and North and South Carolina. In 1878 she returned to New York city, where soon afterward she was severely injured in a carriage accident. After many weeks of suffering and a partial recovery, she returned to her old home in Nantucket. She lectured several times before the Nantucket Athenæum. She was a fluent writer, and in 1881 she published her best work in a volume of prose and verse entitled *Harvest Gleamings*.

Gardner, William Montgomery, soldier, born in Augusta, Ga., in 1823; died in Memphis, Tenn., June 16, 1901. He was graduated at West Point in 1846. As a lieutenant, in the battle of Contreras, Mexico, Aug. 26, 1847, he won distinction by storming a battery with a single platoon of American soldiers and taking the guns. At the outbreak of the civil war he became colonel of the 8th Georgia Regiment.

Gemünder, Otto, violin-maker, born in New York city, Aug. 10, 1871; died there, June 10, 1901. He was the youngest of the three sons of the late George Gemünder, the famous maker of violins, who followed their father's business, and he showed great promise in his chosen art. During the last ten years of his life the father did no active work himself, but bent every effort to instilling into his sons the love for his art and the cunning of his hand in the fashioning of violins.

Getchell, Emily Adams, born in Newbury (now a part of New Bedford), Mass., Feb. 7, 1850; died there, July 2, 1901. She began to write when a child, and when she was eighteen years old her first poems appeared in a local paper. She also composed the music for many of her poems. She was well known throughout New England for her active interest in charities and in literary research. For several years she has been secretary of the Old Newbury Historical Society and of the General Charitable Society of Newburyport. The organization of the National Association of the Pillsbury Family was brought about chiefly through her efforts, and in 1898 she published the *History of the Pillsbury Family in America*.

Getty, George Washington, soldier, born in Georgetown, D. C., Oct. 2, 1819; died in Forest Glen, Md., Oct. 2, 1901. He was graduated at West Point in 1840, and entered the service as a 2d lieutenant, 4th Artillery. He was made a 1st lieutenant, Oct. 31, 1845; a captain, Nov. 4, 1853; transferred to 5th Artillery, May 14, 1861; commissioned major, Aug. 1, 1863; colonel, 37th Infantry, July 28, 1866; transferred to 3d Infantry, March 15, 1869; transferred to 3d Artillery, Jan. 1, 1871; transferred to 4th Artillery, July 17, 1882. Col. Getty served in the Mexican War, and Aug. 20, 1847, he was brevetted captain for gallant and meritorious services at Contreras and Churubusco. In the civil war he served in the Army of the Potomac. He was commissioned lieutenant-colonel of volunteers, Sept. 28, 1861; he served as aide-de-camp during the Peninsular campaign, and was made brigadier-general of volunteers, Sept. 25, 1862. He was severely wounded in the battle of the Wilderness, but recovered sufficiently to join his command before Petersburg. For gallant and meritorious services in various battles of the civil war he received the following brevet commissions: Lieutenant-colonel, April 19, 1863; colonel, May 5, 1864; brigadier-general and major-general, March 13, 1865; and major-general of volunteers, Aug. 1, 1864. He was honorably mustered out of the volunteer service, Oct. 9, 1866. On April 3, 1867, he was placed in command of the district of New Mexico. He commanded the troops along the Baltimore and Ohio Railroad during the riots of 1877. He was retired Oct. 2, 1883.

Gihon, Albert Leary, medical director United States navy, born in Philadelphia, Pa., Sept. 28, 1833; died in New York city, Nov. 17, 1901. He was educated in the Philadelphia High School, receiving the degree of A. B. in 1850; of M. D., from the College of Medicine and Surgery, in 1852; and of A. M., from Princeton, in 1884. He was Professor of Chemistry and Toxicology in the Philadelphia College of Medicine and Surgery in 1853 and 1854, and entered the navy as assistant surgeon, May 1, 1855. He was assigned to the sloop-of-war *Portsmouth*, and was present in November, 1856, at the battle that resulted in the taking of the Barrier forts at Canton, China. He served on the Paraguay expedition in 1858 and 1859, and in 1860 he was sent to the Brooklyn Naval Hospital, where he remained a year. He was in the brig *Perry*, cruising off the coast of the Southern States, when the Confederate privateer *Savannah* was captured. From 1862 to 1865 he was on the *St. Louis*, and after the war was sent to the Portsmouth yard as senior medical officer. He was on board the *Idaho* when that ship was wrecked in the typhoon of Sept. 21, 1869, and for services in the Portuguese colony at Dilly, on the island of Timor, and to the Portuguese men-of-war *Principe Dom Carlos* and *Sa*

da Bandeira, he received from the King of Portugal, with the consent of Congress, the decoration of Knight of the Military Order of Christ. For services to the British men-of-war *Flint* and *Dawn* he received the thanks of the British Government, and for similar services to the French gunboat *Scorpion* those of the commander-in-chief of the French East India station. After special duty in Brooklyn in 1870 he was attached to the Marine Rendezvous in Philadelphia, and was a member of examining boards. Three years later he was surgeon of the fleet on the European station. He designed and superintended the construction of the model hospital ship for the Centennial Exposition of 1876, and at that exhibition presented his ambulance cot, which was adopted for use in the navy. He was made a medical director in 1879, and was afterward on duty in Norfolk, Va., Washington, D. C., Mare Island, Cal., Brooklyn, and New York. May 1, 1895, as senior medical director, he was transferred to Washington, to take charge of the medical headquarters. He was retired, Sept. 28, 1895, with the rank of commodore. He was author of *Practical Suggestions in Naval Hygiene* (1871); *Public Health* (papers and reports of the American Public Health Association, 1877 to 1898); *Naval Hygiene* and other papers in *Wood's Handbook of the Medical Sciences* (1885); and *Demography*, in *Annual of the Universal Medical Sciences* (1885).

Gillespie, Elizabeth Duane, philanthropist, born in Philadelphia, Pa., Jan. 15, 1821; died there, Oct. 13, 1901. She was a great-granddaughter of Benjamin Franklin, and at her death was his oldest descendant. Her father, William Duane, in 1805 married Deborah Bache, a granddaughter of Franklin. Elizabeth Duane married, in 1849, Lieut. Gillespie, of the United States Marine Corps, who died in 1859. At the outbreak of the civil war she was placed in charge of the hospital for wounded soldiers, and later she became interested in the Women's Sanitary Fair, held in Logan Square, Philadelphia. She was a member of the women's committee appointed to cooperate with the Board of Finance in securing money for the Centennial Exposition in 1876, and she not only secured a large amount for the exposition itself, but was instrumental in erecting and furnishing the Women's Building. In 1877 Mrs. Gillespie went to Europe, where for four years she interested herself in the giving of entertainments to the deserving poor. Upon her return to the United States she took a leading part in organizing the Colonial Dames and other patriotic societies. She was also an active worker in many charitable organizations. In 1890 litigation was begun simultaneously in Philadelphia and Boston to set aside some of the trusts provided for in the will of Benjamin Franklin. Mrs. Gillespie was appointed administrator of the Franklin residuary estate with the will annexed, and the litigation was prosecuted until April, 1895, when Judge Arnold, by sustaining a demurrer of the defendants (the city of Philadelphia and the Board of City Trusts), put an end to it. She published *A Book of Remembrance*.

Gleason, Elliott Perry, inventor and manufacturer, born in Westmoreland, N. H., June 27, 1821; died in New York city, Sept. 26, 1901. At the age of fifteen he removed to Boston, and later to Providence, where in 1851 he went into business, under the firm name of Mooney & Gleason, in the manufacture of gas-burners and supplies. He invented the regulating Argand gas-burner, the two-hole or fish-tail gas-burner tip, and many other devices, and was identified with the devel-

opment of electric lighting. In 1861 he removed his business to New York, where in 1871 he incorporated the E. P. Gleason Manufacturing Company, of which he was president and principal owner. He also owned the Gleason Knitting and Manufacturing Company, and was the principal owner of the Gleason & Bailey Company, manufacturers of fire-department apparatus—both in Seneca Falls, N. Y., where he was known as "the working man's friend." He was president of the Gleason-Peters Air-Pump Company, the Lawler Water-Feed and Damper-Regulator Company, and the Steam-Boiler Equipment Company, of New York, and he conducted in Brooklyn the manufacture of glassware for illuminating.

Gobrecht, William H., surgeon, born in Philadelphia, Pa., March 7, 1828; died in Washington, D. C., July 19, 1901. He was graduated at the Pennsylvania Medical College, March 7, 1849, and soon afterward he was appointed demonstrator of anatomy there, where he served until he was made Professor of Anatomy in the Philadelphia College of Medicine, from which he was transferred to the professorship of Anatomy in the Pennsylvania Medical College. He filled this chair till the outbreak of the civil war, when he entered the National army as surgeon of the 49th Pennsylvania Volunteers, in August, 1861. Early in 1863 he was appointed surgeon United States Volunteers, and detailed on the board to examine applicants for appointment as surgeons. While on this duty he was successively surgeon in charge of Seminary United States General Hospital, at Covington, Ky., and West End United States General Hospital, Cincinnati, Ohio; subsequently organized and was appointed surgeon in charge and treasurer of the Military Hospital for Officers at the same place. He was subsequently post surgeon at Camp Dennison, Ohio, then post surgeon at Johnson's island. In the early part of 1866 he was honorably discharged with the brevet rank of lieutenant-colonel for faithful and meritorious services. Before the close of the war he was appointed Professor of Anatomy in the Medical College of Ohio, Cincinnati, which chair he held about ten years. After several years he accepted the chair of Anatomy in Fort Wayne Medical College and Fort Wayne College of Medicine, remaining there four years. He was then appointed in September, 1882, qualified surgeon in the Bureau of Pensions at Washington, D. C. Dr. Gobrecht edited Allen's *Dissector's Guide*, Wilson's *System of Human Anatomy*, Curling on *Disease of the Testis*, Miller's *Obstetrics*, and Eve's *Remarkable Cases in Surgery*. He was a member of the National Academy of Sciences.

Gorham, Charles T., banker, born in Danbury, Conn., May 29, 1812; died in Marshall, Mich., March 11, 1901. He went to Michigan in 1836, and in 1840 engaged in banking, which he conducted till 1865. In that year he organized the First National Bank of Marshall, and he continued at its head till his retirement in January, 1898. In the early days he was a Democrat, but upon the organization of the Republican party he identified himself with it. He was well known as a friend of the slaves, and assisted many of them to escape. In 1858 he was major-general of the Michigan State Militia, and the following year he served in the State Senate. He also served as minister to The Hague during President Grant's first term, resigning to return to look after his business affairs, and as Assistant Secretary of the Interior during the term of President Hayes.

Graham, Robert, educator, born in Liverpool, England, Aug. 14, 1822; died in Pittsburg, Pa., Jan. 20, 1901. He was brought to the United States when a boy, and united first with the Methodist Church in Pittsburg, and afterward with the Disciples or Christian denomination, founded by Alexander Campbell. While working at his apprenticeship as carpenter he devoted his leisure time to study, and so soon as he became of age he entered Bethany College, West Virginia, of which Alexander Campbell was then president. He was graduated in 1847, and made a tour of the Southern States in the interest of the college. He settled as pastor in Fayetteville, Ark., in 1848, and there founded Arkansas College, and was its president from 1850 till 1859. He was then elected to the chair of English History and Literature in Kentucky University, Lexington. During the war he went to Cincinnati, and was pastor of a Christian church there till 1864, when he went to San Francisco and founded a church of his denomination. In 1866 he was elected president of the College of Arts of Kentucky University. He was at the head of this and afterward of the Bible College of the same institution, save for six years, when he was president of the Hamilton Female College, in the same city, till June, 1898.

Gray, Elisha, inventor, born in Barnesville, Ohio, Aug. 2, 1835; died in Newtonville, Mass., Jan. 21, 1901. As a boy he worked at blacksmithing, carpentry, and boat-building. At the age of twenty-one he entered Oberlin College, where he studied five years, devoting his time to the physical sciences, and making much of the apparatus used in class-room experimentation. In October, 1867, he obtained a patent for an automatic self-adjusting telegraph relay, the first of a long series covering his many inventions, chiefly in connection with the development of the telegraph and the telephone. He established himself as a manufacturer of electrical apparatus in Cleveland in 1869, and in 1872 organized the Western Electric Manufacturing Company, from which he retired in 1874 to go to Europe to perfect himself in the study of acoustics. He was for many years electrician to the Western Electric Manufacturing Company, and later he established the Gray Electric Company at Highland Park, Ill. He was the organizer and chairman of the Congress of Electricians held in Chicago in 1893. Prof. Gray invented a telegraphic repeater, a telegraphic switch, an annunciator for hotels, and a type-printing telegraph. In 1877 he received patents for a multiplex telegraph. His system is "based upon the ability to transmit a number of tones simultaneously over the same wire, and analyze them at the receiving end, so that each tone will be audible on a particular instrument which is tuned to it, but no other." He succeeded in sending 8 messages in this way over one wire. In 1893 he patented his telautograph, for transmitting writing or sketches. At his death he was experimenting upon a system of underwater fog-signals, using the sea as the connecting medium; and he had succeeded in transmitting signals by a bell, rung electrically under water, more than 12 miles. However, Prof. Gray's fame rests upon his early experimentation with, and his claim to, the discovery of the telephone. He found, when an end of a secondary coil was connected with the zinc lining of a dry bath-tub, that when he held the other end of the coil in his left hand, and touched the lining of the tub with his right hand, it would glide along the side for a short distance in making contact, giving rise to a sound that had the same pitch

and quality as that of a human voice, and contact-breaker. After further experiments he filed a caveat in Washington, D. C., in 1876, and the expectation of perfecting the system of the vocal sounds telegraphically. He obtained a broad patent for speaking-telegraph, including some of Prof. Gray's ideas, in 1876, and Prof. A. Graham Bell. Both men were in the invention, and after twenty years of litigation the courts awarded the credit to Bell, and in the opinion of many Prof. Gray was deprived of the rightful credit for a great invention. Sensational disclosures were made through affidavits of a patent-examiner named Wilbur, which convinced Prof. Gray that his caveat in the Patent Office had been revealed to the Bell people, and that they were thus enabled to make the instruments for which they received their patents. Prof. Gray was not able to put in any legal claim for rights himself because his patent rights were merged with the Bell patents by a deal between the Western Union Telegraph Company, which controlled the Gray patents, and the Bell company. By this merger the Western Union company received a yearly royalty of several hundred thousand dollars for staying out of the telephone field. Of this money Prof. Gray got but a small share. A further claim for \$12,000,000 was decided against the Western Union company by the courts in 1900, and this gave to Bell practically the credit for priority. Prof. Gray died poor. He had received comparatively large sums from time to time from his inventions, but he invariably used the money in expensive experiments toward new discoveries. He published *Experimental Researches in Electro-Harmonic Telegraphy and Telephony*, and *Elementary Talks on Science*.

Gray, William Cunningham, editor, born in Butler County, Ohio, Oct. 17, 1830; died in Oak Park, Ill., Sept. 29, 1901. His boyhood was spent in farm work, and his youth in teaching. While working in the woods at night, caring for the sugar-kettles, he wrote for his own amusement on pieces of shingle. Some of these writings found their way into the village newspaper, and this encouraged him to make an effort for a higher education. He secured admission to Gen. Samuel Cary's Academy at College Hill, near Cincinnati, in 1841, was graduated at Belmont College in 1849, and was admitted to the bar in 1852, but never practised. He became editor of the *Miami Democrat* in 1852, was editor of the *Scott Battery*, for the campaign of 1852, and in 1853 established the *Tiffin (Ohio) Tribune*. After one year as editorial writer on the *Cleveland Herald*, he became, in 1863, editor of the *Newark American*, continuing at its head till 1871, when he became editor of *The Interior*, Chicago, in which his *Camp-fire Musings* and editorials were widely read. He received the degree of Ph. D. from Wooster University, and that of LL. D. from Knox College. He was the author of *Camp-fire Musings* and *Clear Creek*.

Green, Lillian, singer, born in New York city, in 1876; died there, July 20, 1901. She sang first in the chorus and later in the title rôle of *Little Christopher* at the Garden Theater, New York. After a wide experience in standard and comic opera with the Murray-Lane company, she left the operatic stage and appeared as Mrs. Bagot in the first presentation of *Tribby*. Later she sang with the Casino company and with the summer opera companies. Her last important impersonations were the leading rôle in *My Lady* at the Victoria Theater, New York, in 1900, and *Viola in King Dodo*, in Chicago, in 1900-1901.

Greenough, James Bradstreet, educator, born in Portland, Me., May 4, 1833; died in Cambridge, Mass., Oct. 11, 1901. He was graduated at Harvard in 1836, studied at the Harvard Law School, and afterward went to Marshall, Mich., where he practised his profession till 1865, when he was appointed tutor in Latin in Harvard University. Eight years later he was made assistant professor, and in 1883 he became Professor of Latin, and he continued in that capacity till his resignation in April, 1901, on account of failing health. One of his greatest works was the establishing of the collegiate institution for women, at first unofficially called the Harvard Annex, now known as Radcliffe College. While the idea was his alone, he was assisted in organizing the movement by William W. Goodwin and Arthur Goodwin. Prof. Greenough was a member of its governing board from its foundation, and he was for many years its president. He was the first person to give instruction in Sanskrit, and to introduce it as a regular study in college courses. He was the author of a Latin grammar and of a series of classical text-books in collaboration with Joseph N. Allen. He published *Words and their Ways in English Speech*, in collaboration with Prof. George L. Kittredge (1901), and was the author of a *Special Vocabulary to Virgil and The Queen of Hearts, a Dramatic Fantasia*.

Gregory, Isaac M., humorist, born in Johnstown, N. Y., about 1836; died in New York city, March 5, 1901. He began his newspaper career on the *Fulton County Democrat*, and later was owner and editor of the *Mohawk Valley Democrat*, in Fonda, N. Y. He was connected at different times with the *Rochester Democrat and Chronicle*, the *Troy Whig*, and the *New York Graphic*. Mr. Gregory was editor of *Judge* from its foundation till his death. He was one of the old-time humorists, of whom Burdette, of the *Burlington Hawkeye*, and Bailey, of the *Danbury News*, were prominent examples.

Gregory, William, Governor of Rhode Island, born in Astoria, N. Y., Aug. 3, 1849; died in Wickford, R. I., Dec. 16, 1901. While he was a boy his parents removed to Westerly, R. I., where the son received a high-school education. When fifteen years old he entered a factory, and four years later became superintendent of a woolen mill at Auburn, R. I. He served in various mills till 1880, when he became general manager and agent for the A. T. Stewart Company in New York. Subsequently he returned to Rhode Island, and engaged in the manufacture of worsted goods in Wickford, in which business he continued till his death. He was president of the Wickford National Bank and chairman of the State Board of Charities and Correction. He represented North Kingston in the Legislature from 1888 to 1892; was State Senator, 1894 to 1898; was Lieutenant-Governor from 1898 till his inauguration as Governor in May, 1900. He was reelected in 1901 for the term beginning, by the new law, in January, 1902.

Griffiths, William N., actor, born in Brooklyn, in 1840; died in Washington, D. C., March 26, 1901. He removed to Baltimore in his youth, and there began his stage career shortly before the civil war. He played in old stock companies, including the old Forepaugh company of Philadelphia. He supported Lizzie Evans for three seasons, and later acted with Patti Rosa. In 1880 he played Sandy Liston, in *Christie Johnstone*, at the Windsor Theater, in support of Frank S. Chanfrau, and in the following year appeared with him in *Kit, the Arkansas Traveler*. In 1882 he played James Downey in *Chispa*, and in 1884

Dr. Valnois in *Outcast*. While playing with Patti Rosa in *Dolly Varden* in 1892-'93, Griffiths's acting attracted the attention of Richard Mansfield, who at once engaged him, and with whom he played almost without interruption till his death. With Mr. Mansfield he appeared as Montfleury in *Cyrano*, Mikola in *Rodion the Student*, William Dudgeon in *The Devil's Disciple*, Professor Sebastian in *The First Violin*, Pistol in *Henry V.*, and in many other parts.

Grissom, Arthur (Colfax), author and editor, born in Payson, Adams County, Ill., Jan. 21, 1869; died in New York city, Dec. 3, 1901. He was a son of the Rev. William Grissom, a minister of the Christian Church. He was graduated at Woodland College, Independence, Mo., in 1886. His first story was published when he was thirteen years old. He continued to contribute stories and poems to the *Youth's Companion*, *Golden Days*, and the illustrated weeklies, making his home, after his graduation, in Kansas City, where he founded, in October, 1888, the successful *Western Authors' and Artists' Club*. He removed to New York in 1889, and for some years was editorially connected with *Town Topics*, continuing his contributions to *Life*, *Truth*, *Leslie's Weekly*, and the monthlies, and for a short time editing the *Marine Journal* and a small periodical known as *Spirit*. In 1895 he founded the *Kansas City Independent*, a weekly paper. He returned to New York in 1900 to accept the editorship of the new magazine, the *Smart Set*, and he continued at its head till his death. Mr. Grissom's poetry was singularly faultless in form, and much of it was not lacking in true soul and spirit.

Guernsey, Mrs. Egbert, philanthropist, born in Newtown, Long Island, N. Y., in 1819; died in New York city, May 20, 1901. She was educated in private schools in New York city. In December, 1850, she married Dr. Egbert Guernsey. Mrs. Guernsey was one of the founders of the Hahnemann Hospital, and of the Guernsey Maternity Hospital, which was afterward merged with the Hahnemann. During the Spanish-American War she led the movement for furnishing aid to the widows and orphans of soldiers. She established an Episcopal church in Montclair, Fla., and another in Peekskill, N. Y., for colored people. She wrote a text-book on English grammar that is in use in the schools of several Western States.

Hale, Horace Morrison, educator, born in Hollis, N. H., March 6, 1833; died in Denver, Col., Oct. 24, 1901. The family removed to Rome, N. Y., in 1837, and four years later to North Bloomfield, N. Y. The father was a manufacturer of agricultural implements, and the son worked in the shop during his youth for nine months of the year. He was graduated at Union College in 1856, and after teaching for a year in West Bloomfield, he went to Nashville, Tenn., and was principal of the Howard School till June, 1861. He then removed to Detroit, Mich., where he studied law and was admitted to the bar in 1863. The next five years he spent in Colorado in search of health, returning to New York for his family in 1865, and making the three trips across the plains with a mule team. From 1868 till 1873 he was principal of the Central City, Col., public schools, and in the meantime was elected superintendent of schools for Gilpin County. In 1873 Gov. Elbert appointed him Superintendent of Public Instruction for Colorado. He was continued in this office until the admission of Colorado as a State in 1876. While superintendent for the Territory he framed the revised school law that is

still the fundamental school law of the State. In 1877 he was recalled to the head of the Central City schools. In 1878 he was elected by the Republican party a regent of the State University for six years. In 1882, and again in 1883, he was chosen mayor of Central City. In 1887 he was made president of Colorado State University, and he ably administered the office until his retirement in 1892.

Hamersley, James Hooker, born in New York city, Jan. 26, 1844; died at Garrisons-on-Hudson, Sept. 14, 1901. He was graduated with honors at Columbia University in 1865, and at Columbia Law School in 1867. For ten years he practised law, finally leaving it to devote his time to acting as cotrustee in the large estate left by his father, the late John William Hamersley. He was an extensive traveler and a well-known society and club man. He was the author of several poems, and contributed articles on politics and history. In 1877 he was nominated for the Assembly, but he withdrew in favor of his friend William W. Astor, who was elected by a large majority, largely through the efforts of Mr. Hamersley.

Hamilton, Morris R., journalist, born in Oxford Furnace, N. J., May 24, 1820; died in Trenton, N. J., Jan. 23, 1901. He was graduated at Princeton in 1839, and admitted to the bar in 1842. In 1849 he began a long newspaper career as editor of the Trenton True American, remaining its owner and editor till 1853. He was afterward on the staffs of the New York National Democrat, the Sussex Herald, the Camden Democrat, Newark Journal, Sussex Record, Kansas City News, Elizabeth Herald, and Philadelphia Record. He was elected State Librarian of New Jersey in 1884, and held the office fifteen years. He was known as Col. Hamilton from having served on the staff of Gov. Foot.

Hammond, Jane Nye, sculptor, born in New York city, March 3, 1857; died in Providence, R. I., Oct. 23, 1901. She spent a great part of her life in study abroad, returning to the United States to work in her studio with the little artist colony in the Grundman Studio Building in Boston, where she had been for more than five years. Afterward she visited Paris several times, spending another year working under Injalbert and Bartlett, studying at the Beaux Arts and attending the Sorbonne lectures. Three examples of her work were accepted at the Champs Élysées Salon. At the World's Fair in Chicago she was a member of the Board of Sculpture for Rhode Island, and exhibited several noteworthy pieces. She also exhibited in Boston, New York, and Providence. She was the representative woman sculptor of her State, and as such she was represented at the Pan-American Exposition, to which she sent, in response to the request of the commissioners, a portrait bust of Stephanie, the little daughter of Hugo Breul, which shows her art at its best.

Haney, Jesse, publisher, born in Nicetown, Pa., Feb. 19, 1829; died in New York city, Aug. 5, 1901. He was apprenticed to a printer in Philadelphia, but he afterward attended the Central High School in that city two years, and then taught in private schools. He removed to New York in 1852, and a year later joined Mr. Levison in the proprietorship of the New York Picayune, the first of the comic papers. Later they began the publication of Nick Nax. Levison died about 1856, and the publication of the Picayune ceased, but Haney continued the publication of Nick Nax till 1859, when it was succeeded by the Comic Monthly, which included

Frank Bellew on its staff, and numbered Thomas Nast, Sol Eytinge, and "Doesticks" Thompson among its contributors. In 1863 Mr. Haney enlisted in the 22d New York Volunteers and served till the end of the war. In 1866 he joined with William Burroughs in the publication of trade manuals and books of dialogues and recitations. They also published Haney's Journal. From 1885 till his retirement from active business in 1897 Mr. Haney was associated in the management of the American News Company.

Hardin, George A., jurist, born in Winfield, N. Y., Aug. 17, 1832; died in Little Falls, N. Y., April 16, 1901. He was graduated at Union College, and received the degree of LL. D. from Hamilton College. He was admitted to the bar in 1854, and practised law in Little Falls, N. Y., in the intervals of his public service. He was a Republican in politics, and was a member of the State Senate in 1861. He was elected justice of the Supreme Court for the 5th Judicial District in 1871, and served as a trial judge till 1879, when, on the reorganization of the General Term, Gov. Cleveland designated him presiding justice of the 4th Department. In the reorganization of the courts following the adoption of the Constitution in 1894 Gov. Morton designated him presiding justice of the Appellate Division for the 4th Department, which place he held till his retirement in 1899.

Harley, Orlando, singer, born in Pittsburg, Pa., in 1856; died in Margate, England, Aug. 28, 1901. He studied in the United States and in Europe, and was accounted one of the most successful American grand-opera tenors. He appeared during the last fifteen years of his life with many of the famous prima donnas.

Harris, William H., naval officer, born in Charlestown, Mass., March 23, 1840; died in Boston, Jan. 5, 1901. He was appointed a 3d assistant engineer in 1861, and assigned to the gunboat Sagamore, then with the Eastern Gulf squadron. In 1863 he was made 2d assistant engineer and assigned to the steam frigate Niagara, on which he served till 1865. He spent one year in the Naval Academy, and then was made 1st assistant engineer. From 1867 till 1870 he served on the Piscataqua, then with the Asiatic squadron; during 1871 and 1872 he was stationed at the Boston Navy-Yard, and from 1873 till 1876 did special duty on the Despatch, on the North Atlantic station. In 1878 and 1879 he was again assigned to the Boston Navy-Yard, and the following year did special duty. From 1881 to 1883 he was on the Galena, then on the European station, and from 1884 till 1889 served in the Bureau of Steam Engineering. Dec. 27, 1883, he was made chief engineer. He was on the Atlanta, in the squadron of evolution, in 1889 and 1890. He was retired June 30, 1900, his last active duty being at the Portsmouth Navy-Yard, to which he was assigned in March, 1899.

Harrison, Benjamin, twenty-third President of the United States (for portrait and biography, see Annual Cyclopædia for 1888), born in North Bend, Ohio, Aug. 20, 1833; died in Indianapolis, Ind., March 13, 1901. He was a son of John Scott Harrison, a grandson of President William Henry Harrison, and a great-grandson of Benjamin Harrison, a signer of the Declaration of Independence. His father was a farmer, and he received his first education in a log schoolhouse facing the Ohio river near the mouth of the Big Miami. Later he was sent to Farmer's College, near Cincinnati, where he remained two years, leaving to enter the junior class at Miami University, Oxford, Ohio. There he made a good

record as a student and a debater and was graduated in 1852. He studied law and was admitted to the bar in 1853. In that year he married Miss Caroline L. Scott, a daughter of the Rev. John W. Scott, principal of a seminary for young ladies in Oxford. In 1854 he removed to Indianapolis and practised law. He began his work as a Republican speaker in the campaign of 1856. In October, 1860, he was elected reporter of the Supreme Court of the State. In August, 1862, he was commissioned a 2d lieutenant of volunteers, recruited Company A of the 70th Indiana Infantry, and upon the reorganization of the regiment, about thirty days later, was commissioned its colonel. He brought the regiment to a high degree of efficiency. He served under Gen. Buell at Bowling Green and Russellville, Ky., and afterward on a long term of guard-duty against guerrillas, protecting railroads in the West. His regiment was attached to the 20th Corps under Gen. Joseph Hooker in the campaign from Chattanooga to Atlanta. He served with special distinction at the battle of Peach Tree Creek, where he commanded a brigade, as he also did at the battle of Nashville. From September to November, 1864, he was on recruiting duty in Indiana. The winter of 1864 he spent with Gen. George H. Thomas in Tennessee, but early in the spring he resumed command of his brigade and was present at the surrender of the Confederate forces under Johnston at Durham Station, N. C. He took part in the grand review at Washington, and was mustered out June 8, 1865. He was brevetted brigadier-general, to date from Jan. 23, 1865, for ability and manifest energy and gallantry in command of his brigade. While he was still at the front, in October, 1864, he was reelected reporter of the Supreme Court. In 1876 he was the Republican candidate for Governor of Indiana, but failed of election. He was appointed a member of the Mississippi River Commission in 1879, and in 1880 was chairman of the Indiana delegates to the Republican National Convention. In the following winter he was elected to the United States Senate, and after his election was offered a place in President Garfield's Cabinet, which he declined. He took his seat in the Senate, March 4, 1881, and served till 1887, during which time he was known as one of the strongest debaters in that body. As president of the Committee on Territories he was persistent in his demand for the admission to statehood of the Dakotas, Montana, Washington, and Idaho, all of which afterward became States through measures signed by him as President. He also spoke for the restriction of Chinese immigration and against the importation of contract labor, and became known as the advocate of protective duties, civil-service reform, and restoration of the United States navy. He was a delegate to the National Convention of 1884, where his name was mentioned for the presidency. At the expiration of his term in the Senate he received the votes of the Republican minority in the Indiana Legislature for reelection. He was nominated for the presidency in 1888 on a protective-tariff platform, and after an exciting campaign, during which he made many speeches, he was elected. He received 233 electoral votes, against 168 for Mr. Cleveland. President Harrison was inaugurated March 4, 1889. His administration was notable for its defense of American interests abroad and for its promotion of American industry and prosperity at home. Its most notable events were the passage of the McKinley bill, the suppression of the Louisiana lottery, the adoption of the reciprocity policy, the extension of the new navy, the pro-

motion of civil-service reform, the arrangement of an international monetary conference, the organization of the Bering Sea arbitration, the difficulty with Chile, and the settlement of the Samoan troubles. Mr. Harrison was nominated for reelection in 1892, and was again opposed by Mr. Cleveland. The election resulted in Mr. Cleveland's election by 276 electoral votes to Mr. Harrison's 145. After retiring from the presidency Mr. Harrison returned to the practise of law, as he had always done in the short intervals of his long and busy public career. In 1893-'94 he delivered a course of lectures on constitutional law before the students of Stanford University. In 1899 he appeared as counsel in the Anglo-Venezuelan Boundary Arbitration Commission, finishing his argument for Venezuela in Paris on Sept. 27. President McKinley appointed him a member for the United States of the Peace Conference held at The Hague in 1899, and he was made a member of the International Board of Arbitration. He devoted much time and energy to church and philanthropic work; was several times a delegate to the General Assembly of the Presbyterian Church, and was a member of the Committee on Creed Revision. Mrs. Harrison died while her husband was President. On April 6, 1896, Mr. Harrison married her niece, Mrs. Mary Scott Lord Dimmock, in New York city. He was the author of *This Country of Ours* (1897). His life has been written by Gen. Lew Wallace (1888). A collection of his speeches, edited by Charles Hedges, appeared in 1888, and another in 1892, and a collection of his magazine articles in 1901.

Harrison, Henry Baldwin, ex-Governor of Connecticut, born in New Haven, Conn., Sept. 11, 1821; died there, Oct. 29, 1901. He was graduated at Yale as the valedictorian of the class of 1846. He studied at Yale Law School, and in 1848 was admitted to the bar. He won a high reputation as a jury lawyer. He was an ardent Henry Clay Whig, and in 1854 he was sent to the Connecticut Senate, where he drafted the Personal Liberty bill that tended to nullify the Fugitive-Slave law in Connecticut. Under this measure the pretending that a free person was a slave was severely punishable. He was associated with the Free-Soil party till it was merged into the Republican party, and he was one of the organizers of the Republican party in his State in 1856, and was that year its candidate for Lieutenant-Governor. In 1865 he represented New Haven in the Assembly, and was instrumental, through a famous speech, in erasing the word "white" from the State Constitution and allowing the negroes to vote. In 1872 he was a candidate for Governor, and was defeated through dissensions in his party. In 1873 and 1883 he was again a Representative, and in 1883 was Speaker. In 1878 he was a candidate for the United States Senate, but he was defeated by O. H. Platt. In 1885 he was elected Governor.

Hart, James McDougall, artist, born in Kilmarnock, Scotland, May 10, 1828; died in Brooklyn, N. Y., Oct. 25, 1901. He was taken by his parents to the United States in 1830, and he afterward entered the shop of a coachmaker in Albany, N. Y., where he worked with his brother as a decorator. He showed a fondness for landscape and animal painting, and the best of his later work is in these fields. He studied with Schirmer in Düsseldorf from 1850 to 1853, and in the latter year established a studio in Albany, where he painted and taught till his removal to New York city in 1857. In 1857 he was elected an associate of the National Academy of Design, and in 1859 made an academician. He served in its council

for many years, and for three years was its vice-president. He received a centennial medal at Philadelphia in 1876, a gold medal at Mechanical Institute, Boston, and a medal at the Paris Exposition of 1889. His pictures include Cattle going Home; Moonrise in the Adirondaeks; Autumn in the Woods; Sunday Afternoon in Berkshire County; Winter on the Adirondaeks (N. A., 1871); Peaceful Homes (1872); In the Orchard, and A Breezy Day on the Road (1874). His Indian Summer and Summer Memory of Berkshire were at the Paris Exposition of 1878. Drove at the Ford is in the Corcoran Gallery in Washington; At the Brookside, in the Metropolitan Museum of Art, New York city; In the Autumn Woods, in Sayles Memorial Hall, Providence, R. I.

Hatch, John Porter, soldier, born in Oswego, N. Y., Jan. 9, 1822; died in New York city, April 12, 1901. He was a descendant of Thomas Hatch, who came to the New World about 1634, and was a great-grandson of Major Moses Porter, who served in the battle of Saratoga. He was graduated at West Point in 1845, and entered the 3d Infantry, serving with that regiment during the Mexican War at Corpus Christi and at Palo Alto, after which he took part in the campaign under Gen. Scott, participating in the battles at Vera Cruz, Contreras, and Churubusco, and in the taking of the city of Mexico, receiving three brevets for gallantry. He became adjutant of the Mounted Rifles, Nov. 1, 1847. At the close of the war with Mexico, he accompanied his regiment on its march from the Missouri river to Oregon, where he served as acting assistant adjutant of the 11th Military Department, and explored the country from Puget Sound to Klamath river. He was sent in the autumn of 1850 to Washington city with despatches from the Pacific, but in 1851 rejoined his regiment, and early in 1852 accompanied it to Texas, where he served two years in campaigns against the Indians. Failing health led to his being ordered to recruiting service until 1856, when he again joined his regiment, and until 1861 was in New Mexico, during which time he participated in the campaigns against the Gila Apaches and the Navajos, and explored the route for a railway from the Rio Grande to the western border of Missouri. He was promoted to captain, Oct. 13, 1860. Soon after the opening of the civil war he was made brigadier-general of volunteers, and he led a brigade at the first battle of Bull Run. He then received command of the cavalry under Gen. Banks, and served under that commander during the campaign in the Shenandoah valley, participating in the battle of Winchester, and covered the retreat. At the second battle of Bull Run he led a charge, and was wounded in the head, but he recovered in time to participate in the battle of South Mountain, where he commanded a division, and was shot in the leg while leading his men, after two horses had been killed under him. For gallantry at this battle he received a medal of honor. While convalescing he served on court-martial duty, had charge of the draft rendezvous in Philadelphia, and organized the cavalry depot in St. Louis, receiving his majority on Oct. 27, 1863. Early in 1864 he was ordered to the Department of the South, where he had the coast division, and cooperated with Gen. Sherman in his march to the sea, participating in the operations against Charleston, to the command of which city he was assigned after its fall. He received the brevet of major-general of volunteers at the close of the civil war, and after being mustered out of that service he returned to the 4th Cavalry, with which he served in Texas, Indian Territory, Montana, and elsewhere. He

was promoted to colonel of the 2d Cavalry in June, 1881, and was retired by action of law on Jan. 9, 1886, having gained a reputation as one of the ablest of cavalry commanders, noted for always having a keen edge upon his sabers.

Haverly, John H., theatrical manager, born in Pennsylvania in 1836; died in Salt Lake City, Utah, Sept. 28, 1901. In his youth he was apprenticed to a shoemaker, but he ran away and became a train-boy on the Pennsylvania Railroad. He soon drifted into theatrical work as door-tender, box-office man, and then as treasurer, and at the age of twenty-one embarked on his own account as the manager of a variety company in Toledo, Ohio. In 1862 the Haverly and Cool Burgess Minstrels were organized. In 1866 Mr. Haverly purchased Cool Burgess's interest and organized the first J. H. Haverly Minstrels. In 1878 he organized the United Mastodon Minstrels, the largest company that had been got together up to that time. They met with great success in the United States, and later played a long and successful engagement at Her Majesty's Theater, London. Two years afterward Haverly's Minstrels, numbering more than 100 people, at Drury Lane Theater, and in 1883, Haverly's Colored Minstrels, with 115 people, repeated in London the success of this earlier company. In partnership with Samuel Colville, Mr. Haverly arranged the great scenic production Michael Strogoff at Booth's Theater. He successfully managed many traveling companies in addition to the minstrels that made him famous, and established the first large theater circuit in the United States. At one time he controlled and managed the Broad Street and Chestnut Street Theaters, in Philadelphia; the Bush Street, Alhambra, and California Theaters, in San Francisco; the New Chicago, Hooley's, Adelphi, and Columbia Theaters, in Chicago; Niblo's Garden, Fifth Avenue Theater, and Fourteenth Street Theater, in New York; and Haverly's Brooklyn Theater. Though eminently successful in his amusement ventures, Mr. Haverly lost several fortunes in Wall Street speculation. In 1898 he became a bankrupt. Later he devoted his attentions to mining in Colorado and Utah.

Hay, Adelbert Stone, diplomat, born in Cleveland, Ohio, Nov. 1, 1876; died in New Haven, Conn., June 23, 1901. He was the eldest son of Secretary of State John Hay, and was graduated at Yale in 1898. After his graduation he spent a few months in London as secretary to the ambassador, returning to Washington when his father was called to the Cabinet. In December, 1899, young Hay was appointed United States consul to Pretoria, to succeed Consul Macrum. He left Pretoria in November, 1900, on leave of absence from the State Department, returning to Washington by way of London, and soon after his arrival in the United States resigned his office. Shortly before his death he had accepted the appointment as assistant secretary to President McKinley, and he was to have entered upon his duties July 1. He was killed by falling accidentally from a window.

Hayden, Charles Henry, artist, born in Plymouth, Mass., Aug. 4, 1856; died in Belmont, Mass., Aug. 4, 1901. He studied at the Museum of Fine Arts in Boston, and later with Boulanger, Collin, and Lefebvre in Paris. His work received honorable mention at the Paris Exposition in 1889, and among other awards he received the Jordan prize of \$1,500 in Boston in 1895, a silver medal at the Atlanta Exposition in 1895, and a bronze medal at the Paris Exposition in 1900. His paintings were chiefly landscape and animal studies.

Hazen, Abraham D., Third Assistant Postmaster-General, born in Northampton County, Pennsylvania, Feb. 24, 1841; died in Washington, D. C., Dec. 3, 1901. He was graduated at Lafayette College in 1863, and received an appointment in the United States Department of Agriculture. Nearly his entire life after that time was spent in the Government service, although he was a graduate of the law department of the Columbian University, in Washington, and during a short term of retirement from public life practised law in that city. In 1866 he was transferred to the Post-Office Department, and rose by gradual promotion to be the principal clerk of the stamp division, and in 1874, when Congress, on the recommendation of the Postmaster-General, created the office of Chief of the Stamp Division, he was immediately appointed to the place. He was instrumental in systematizing the postal-card system and in the introduction of official stamps for the executive departments. He also served as a member of the Civil-Service Examining Board for the Post-Office Department. President Hayes made him Third Assistant Postmaster-General. In 1884 he issued, with the aid of clerks in his department, a pamphlet entitled *The Post-Office Before and Since 1860*, under Democratic and Republican Administrations, on nearly every page of which the Democratic party was charged with incompetency and dishonesty. He tendered his resignation upon the advent of the Cleveland administration, but was retained more than two years because of his knowledge of the business of his office, and then it was accepted only upon his personal solicitation. He was reappointed by President Harrison in March, 1889. At the Columbian Exposition in 1893 he was the representative of the Post-Office Department on the Board of Management and Control of Department Exhibits.

Henderson, Alexander, naval officer, born in Washington, D. C., July 12, 1832; died in Yonkers, N. Y., Jan. 12, 1901. He entered the navy as a third assistant engineer in February, 1851. He was in Commodore Perry's fleet that visited the Orient in 1852-'55, served in the Mediterranean in 1856-'57, and took part in the Paraguay expedition in 1858. He again served in the Mediterranean in 1859 and 1860, and in 1861 he returned to the United States and served in the National fleet through the civil war. Afterward he was successively the fleet engineer of the Asiatic and the European stations. In 1882 Mr. Henderson was made engineering head of the Naval Advisory Board, and the engines of the first vessels of the new navy were designed by him and built under his supervision. When the work of the Advisory Board was finished, in 1889, he became chief engineer of the Boston Navy-Yard. He was retired with the rank of commodore in July, 1894. At the outbreak of the Spanish-American War he volunteered, and served till its close as fleet engineer of the auxiliary navy.

Henry, Benjamin C., clergyman, born near Pittsburg, Pa., in 1850; died in Sharpsburg, Pa., June 21, 1901. He was graduated at Princeton in 1870, and at the Theological Seminary there in 1873. Soon after leaving the seminary he went to China, where for twenty-six years he labored as a missionary, retiring in 1899 on account of failing health. While on a visit to the United States, in 1884, he advocated the establishment of a Christian college in southern China, and he was subsequently honorary president of one that was founded as the result of his efforts. Dr. Henry was the author of *The Cross and the Dragon*, and *Ling-Nan*; or, *Interior Views of Southern China*.

Henschel, Mrs. Georg (Lillian June Bailey), singer, born in Columbus, Ohio, in 1860; died in London, England, Nov. 7, 1901. She went to Boston in 1876, and studied there with Mme. Rudersdoff and her uncle, Charles Hayden. She made her first public appearance in March, 1877, at a concert in Boston, and afterward she sang in Boston, Philadelphia, and New York. In 1878 she studied in Paris with Mme. Viardot-Garcia, and the following year went to London to become a pupil of Georg Henschel. In April, 1879, she made her appearance in London at one of the Philharmonic Society's concerts. She immediately became a great favorite, singing at the Monday popular concerts, the famous Richter concerts, the Crystal Palace concerts, and the great festivals in Germany, Holland, Scotland, and England. She returned to the United States in 1880, and sang at the Worcester festival in September. In 1881 she married Georg Henschel, the composer, singer, and conductor, with whom she gave in Boston during the following winter a series of recitals.

Herne, James A., actor, manager, and playwright, born in Troy, N. Y., Feb. 1, 1840; died in New York city, June 2, 1901. He was educated in the public schools, and made his first appearance as an actor with a small traveling company, with which he remained for a few weeks. For two seasons following 1859 he played with the Adelphi Theater stock company, Troy, N. Y., appearing first as George Shelby in Uncle Tom's Cabin, and afterward in Shakespearian and other rôles; then for three seasons he was at the Holiday Street Theater, in Baltimore. When Ford's Theater was opened in Washington, Mr. Herne was chosen to deliver the opening address. He was next leading man for Susan Dennin, and with her went to California, where in July, 1866, he married Helen Western, and for three seasons following traveled with her, playing leading rôles in support of Lucille Western. During James Fisk's career as theatrical manager, Mr. Herne held under him the place of producer at the Grand Opera-House, New York, at a salary of \$10,000 a year. After Fisk's death Mr. Herne returned to California, and in San Francisco met with success as an actor-manager. In 1878 he married Katherine Corcoran, and soon afterward determined to make his first venture as a star. David Belasco suggested that he write his own play, and acting upon this suggestion Mr. Herne produced his *Hearts of Oak*, which achieved immediate success. Within the three years following he wrote *Drifting Apart*, *The Minutemen of '76*, and *Margaret Fleming*. All were well received, but none reached the popular success of *Hearts of Oak*. Margaret Fleming is considered one of the greatest plays written by an American. In 1883 and 1884 he wrote his most successful play, *Shore Acres*. It was first performed under the title of *The Hawthornes*, in Chicago, in 1892, and was not a success; later it was produced at the Boston Museum under its better-known title. Mr. Herne played it almost continuously till 1899, when he brought out *The Rev. Griffith Davenport*, his dramatization of Helen Gardner's novel *An Unofficial Patriot*. The play was not a pecuniary success. In 1900 Mr. Herne wrote and produced *Sag Harbor*, which was well received in New York and the smaller cities of the country. During the later years of his life he was greatly interested in sociological studies, and was often called upon to address important meetings. His plays and his speeches were characterized by a gentle attitude toward humanity, and his influence for a kindlier sympathy with its mistakes and its misfortunes.

Hertzog, J. G., educator, born in Bechtheim, Germany, Jan. 2, 1831; died in Philadelphia, Pa., Sept. 12, 1901. He studied in the Universities of Mannheim and Mainz, removed to the United States in 1856, and was first employed on a German newspaper in New York city. During the years 1860 and 1864 he was a teacher of languages in La Salle College, Philadelphia, and at the same time Professor of German in Eden Hall, Tonesdale. In 1877 he established a private school, which he conducted till the time of his death. He published a volume of his poems.

Hines, Cyrus C., jurist, born in Sandy Hill, Washington County, N. Y., in 1840; died in Indianapolis, Ind., June 5, 1901. He removed to Indianapolis in 1860, and at the outbreak of the civil war enlisted as a private in the 11th Indiana Infantry, but soon was appointed an aid to Gen. T. A. Morris. Afterward he became major of the 24th Indiana, and later was made colonel of the 57th Indiana Regiment. He was severely wounded at the battle of Stone River, and in 1863 he retired from the service on account of disability from wounds. He practised law in Indianapolis, and in 1866 was elected circuit judge of Hendricks, Marion, Morgan, and Johnson Counties. He retired from active professional life in 1887. He was a founder of the Indianapolis Public Library.

Hinton, Richard Josiah, journalist, born in London, England, in 1830; died there, Dec. 20, 1901. He removed to the United States in the year 1851, and at first worked at his father's trade of mason. Later he became a topographical engineer, and in turn a journalist, editor, lawyer, and author. He became associated with John Brown in Kansas in 1856, and was with Brown at Harpers Ferry, where he narrowly escaped death. Afterward he traveled through the South in the character of an English sympathizer. He made friends with the officers of the Confederate army, saw Jefferson Davis inaugurated President of the Confederacy, and took drawings of many camps and fortifications. He was caught once in Richmond, but escaped through the assistance of a negro. He served through the civil war, and he was one of the first officers to recruit negro troops. Col. Hinton was a brigadier-general of Cuban cavalry with Antonio Maceo in the uprising of 1871. He served at different times as correspondent of the Boston Traveller and the Chicago Tribune, and succeeded Henry George as editor of the San Francisco Post. In 1886 he was employed by the National Bureau of Labor as an expert on labor matters, and he wrote and spoke a great deal on labor questions. He was an expert on the subject of irrigation, and wrote much concerning it. He was author of English Radical Leaders (1875), Handbook of Arizona (1878), and Life of John Brown, and he performed the difficult task of collecting the poems of Richard Realf and writing his life (1898).

Hittell, John Shertzer, author, born in Jonestown, Pa., Dec. 25, 1825; died in San Francisco, Cal., March 8, 1901. He was graduated at Miami University in 1843, studied law, removed to Ottawa, Ill., in 1848, where he taught school, and in the spring of 1849 began the journey overland to California, walking 1,500 miles. After 1853 he was engaged for the greater part of his life in journalism in San Francisco. He published a History of the Mental Growth of Mankind in Ancient Times; Spirit of the Papacy; The Evidences against Christianity (1855); History of San Francisco (1878); The Resources of California (1860); Brief History of Culture (1875); Som-

nambulism and Cramp, translated from Baron Reichenbach's Sensitive Men; and The Mining in the Pacific States.

Hobson, Edward Henry, soldier, born in Greensburg, Ky., July 11, 1825; died in Greensburg, Ky., Sept. 14, 1901. He was a member of the Greensburg and Danville (Ky.) militia. In 1846 he enlisted in the 2d Kentucky Volunteers and was made a 1st lieutenant. He went through the Mexican War and was mustered out in June, 1847. He then returned to his business interests in Greensburg. In 1861 he organized and became colonel of the 15th Kentucky (National) Volunteers. He joined Gen. Buell's army in February, 1862, and was made brigadier-general for gallantry at the head of his regiment in the battle of Shiloh. Before he received his commission he took part in the siege of Corinth. He was present at Perryville, and at Mumfordsville, Ky., he protected the lines of communication, and instructed about 10,000 new troops. In command of the southern division of Kentucky troops, at Marrowbone, Ky., he watched the movements of John Morgan's raiders, and after a slight engagement he pursued Morgan through Kentucky, Indiana, and Ohio, and finally captured him. Gen. Hobson was appointed to the command of Gen. Burnside's cavalry, but owing to failing health was not able to serve. During the latter part of the war he served in repelling raids at Lexington, Ky. His commission as major-general was ready for the President's signature when Lincoln was assassinated. Gen. Hobson was mustered out in September, 1865, and afterward engaged in banking in Greensburg, Ky., and in railroad business. He was president of the Southern division of the Chesapeake and Ohio Railway. He was president of the Mexican War Veterans' Association, and in 1880 was vice-president of the Republican National Convention.

Hodge, John Aspinwall, clergyman, born in Philadelphia, Pa., in 1831; died at Lincoln University, Chester County, Pennsylvania, June 23, 1901. He was graduated at the University of Pennsylvania in 1851, and at Princeton Theological Seminary in 1856. He was pastor of the First Presbyterian Church, in Mauch Chunk, Pa., from 1856 till 1865, when he was called to the First Presbyterian Church of Hartford, Conn., where he remained till compelled by failing health to resign in 1892. In 1888 he visited Brazil in behalf of the Presbyterian Board of Foreign Missions, and on his return to this country he was elected a trustee of the college in São Paulo, Brazil, supported by the Presbyterian board. Dr. Hodge became interested in the Liberian Colonization Society shortly after the civil war, and after a year's rest in 1893 accepted the chair of English Bible and Church Polity in Lincoln University, which was founded before the war for the purpose of educating negro missionaries for Africa. The graduates now go principally to the Southern States. Dr. Hodge was the author of What is Presbyterian Law (1882); Theology of the Shorter Catechism (1888); Recognition after Death (1889); and The Ruling Elder at Work (1892).

Hoffman, Edward Morris, soldier, born in Elmira, N. Y., Jan. 14, 1857; died in Albany, N. Y., May 15, 1901. He enlisted in the New York National Guard, Oct. 10, 1874, in the 110th Battalion, receiving a 2d lieutenant's commission, April 7, 1877. He was made 1st lieutenant of the 30th Separate Company, Nov. 29, 1881, and Dec. 6, 1884, he became a lieutenant-colonel and assistant adjutant-general of the 7th Brigade. He was appointed inspector-general, Dec. 11, 1896, and

reappointed Jan. 1, 1897. Gen. Hoffman was appointed by Gov. Roosevelt as adjutant-general, Jan. 1, 1900, and was reappointed by Gov. Odell, Jan. 1, 1901. He was one of the best known and most popular officers of the National Guard. He commanded the 3d New York Volunteers in the war with Spain. He also saw service in the great railroad riots of July, 1877, and at the switchmen's strike in Buffalo in 1892.

Hogan, John Baptist, clergyman, born at Bodyke, County Clare, Ireland, June 24, 1839; died in Paris, France, Sept. 30, 1901. At the age of seventeen he went to France to study for the Roman Catholic priesthood. In 1852 he was ordained, and, becoming a member of the Sulpician community, taught in the departments of dogmatic and moral theology until 1884. In that year he was installed director of St. John's Theological Seminary, at Brighton, Mass. In 1889 he was selected by the governing board of archbishops for the head of the divinity school of the Catholic university in Washington city. He remained there five years, when he returned to his former post at Brighton. Under Abbé Hogan's management the Brighton seminary attained a high standing, and students were sent to it from all parts of the United States. His published works include Clerical Studies and Daily Thoughts for Priests.

Holbrook, Zephaniah Swift, author, born in Berea, Ohio, Sept. 16, 1847; died in Brookline, Mass., Oct. 23, 1901. He studied at Yale, and after his graduation at the Yale Theological Seminary was pastor of the Oakland Congregational Church of Chicago, and was associate editor of the Alliance. In 1881 he engaged in business in Chicago, and in 1898 removed to Boston. He was sociological editor of the *Bibliotheca Sacra*, and a lecturer and a contributor to literary publications. He published *Lessons on the Homestead Troubles*, *American Republic* and *the Debs Insurrection*, and *Christian Sociology* and other works. Although he was not graduated with his class at Yale, he was made an honorary graduate and received the degree of A. M.

Holman, David Shepherd, inventor, born in Milo, Me., in 1826; died in Bangor, Me., May 13, 1901. Prof. Holman, although to a great extent self-educated, and without the advantage of a scientific training, was a skilful microscopist, and is widely known through the Holman life-slides and other accessories to the microscope. He became connected with the Franklin Institute, Philadelphia, in 1870, and one year later was made actuary of the society, which post he held till 1885. In this time he put forward many inventions, lectured, and, foreseeing the great advantages of the typewriting machine, established a successful school of stenography and typewriting at the institute. He afterward taught stenography and typewriting at Girard College. After leaving Franklin Institute he was employed in the oil-testing laboratories of the Atlantic Refining Company, and while there devised his "viscosimeter." He was a member of the Academy of Natural Sciences.

Holmes, Nathaniel, jurist, born in Peterborough, N. H., July 2, 1814; died in Cambridge, Mass., Feb. 26, 1901. He was graduated at Harvard University in 1837, and was admitted to the Boston bar in 1839. Beginning practise in St. Louis, he remained there until 1868, during which time he had been circuit attorney for the city and county of St. Louis, counselor of the North Missouri Railroad, and justice of the Supreme Court of Missouri, 1865-'68. After holding the Royall professorship of Law at Harvard, 1868-

72, he resumed practise in St. Louis, retiring finally in 1883, since which time he had lived in retirement in Cambridge. He was an ardent supporter of the Baconian theory of the authorship of Shakespeare's plays, and his discussion of the subject is altogether the ablest presentment of the Baconian side of the question. His published works are *The Authorship of Shakespeare* (1866 and 1886) and *Realistic Idealism in Philosophy Itself* (1888).

Hooker, John, lawyer, born in Farmington, Conn., April 19, 1816; died in Hartford, Conn., Feb. 12, 1901. He was graduated at Yale in 1837, studied at the Yale Law School, and was admitted to the bar. From 1858 to 1894 he was reporter of judicial decisions by the Supreme Court of Connecticut. The greater part of the Connecticut law reports were prepared and published by him. He reported under 7 chief justices. Mr. Hooker was one of the original antislavery men of Connecticut. He was a member of the Legislature in 1850. In 1841 he married Isabella Beecher, daughter of the Rev. Lyman Beecher and sister of Henry Ward Beecher and of Harriet Beecher Stowe. Mrs. Hooker is widely known as a woman suffragist, and her husband was in full sympathy with the movement. He published his *Reminiscences* in 1899.

Hopkins, Samuel Miles, educator, born in Geneseo, N. Y., Aug. 8, 1813; died in Auburn, N. Y., Oct. 29, 1901. He was graduated at Amherst College in 1832, studied at Auburn and Princeton Theological Seminaries, and was ordained in the Presbyterian ministry in 1840. After brief pastorates in Corning, Fredonia, and East Avon, N. Y., he was appointed Professor of Church History and Ecclesiastical Polity in Auburn Theological Seminary. He remained in active service till 1893, when he was made professor emeritus. In 1866 he was moderator of the Presbyterian General Assembly. He published *A Manual of Church Polity* in 1878, and later a *Liturgy and Book of Common Prayer*, as a contribution of his interest in the movement to introduce precomposed forms of worship into the Presbyterian Church.

Houghton, Henry Clarke, physician, born in Roxbury, Mass., Jan. 22, 1837; died in New York city, Dec. 1, 1901. He was graduated at Bridgewater Normal School in 1859, and from 1861 to 1863 he taught natural sciences in Yarmouth, Me., Academy. He received his medical degree at New York University in 1867. He was resident physician to the Five Points House of Industry from 1867 to 1869; Professor of Physiology in the New York Homeopathic Hospital from 1868 to 1870; and Professor of Otolaryngology from 1870 till his death. He was Professor of Physiology in the New York College for Women from 1869 to 1872. In 1868 he was appointed surgeon in the New York Ophthalmic and Aural Institute, and later became its dean. Dr. Houghton was noted as a specialist in diseases of the eye and the ear, and he was an officer in many homeopathic medical societies. He was the author of *Lectures on Clinical Otolaryngology*, and of many papers relating to his work as an oculist and aurist.

House, Edward Howard, journalist, born in Boston, Mass., Sept. 5, 1836; died in Tokio, Japan, Dec. 18, 1901. He was largely self-educated; studied music from 1851 to 1854, composing orchestral pieces; and worked at the same time as a bank-note engraver. He was part proprietor, associate editor, and musical and dramatic critic of the *Boston Courier* from 1854 till 1858; special correspondent, associate editor, dramatic and musical critic of the *New York Tribune* from

1859 till 1873; on the editorial staff of the New York Times in 1870; and from 1874 to 1876 correspondent from Japan and Formosa of the New York Herald. After 1870 he resided chiefly in Japan, where he devoted his energies especially to the defense of Japan's international rights. He was Professor of English in the University of Tokio from 1871 to 1873. He established and conducted, from 1877 till 1880, the Tokio Times, a weekly periodical. In 1900 he was appointed director of the Imperial Court Orchestra, and in that year prepared and conducted the first orchestral concerts given in Japan. Besides many magazine articles, he published *The Simonoseki Affair* (1874); *The Kagosima Affair* (1874); *The Japanese Expedition to Formosa* (1875); *Japanese Episodes* (1882); *Yone Santo*; and *The Midnight Warning*.

Howgate, Henry W., soldier, born in England; died in Washington, D. C., June 1, 1901. During the civil war he entered the National army as 2d lieutenant, 22d Michigan Volunteers, Aug. 14, 1862; was promoted 1st lieutenant, Jan. 17, 1863; and was assigned to the signal corps as 1st lieutenant, March 3, 1863. He was brevetted captain of volunteers, March 13, 1865, for gallant and meritorious service in the battle of Chickamauga, and major of volunteers for the Atlanta campaign; he was mustered out June 20, 1866. He then entered the regular army as 2d lieutenant, 20th Infantry, Oct. 22, 1867; brevetted 1st lieutenant and captain, Oct. 22, 1867; unassigned, July 28, 1869; reassigned to 20th Infantry, Aug. 3, 1870; promoted 1st lieutenant, Aug. 4, 1875; and resigned, Dec. 18, 1880. For some years previous to his resignation he had been disbursing officer of the United States Signal Service Bureau in Washington. When Gen. Hazen assumed charge of the bureau in 1881 he made an investigation of certain shortages in the accounts of Howgate, which resulted in his arrest, Aug. 16, 1881, on the charge of embezzling \$90,000. April 13, 1882, he escaped from the charge of a deputy marshal, and for thirteen years was not caught. He was discovered in New York, Sept. 26, 1894, taken to Washington, acquitted on one trial, and finally convicted and sentenced, Nov. 14, 1895, to eight years' imprisonment. The amount of his shortage was more than \$350,000.

Howland, Weston, oil-refiner, born in New Bedford, Mass., in 1816; died in Fairhaven, Mass., June 16, 1901. Beginning as a cabin-boy on a merchant ship, he followed the sea during his early life, rising through successive grades to the command of a vessel. After quitting the sea he became a ship-chandler and commission merchant, continuing in this business till he began the manufacture of kerosene oil. In 1860 he was secretary of the New Bedford Coal-Oil Company, a concern that by a crude process supplied a marketable form of petroleum. At this time a chemist of Schieffelin Brothers, of New York, suggested to Mr. Howland that he should experiment with a view to placing on the market a more salable illuminator than the coal-oil of the day. Petroleum, though it had been known for years, never had been refined. At that time there were a few wells in Pennsylvania, and Schieffelin Brothers had about 2,000 barrels of the oil on hand. Mr. Howland decided to make an attempt at refining the oil, and a barrel was shipped to him. His first attempt at distillation, with a large kettle from his kitchen as a condenser, was successful, but the product was thick, muddy, vile-smelling, and unrefined. A milk-pan was the next piece of improvised apparatus, and he went on experimenting with alkalis and water. The result was

a foggy mixture. Discouraged, he put the oil in a pan with the oil and alkalis in his back and left it, and when he went back he found it had been solved. The barn door had been open, and the beams of the afternoon sun had completed the process. That evening he lighted three lamps—one with the coal-oil, one by the New Bedford Company, and one by the Downer's oil, and a third with his refined petroleum. He lighted them and called in his neighbors, who at once selected the petroleum-filled lamp, giving the largest and brightest flame. Convinced that this was the illuminating oil of the future, Mr. Howland at once purchased the oil works on Fish island and began to manufacture for the market. He purchased 1,500 barrels of oil, at 25 cents a gallon, and sold the refined oil at 75 cents a gallon as fast as he could manufacture it. The Downers attempted to block him by purchasing all the petroleum on the market, but Mr. Howland sent an agent to the oil-fields in November, 1860, and contracted for the entire product. Two months later his factory was destroyed by fire as the result of an explosion, in which two men were killed. Mr. Howland covered the machinery with old sails, that his rivals might not copy it, and began rebuilding the following day. Soon other refineries were built, and at length the nucleus of the present Standard Oil Company began to make it difficult for competitors to do business, and Mr. Howland, though one of the last to feel its effects, was finally forced out of the manufacture. He was a member of the New Bedford Board of Aldermen in 1866, and from 1886 to 1890 was collector of the port of New Bedford.

Hoyt, Benjamin Carleton, banker, founder of St. Joseph, Mich., born in Sandown, N. H., Jan. 26, 1807; died in St. Joseph, Mich., March 27, 1901. He went west when he was twenty-one years old, and in 1829 erected a log store-building at the present foot of State Street in St. Joseph. At that time the country had not been surveyed by the Government, it was heavily timbered, and the only road leading to the lake was an Indian trail along the river. In 1831 he built the first frame house, and in 1832 he incorporated the settlement as Newburyport, afterward changing the name to St. Joseph. At the breaking out of the Black Hawk War, in 1832, Mr. Hoyt raised a company of 40 men, who were stationed at the mouth of the St. Joe river to hold in check the Ottawas, Chippewas, and Pottawatomies till Black Hawk should be subdued. Besides a liberal bounty, each member of this company (the first raised in the country) received a pension of \$96 a year and 160 acres of land. Mr. Hoyt was the only surviving pensioner of the Black Hawk War. For many years he was engaged in banking in St. Joseph.

Hubbard, Richard B., ex-Governor of Texas, born in Walton County, Georgia, Nov. 1, 1832; died in Tyler, Texas, July 12, 1901. He was graduated at Mercer University, Georgia, in 1851. After completing his law studies at the University of Virginia and at Harvard, he returned to Georgia, whence he emigrated with his father to Texas in 1853. He practised in Tyler, and in 1856 was a delegate to the Democratic National Convention. He was United States District Attorney for the western district of Texas from 1857 to 1859, when he resigned to become a member of the Legislature. He resigned in 1862 and raised the 22d Texas Infantry, and continued its colonel throughout the war. He was disfranchised for some years after the war, and when the civil disabilities were removed he reentered

politics. He was president of the Democratic State Convention in 1873, and chairman of the Democratic State Executive Committee. He was elected Lieutenant-Governor in 1873, and became Governor when Gov. Coke was elected to the United States Senate in 1876, and held the office till 1879. He was a delegate to the Democratic National Convention of 1880, and temporary chairman of the Democratic National Convention of 1884. He was minister to Japan in 1885. He ranked high as a platform orator, one of his most notable speeches being that delivered at the Philadelphia Centennial in 1876. He published, in 1900, *The United States in the Far East; or, Modern Japan and the Orient*.

Huidekoper, Rush Shippen, physician, born in Meadville, Pa., May 3, 1854; died in Philadelphia, Pa., Dec. 17, 1901. He was graduated in medicine at the University of Pennsylvania in 1877, and at the National Veterinary School, Alfort, France, in 1882, and spent the following year in the laboratories of Virchow, Koch, Chauveau, and Pasteur. After returning to the United States he was engaged in hospital practise, and was Commissioner-General to the Agricultural Exposition, Hamburg, Germany, 1883. He became dean of the veterinary department, University of Pennsylvania, and Professor of Internal Pathology and Contagious Diseases, Zootechnics and Hygiene, Comparative Anatomy, and Veterinary Surgery in the New York College of Veterinary Surgery. He was major and brigade surgeon in the National Guard from 1878 to 1891; acting assistant quartermaster-general after the Johnstown flood in 1888; and later lieutenant-colonel and surgeon-in-chief. He was made lieutenant-colonel and chief surgeon, United States volunteers, in 1898, and he served as chief surgeon to the 1st Army Corps after the outbreak of the Spanish-American War, and later in the same capacity with the army in Porto Rico. Dr. Huidekoper published the following books: *Age of Domestic Animals*, *The Cat*, and *The Veterinary Blue Book*, and was editor of the *Journal of Comparative Medicine and Veterinary Archives*, Philadelphia, after 1889.

Hungerford, Mary Churchill, author, born in Staffordshire, England, Jan. 25, 1832; died in Paris, France, Sept. 18, 1901. Her father, William Churchill, of New York city, was a wealthy merchant and importer of fine china. She was educated in private schools in England, France, Italy, and the United States. Her brilliant mind and social gifts had won her distinction before necessity forced her in later years to her pen for support. She was the author of *The Friendly Five*, and *Philip*, books for young girls, and of many magazine articles.

Hutton, William Rich, civil engineer, born in Washington, D. C., March 26, 1826; died in Cloppers, Md., Dec. 11, 1901. For several years he was chief engineer of the Washington, D. C., Water-Works and of the Chesapeake and Ohio Canal, and he was chief engineer in the construction of the Washington aqueduct. He removed to New York to become chief engineer for the English syndicate that began the tunnel under the Hudson river, and subsequently he superintended the construction of the Washington Bridge across Harlem river. He was a member of the Maryland Historical Society, the American Society of Civil Engineers, the Institution of Civil Engineers of London, and the Société des Ingénieurs Civils de France.

Hyatt, Thaddeus, inventor, born in Rahway, N. J., July 21, 1816; died in Sandown, Isle of Wight, England, July 25, 1901. He was the in-

ventor of the bull's-eye lens, used as a means of increasing the light in vaults under street sidewalks, and through its manufacture made the fortune that he afterward devoted to the anti-slavery cause. He was the intimate friend of Sumner, Greeley, and the leaders of the abolitionist movement, and his house in Morton Street was John Brown's headquarters in New York city. After the execution of John Brown, Mr. Hyatt was summoned to appear before the United States Senate Committee to give testimony regarding the movements leading up to the Harpers Ferry incident. He refused to appear, and was committed to the old Capitol Prison in Washington, where he was confined several weeks. He had his cell decorated and furnished, issued invitations to his friends, and kept an autograph-book of his visitors, which contains the names of many distinguished men. He sent out anti-slavery communications to various papers and magazines, and arranged for a series of meetings in Cooper Union, New York. The first in the series was called the "John Brown Meeting," and was addressed by Wendell Phillips and others. When Kansas was suffering from famine, shortly after the election of Abraham Lincoln, as the result of the failure of the crops, Mr. Hyatt organized the Kansas Relief Committee. He went to that State and personally superintended the distribution of money, clothing, and food until the work was completed. His later years he spent in extensive travel. In appearance he resembled Garibaldi, and once, while walking in Paris, he was arrested by a detective, who was positive that his prisoner was the Italian patriot. Mr. Hyatt could not speak French, but he soon obtained his release.

Irwin, John, naval officer, born in Philadelphia, Pa., April 15, 1832; died in Washington, D. C., July 28, 1901. He was graduated at the Naval Academy in 1853; was commissioned master, Sept. 15, 1855; lieutenant, Sept. 16, 1855; lieutenant-commander, July 16, 1862; commander, July 25, 1866; captain, May 15, 1875; commodore, March 4, 1886; and rear-admiral, May 19, 1891. He served on the Cumberland, St. Lawrence, John Adams, Fulton, and Savannah, and on the Wabash during the civil war. With the latter he was engaged in blockading service, and participated in the capture of the forts at Hatteras Inlet and of Forts Walker and Beauregard, at Port Royal, S. C. He was present also at the capture of Fort Pulaski. He commanded successively the Newbern, Gettysburg, Yantic, Sabine, and Pensacola, in the North Atlantic and the Pacific squadrons, from 1868 till 1879. In 1872 he was in command of the League Island station, and from 1879 to 1883 in command of the Mare Island Navy-Yard. He was president of the Board of Inspection for California from 1884 to 1888; afterward in command of the naval forces on the Pacific coast; commander of the Mare Island Navy-Yard, and on March 16, 1893, he succeeded Admiral Harmony in the command of the Asiatic station. He was retired April 15, 1894, having reached the age limit, after twenty-one years and eleven months of sea service and nineteen years and ten months of other duty.

Jackson, Francis Aristide, educator, born in Northumberland, Pa., March 20, 1830; died in Overbrook, Pa., April 4, 1901. He was graduated at the University of Pennsylvania in 1848. The University of Indiana conferred upon him the degree of LL. D. in 1883. For a short time he engaged in civil engineering, but in 1849 he accepted an appointment as assistant master in the Episcopal Academy of Philadelphia, where he taught

mathematics and chemistry. In 1855 he was elected Adjunct Professor of Latin and Greek in the University of Pennsylvania, and in 1864 he was made Professor of Latin, which chair he occupied until his death. He was a recognized leader in his subject of instruction, and took a wide interest in everything connected with the university. Through his efforts the library of Prof. Ernst von Leutsch, of Göttingen, comprising about 18,000 volumes in classical philology, was secured for the University of Pennsylvania in 1888. He also raised the fund for the erection in the college chapel of a memorial tablet to the alumni who fell in the civil war. For the use of his classes Prof. Jackson published treatises on Latin syntax and prosody, and on the Horatian meters, besides emendations of the texts of several Latin authors, and a Latin syllabus to accompany instruction in the freshman year.

James, Edward C., lawyer, born in Ogdensburg, N. Y., May 1, 1841; died at Palm Beach, Fla., March 24, 1901. He was educated in the public schools and at Walnut Hill Academy, Geneva, N. Y. At the outbreak of the civil war he enlisted in the 50th New York Volunteers, and shortly afterward was made adjutant. Later he was commissioned assistant adjutant-general of the engineer brigade of the Army of the Potomac, aide-de-camp to Gen. Woodbury, major of the 60th New York Volunteers, lieutenant-colonel of the 106th New York Volunteers, and colonel of the same regiment. In the autumn of 1863 he resigned on account of disability incurred in the service. Col. James was admitted to the bar in 1863, and practised law in Ogdensburg till 1874, when he removed to New York city. He was counsel for the Manhattan Elevated Railway Company and the Jay Gould estate. He recovered a verdict of \$37,000 against the Metropolitan Street Railway Company for the death of Capt. Rhodes, of the 7th Regiment. He successfully defended Russell Sage in the suit for \$100,000 damages brought against him by William R. Laidlaw, who was injured when Norcross threw a bomb in Sage's office.

Janes, Lewis George, political economist, born in Providence, R. I., Feb. 19, 1844; died in Greenacre, Me., Sept. 5, 1901. He was graduated at the Providence High School, and afterward received the degree of M. A. from Brown University. He was president of the Brooklyn (N. Y.) Ethical Association from 1885 to 1896; instructor in history in Adelphi Academy in 1894 and 1895; and lecturer on sociology and civics in the School of Political Science, Brooklyn, from 1893 to 1896. In 1896 he removed to Cambridge, Mass., to become the director of the Cambridge Conference and the Monsalvat School of Comparative Religion, Greenacre, Me. He was president of the Free Religious Association of America after 1899. In addition to his lectures and contributions to periodicals, Prof. Janes published *A Study of Primitive Christianity* (1887); *Evolution of Morals* (1889); *Scope and Principles of the Evolution Philosophy* (1890); *Life as a Fine Art* (1891); *The Problem of City Government* (1892); *War and Progress* (1893); *Cosmic Evolution as related to Ethics* (1895); *Samuel Gorton, First Settler of Warwick, R. I.* (1896); *Social Ideals and Social Progress* (1899); and *Health and a Day* (1901).

Jasper, John, negro clergyman, born in Fluvanna County, Florida, July 4, 1812; died in Richmond, Va., March 30, 1901. He was the youngest of 24 children, and in his boyhood worked on the plantations with the other slaves. On his twenty-seventh birthday he was converted, and on the 25th of the same month united with

the church. He at once set about to learn to read, that he might be able to read the scriptures, and after seven months he had a spelling-book, assisted by another slave, William Jackson, he advanced to the Bible, and preached in the neighborhood on Sabbath days. He said that during the civil war he was a visitor to the wounded in the Confederate hospital near his master's home. His first pastoral position was in Petersburg, where he is said on one occasion to have baptized 300 candidates in two hours. He served several negro churches in Richmond and other cities, and soon after the civil war became the pastor of the Sixth Mount Zion Baptist Church, of Richmond. In 1868 his congregation bought a neat brick edifice, which has since been remodeled. The church has a membership of more than 2,000, and has long been prosperous. There he first delivered the "sun do move" sermon which made him famous. This sermon was based on Exodus xv, 3: "The Lord is a man of war; the Lord is his name," and in it the preacher held that "we live on a four-cornered earth," around which the sun moves. "The Bible says the sun stood still," he announced dogmatically. "Is anybody going to say the sun was standing still before Joshua told it to stand still? Do you think Joshua would have asked the privilege to stop the sun if she had not been moving? This morning when the sun rose she was over there [pointing to the east]. How in the name of God could the sun get from that side of the house over to this [pointing to the west] unless it moved? Now, Solomon was certainly a scholar. Do you know he was the man who said, 'The sun ariseth and goeth down and hasteneth back to the place she moved from'? It is nonsense to say that the sun does not move. Every man who ever read the Bible knows the sun do move." This sermon was published in a local paper, and was copied all over the country and throughout Europe. In some foreign quarters it was taken seriously, and many ludicrous discussions resulted. Jasper refused offers of lecture engagements, but by request repeated his famous sermon many times, and up to the time of his death the announcement that he would preach from the text "The Lord is a man of war" was enough to fill the church to overflowing.

Joos, Edward, clergyman, born in Somergem, Belgium, April 9, 1825; died in Monroe, Mich., May 18, 1901. He completed the classical course in the College of Thiel, studied at the Seminary of Ghent, and was ordained in the Cathedral there, June 17, 1848. In September, 1856, he came to the United States and was stationed at St. Anne's Church, Detroit, till Nov. 5, 1857, when he was appointed pastor of St. Mary's parish, Monroe, Mich., and placed in charge of the newly organized Congregation Sisters, Servants of the Immaculate Heart of Mary. There he was identified for nearly half a century with the work of Catholic education, building up not only an institution of learning, but a community of trained teachers as well. When Bishop Borgess resigned, in 1887, Father Joos was again appointed administrator by Rome, which office he held till the consecration of the Right Rev. Bishop Foley, who on his first visit to St. Mary's Academy, Dec. 3, 1888, named Father Joos vicar-general of the diocese. In recognition of his services to the Church and to the cause of education, Leo XIII, in April, 1889, conferred upon him the title of Monsignor, Domestic Prelate of the Pope.

Kellogg, Elijah, clergyman and author, born in Portland, Me., May 20, 1813; died in Harpswell, Me., March 17, 1901. He was graduated at Bow-

doin College in 1840, studied at Andover Theological Seminary, and in 1844 he was ordained pastor of the Congregational church in Harpswell. Resigning his pastorate in 1855, he removed to Boston, where for ten years he was chaplain of the Seamen's Friend Society. He was subsequently in charge of a Congregational church at Rockport, Mass., but after a short time returned to Harpswell, which was his home for the rest of his life. While a student at Andover he wrote the famous blank-verse address, *Spartacus* to the Gladiators, familiar to every American school-boy, as well as *Regulus* to the Carthaginians and *Pericles* to the People, and on his return to Harpswell he began writing books for young people, *Charlie Bell, the Waif of Elm Island* (1868), being the first. His juvenile tales still continue popular, but his fame is likely to be longest preserved by the *Spartacus*. He published also *The Ark of Elm Island* (1869); *The Boy Farmer of Elm Island* (1870); *Hardscrabble of Elm Island* (1870); *Norman Cline* (1870); *The Young Shipbuilders of Elm Island* (1870); *Arthur Brown, the Young Captain* (1871); *The Cruise of the Casco* (1871); *The Young Deliverers of Pleasant Cove* (1871); *The Sophomores of Radeliffe* (1871); *The Spark of Genius* (1871); *The Child of the Island Glen* (1872); *John Godso's Legacy* (1873); *Sowed by the Wind* (1873); *The Turning of the Tide* (1873); *A Stout Heart* (1873); *Winning his Spurs* (1873); *The Fisher Boys of Pleasant Cove* (1874); *Wolf Run* (1875); *Brought to the Front* (1876); *The Mission of Black Rifle* (1876); *Forest Glen* (1877); *Good Old Times* (1877); *Burying the Hatchet* (1878); *A Strong Arm and a Mother's Blessing* (1880); *The Unseen Hand* (1882); *The Live Oak Boys* (1883).

Kellogg, George, inventor, born in Pine Meadow, Conn., June 19, 1812; died in New Hartford, Conn., May 6, 1901. He was graduated at Wesleyan University in 1837, and after engaging for a short time in the manufacture of machinery he was principal of Sumter Academy, Sumterville, S. C., from 1838 to 1841. He then became a manufacturer in Birmingham, Conn., and in 1855 removed to New York city to educate his daughter, Clara Louise, who at an early age attracted attention by the quality of her voice. From 1863 to 1866 he was a United States revenue officer, and afterward engaged in manufacturing and in experiments at Cold Spring, N. Y. He was an expert in shorthand writing and made many additions to the methods of studying stenography. For his mechanical knowledge and inventive ability he was called as an expert witness in many notable patent cases. His more important inventions were a machine for making jack-chain at the rate of a yard a minute (1844); a dovetailing machine (1849); a type distributor (1852); an obstetrical forceps (1853); and an adding apparatus (1869). In 1845 he established a manufactory of hooks and eyes, with American machinery, at Redditch, England, and in 1868 he began to make hats in London, under a patent issued to his brother, Albert Kellogg, the botanist and inventor.

Kendall, Edward Hale, architect, born in Boston, Mass., July 31, 1842; died in New York city, March 10, 1901. He was educated at the Boston Latin School and at the School of Fine Arts in Paris. He was the architect of the original Equitable Life Assurance Building and of the Methodist Book Concern Building, both in New York city, and the New York houses of Robert and Ogden Goellet. As consulting architect of the Department of Docks he directed the building of the recreation piers along the New York water-

front. He was president of the World's Convention of Architects in Chicago in 1893; president of the New York Chapter of the Institute of American Architects, 1887-'91; and president of the American Institute of Architects in 1892-'93.

Kennedy, George Nestor, jurist, born in Marcellus, N. Y., Sept. 11, 1822; died in Thousand Island Park, N. Y., Sept. 7, 1901. He studied law, and was admitted to practise in 1842. In 1854 he removed to Syracuse. He was a delegate to the convention that nominated Martin Van Buren for the presidency in 1848, and to the National Republican Convention of 1856. He was elected to the State Senate in 1863, and served till 1871. While there he served as chairman of the Committee on Privileges and Elections, and won distinction by introducing a resolution opposing the granting of money to private, parochial, and sectarian schools. He was elected justice of the Supreme Court of New York for the 5th District in 1883, and was retired Jan. 1, 1893, having reached the age limit.

Kimball, Lorenzo W., inventor, born in Pittsford, Vt., May 24, 1814; died in Rutland, Vt., April 13, 1901. He was a machinist and pattern-maker by trade, and during his life he was engaged in several manufacturing enterprises in Brandon, Rutland, and Pittsford. During the civil war he was employed in the Colt armory in Hartford, Conn., and was a gun inspector in the United States Arsenal in Springfield, Mass. After 1872 he resided in Rutland. About 1865 he bought a thread factory in Pittsford, and after running it as a machine-shop for a short time he sold it to a straw-board manufacturing company. Mr. Kimball never had seen heavy paper manufactured before, and he was much impressed with its hardness and durability. His interest led him to invent the paper car-wheel. The first 12 wheels he made with his own hands in a little shop in Brandon. Four of them were put under one end of a freight-car and run on the Rutland Railroad several months. The other 8 were put under a Pullman palace-car and run 500,000 miles without repairing anything but the steel tires. These tests demonstrated the practicability of the invention, and Mr. Kimball and Mr. Allen, of the paper firm, took out patents and began the manufacture of the wheels in Pittsford. After two years the plant was removed to Hudson, N. Y., and the wheels, now in extensive use, are manufactured by the Pullman Car Company. Mr. Kimball retired from the company before it left Pittsford, and realized little from his inventions, although his associates are said to have made a fortune. He also took out patents for a paper door in 1868, and in the following year for paper mouldings, but these never came into general use.

King, Clarence, geologist and author, born in Newport, R. I., Jan. 6, 1842; died in Phoenix, Arizona, Dec. 24, 1901. He received his early education in Hartford, Conn., where, at the high school, Mary A. Dodge (Gail Hamilton) was his teacher in English composition. He was graduated at Sheffield Scientific School, Yale, in 1862, and crossed the plains, and for three years was employed in the geological survey of California, under Prof. Josiah D. Whitney. In the course of this work he and James Terry Gardiner made the first survey of the Yosemite valley, and constructed a complete map, from which a model was afterward made. In 1866 Mr. King went to Washington to urge upon the Government his plan for a geological survey of the whole western part of our domain. In this he was successful, and that portion of the work designated as the Survey of the Fortieth Parallel was assigned to him. With a force of

scientific and professional men—naturalists, mining engineers, geologists, surveyors, besides laborers and teamsters, numbering in all about 100—he set himself to the task, which was under the

auspices of the engineering department of the army. This occupied five years, and was completed in 1872. Of the 6 large volumes that make up the report, the first, entitled *Systematic Geology*, was written by Mr. King, and has been admired for the perfection of its literary style as well as its scientific value. His paleontological discoveries furnished the evidence by which the age of the gold-bearing rocks was determined. In 1872 certain swindlers attempted a great fraud by "salting" a certain territory in Arizona with rough diamonds, and then announcing the discovery of rich diamond-fields. The trick was detected and exposed by Mr. King, and the scheme failed. He originated and promoted the plan for a permanent geological bureau, bringing all the Government work under one director, and when the bill was passed by Congress, in 1878, he was placed at the head of it. But three years later he resigned, for personal and financial reasons. He at once had a large practise as a mining expert, and became interested in several mining enterprises in the Western Territories and in Mexico. He also carried on a long and costly series of experiments and observations in physical geology, the results of which were contributed to *Silliman's Journal* for January, 1893, under the title *The Age of the Earth*. He published in the *Atlantic Monthly*, in 1871, a series of papers that were issued the next year in book form under the title *Mountaineering in the Sierra Nevada*, which are perhaps the most brilliant literary productions that ever came from the pen of a professional scientist. The book was republished in England, and had a large sale in both countries. His other contributions to periodicals include a notable story entitled *The Helmet of Mambrino*, which appeared in the *Century* in 1886, and an essay entitled *Artium Magister* in the *North American*

Review. Mr. King had a taste for art in its various forms, and was a collector of classical literature. In company with some of the most remarkable men of his time he was as a *raconteur* an excellent power. "The trouble with King is, that the glow of a sunset spoils the original." He spent much time in successive trips to Europe, and sailed on many seas. His last travels were in the Klondike region. He was a member of the National Academy of Sciences. Mr. King was one of the kindest hearted of men, and did many deeds of benevolence that involved personal risk as well as pecuniary outlay. He never married.

Knipe, Joseph Farmer, soldier, born in Mount Joy, Pa., Nov. 30, 1823; died in Harrisburg, Pa., Aug. 18, 1901. He served in the ranks in the Mexican War, and afterward he engaged in business in Harrisburg. In 1861 he organized the 46th Pennsylvania Volunteers and became its colonel; he was commissioned brigadier-general of volunteers in 1862. He served with the Army of the Potomac and that of the Cumberland, and commanded a division at the fall of Atlanta, afterward serving as chief of cavalry in the Army of the Tennessee. He was twice wounded at Winchester, Va., twice at Cedar Mountain, Ga., and once at Resaca, Ga. He was retired at his own request in September, 1865, refusing a colonelcy in the regular service. He was postmaster of Harrisburg, Pa., during the Johnson administration, and for a time was superintendent of one of the departments in the military prison at Fort Leavenworth, Kan.

Kraus, Adolf Robert, sculptor, born in Zeulenroda, Germany, Aug. 5, 1850; died in Danvers, Mass., Nov. 7, 1901. He was a pensioner of the Prussian Government, a winner of the Grand Prize of Rome, and a sculptor of reputation before he removed to the United States in 1881. His best work is represented by the Theodore Parker and Crispus Attucks monuments, in Boston. He was the sculptor of the winged figures of Victory that crowned the towers of Machinery Hall at the Columbian Exposition in Chicago in 1893. Shortly before his death he had all but completed the clay model of a heroic figure of Belshazzar at the moment of seeing the handwriting on the wall when it began to crumble. His failure to produce this masterpiece unbalanced his mind and hastened his death.

Kreutzer, William, soldier, born in Benton, N. Y., Sept. 11, 1828; died in Lyons, N. Y., May 27, 1901. He was graduated at Genesee College in 1853, and afterward accepted the professorship of Greek in that institution. He entered the National army as a captain in the 98th New York Volunteers, and served as adjutant-general of the Department of the South. He was in charge of the voting of the sick soldiers in the Department of Virginia and North Carolina in 1864, and the same autumn, under Gen. Butler, assisted in maintaining order in New York city during the election. Meanwhile he had risen

to the rank of colonel. He was military correspondent of the New York Tribune throughout the war.

Kyle, James Henderson, United States Senator, born near Xenia, Ohio, Jan. 24, 1854; died in Aberdeen, S. Dak., July 1, 1901. He studied civil engineering in the University of Illinois, and in 1878 was graduated at Oberlin in the classical course, and at the Western Theological Seminary, Allegheny, Pa., in 1882. While taking his theological course he taught mathematics and engineering in Pittsburg. He was three years pastor of Plymouth Congregational Church in Salt Lake City, and afterward traveled through Colorado and Utah as a home missionary. He preached for a time in Ipswich, S. Dak., and in 1888 became pastor of the Congregational church in Aberdeen. A year and a half later he resigned to become the financial agent of Yankton College. On July 4, 1890, he was unexpectedly called upon to deliver an oration before the citizens of Brown County, South Dakota. He spoke about half an hour, advocating the more general distribution of wealth and denouncing the corruption of politics. As the result of this speech he was elected to the State Senate in the autumn of that year. Following a deadlock in the Legislature, he was elected as an independent to the United States Senate. He was reelected in 1897. He was a Republican until 1887, but then joined the Democratic party, and, when he was elected to the United States Senate, it was by the votes of the Farmers' Alliance members. He had been a Prohibitionist and was known as a sympathizer with the female-suffrage movement. On Dec. 28, 1899, he announced his abandonment of the Populist party. After that time he was classified in the Congressional Directory as a Republican. After March, 1893, Senator Kyle served as chairman of the Senate Committee on Education and Labor.

Ladue, Joseph, miner, founder of Dawson City, born in Plattsburg, N. Y., in 1853; died in Schuyler Falls, N. Y., June 26, 1901. When his parents died, in 1874, he determined to become a gold-miner. He appeared in Deadwood, S. Dak., in 1876, with about \$100 in his pocket, picked up a job as engineer in the mines, and studied mining night and day till he had mastered the business. He went into Alaska on a prospecting tour in the early eighties. He was the first man to hear of the rich Klondike region, and he selected 178 acres of Government land, at \$1.25 an acre, at the confluence of the Klondike and Yukon rivers. On June 23, 1897, he mapped and founded the town of Dawson City on this site, and the town lots, each 50 by 100 feet, brought in many instances \$5,000 each. He also organized the Ladue Gold-Mining and Development Company of Dawson. He returned to the United States in the latter part of 1897. He had contracted consumption in Alaska, and after his return to the States spent the greater part of his time in Colorado Springs, Col.

Lafin, Byron, soldier, born in Lee, Mass., in 1829; died in Hudson, N. Y., June 20, 1901. In early life he was a paper manufacturer, operating with his brother the mills that were conducted later by Warner Miller in Herkimer, N. Y. He enlisted as a captain in the 34th New York Volunteers, and was promoted to be its colonel. At the close of the war he was brevetted major-general of volunteers. After the war he was appointed provisional Governor of North Carolina, and afterward he served as a member of the Legislature of that State.

Lambert, Edgar L., engineer, born in Alexandria, Va., in 1838; died in New Orleans, La.,

Feb. 13, 1901. During the early years of the civil war he served as lieutenant-colonel of the 8th Virginia Regiment, and he was severely wounded in the Shenandoah valley campaign. After his recovery he was appointed lieutenant in the Confederate navy, and stationed at Mobile. In the battle of Mobile Bay he ran the Selma aground and sank her in order to prevent her capture, and after Farragut's victory he sank the Tuscaloosa in Alabama river. After the war he was appointed to a command under Maximilian in Mexico. He assisted in building the railroad from Mexico to Vera Cruz. When Maximilian was overthrown he returned with the French to France, and remained there till 1870. Returning to the United States as engineer, he assisted in the building of the Texas and Pacific, Missouri, Kansas and Texas, and other Western railroads. After 1893 he was engaged on the survey and plan for the new combination sewerage and drainage system of New Orleans.

Lankenau, John D., capitalist and philanthropist, born in Bremen, Germany, in 1815; died in Philadelphia, Pa., Aug. 30, 1901. He removed to the United States when nineteen years old, to accept a place with a firm of dry-goods importers by whom he had been employed in his native town. He afterward became a member of the firm, and, amassing a fortune, retired in 1865. In 1848 he had married Mary Joanna Drexel, a daughter of Francis M. Drexel. He was named as one of his father-in-law's executors, and the management of the Drexel estate eventually fell entirely into Mr. Lankenau's hands. The work of carrying out the provisions of Francis M. Drexel's will extended over many years, and occupied the executor's attention until his death. Mr. Lankenau succeeded Mr. Drexel on the Board of Trustees of the German Hospital, and was its president after 1869. He was chairman of the commission in charge of the German exhibit at the Centennial Exposition in 1876, and received a decoration from Emperor William I. He established the Mary J. Drexel Home for Aged and Homeless Patients of the German Hospital, and was a liberal contributor to many institutions and charities.

Lawson, John, engineer, born in Manchester, England, Aug. 8, 1805; died in St. Louis, Mo., Nov. 21, 1901. When still a boy he was apprenticed to George Stephenson, the inventor of the locomotive, and under his direction built the first engine. Soon afterward he came to the United States, and for many years he served as a locomotive engineer on various railroads in the East and South. He later engaged in the steamboat business, residing in Paducah, Ky., for fifty-six years. He made a fortune out of the Cumberland river trade.

Leary, Richard Phillips, naval officer, born in Baltimore, Md., Nov. 3, 1842; died in Chelsea, Mass., Dec. 27, 1901. He was graduated at the Naval Academy in 1860, and received successively the following commissions: Ensign, Oct. 1, 1863; master, May 10, 1866; lieutenant, Feb. 21, 1867; lieutenant-commander, March 12, 1868; commander, June 2, 1882; and captain, April 6, 1897. He was attached to the blockading squadron off Charleston from 1863 to 1865, was aboard the Canandaigua on the European station from 1865 to 1868, on the Dictator with the North Atlantic fleet from 1870 to 1873, on the Constellation on special service in 1879, on the Pacific station on the Pensacola from 1879 to 1881, and on the Vandalia on the North Atlantic station from 1881 to 1882. After his appointment as commander, in the latter year, he commanded suc-

cessively the Wyandotte, the Iroquois, and the Adams. On the latter ship he first attracted public notice by his attitude during the Samoan revolution of 1888. In September of that year the commander of the German cruiser Adler threatened to bombard a native fort unless it was evacuated by the adherents of Mataafa. The Germans were supporting Tamasese. Leary was in command of the little Adams, a third-rate vessel of antique type, and, finding the Germans about to interfere forcibly in support of their candidate for the Samoan chieftainship, he cleared ship for action, first placing his vessel in position to command the approaches to the fort, and forbade any interference. He also landed marines to protect the American consulate. He remained at his post until the American squadron, under Admiral Kimberly, arrived, when he was sent north in the Adams. For this service the Maryland Legislature voted him a gold medal. He commanded the San Francisco after September, 1897, and in the West Indies campaign of the Spanish-American War; and after the war he was stationed at the Boston Navy-Yard till April, 1899, when he was appointed the first naval Governor of Guam. On the island he was in absolute authority. He carried his government in his ship, the Yosemite, and had to execute as well as judge of the laws. He ruled the island as he would his ship, breaking up immorality by obliging the natives to marry, calling upon the men for a certain amount of work every week, and even prescribing the minimum number of poultry which should be maintained in each family. He secured the respect and affection of the natives. In the spring of 1900 he was replaced by Commander Seaton Schroeder. He was then assigned to the League Island Navy-Yard, and on Dec. 6, 1900, to the command of the receiving-ship Richmond. He was relieved of the command of the Richmond, at Boston, in October, 1901, on account of heart trouble. About two weeks before his death he made application for his retirement as a rear-admiral. The application was approved by the examining board and the President the day before his death, but for some unknown reason the letter of the Secretary of the Navy, announcing to him his promotion and retirement, was not mailed in Washington until Dec. 30.

Leavenworth, Abel E., educator, born in Charlotte, Vt., in 1828; died in Castleton, Vt., June 3, 1901. He was graduated at the University of Vermont in 1852, and became principal of Bolivar (Mo.) Academy. In 1855 he took charge of Hinesburg (Vt.) Academy, and in 1859 he became editor and proprietor of the State School Journal, continuing as such and as principal of West Brattleboro Academy till May, 1862, when he enlisted as sergeant in the 9th Vermont Volunteers. He was appointed captain in December, 1864, and after June, 1863, was assistant inspector-general of Wistar's brigade, and assistant adjutant-general till early in 1865. After the war he again became principal of Hinesburg Academy, and later of Beaman Academy. In December, 1874, he took charge of the Normal school at Randolph, Vt., and in 1881 of Castleton Seminary and Normal School. For two years he was president of the Teachers' Association of Vermont.

Leavitt, Andrew Jackson, actor, born in Boston, Mass., in 1822; died in that city, Feb. 1, 1901. He made his first appearance with an amateur dramatic club in Albany, N. Y., as Cool in London Assurance. His first professional appearance was with a minstrel company, and he was a popular favorite as end-man and comedian. He became proprietor and manager of a small

minstrel house in Boston, and then built the Green Street, Boston, which he managed successfully for a time. Reverses came to him to active work in other theaters in New York and produced a clear success. The Happy Land of Canaan, which won his reputation as a sketch-writer, and engagements in Philadelphia, New Orleans, and other large cities, he finally settled in Boston, where he played ten years in negro farces at the Hollis Athenæum. A few years ago he appeared again in legitimate drama, his last engagement being in The Two Sisters. In 1891 he became the stage-doorkeeper at the Hollis Street Theater, Boston, where he remained up to the time of his death.

Le Brun, Napoleon Eugene Charles Henry, architect, born of French parents at Philadelphia, Pa., Jan. 2, 1821; died in New York city, July 9, 1901. He studied architecture in the office of Thomas U. Walter, and in 1842 began the practice of his profession in his native city, where he designed the Roman Catholic cathedral, the Academy of Music, and other buildings of note. About 1861 he removed to New York city, where with his son he designed the Masonic Temple, the New York Foundling Asylum, the Metropolitan Life Insurance building in Madison Square, and other notable structures.

Le Conte, Joseph, geologist, born in Liberty County, Georgia, Feb. 26, 1823; died in Yosemite valley, California, July 6, 1901. He was descended from Guillaume Le Conte, a Huguenot, who fled from Rouen after the revocation of the Edict of Nantes and settled in New Rochelle, N. Y., in 1698. Lewis, a grandson of Guillaume, after graduation at Columbia in 1799, settled in Liberty County, Georgia, where his sons John and Joseph were born. Joseph was graduated at Franklin College of the University of Georgia in 1841, and at the College of Physicians and Surgeons

in 1845. He entered on the practice of medicine in Macon, Ga., but abandoned his profession to enter Lawrence Scientific School of Harvard, where he studied natural sciences and geology under Louis Agassiz, receiving the degree of B. S. in 1851, and during that year he spent some time with Agassiz exploring the reefs and keys of Florida. In 1852 he was chosen to the chair of Natural Science in Oglethorpe College, but a year later resigned to accept the professorship of Geology and Natural Science in the University of Georgia, where his brother John was Professor of Natural Philosophy. He retired from this university in 1856 to become Professor of Geology and Natural History in South Carolina College, where he remained until 1862, when, owing to the civil war, college work was abandoned, and he was for a time engaged as chemist in the Government laboratory for the manufacture of medicines, and later as chemist in the niter and mining bureau in Columbia. In 1866 he returned to his professorial duties in the University of South Carolina, but two years later he joined the original faculty of the University of California, becoming Professor of Geology, Botany, and Natural History, which chair he then held until his death. His scientific work included researches on the phenomena of binocular vision and many

important contributions to geology, especially of the Pacific slope, where he was the first to determine the age and character of the Cascade mountains, and their relation to the great Columbia lava flood. He described the ancient glaciers of the Sierra Nevada, and was among the first to recognize the post-tertiary elevation of those mountains, as shown by the river-beds. His studies on mountain structure led him to important generalizations on the origin of mountains in general, and he became one of the chief exponents of the "contractional theory" of mountain building. His studies on ore deposition at Steamboat Springs, Nev., and Sulphur Bank, Cal., led him to a discussion of vein-formation in general, and his classification of ore deposits is not displaced in its essential features by the most recent work in the same direction. He also made important contributions to the subjects of seismology and coral growth in geological aspects. Prof. Le Conte was an advocate of the doctrine of evolution. He was also interested in art. The degree of LL. D. was conferred upon him in 1879 by the University of Georgia, and he was a member of many scientific societies, including the National Academy of Sciences, to which he was chosen in 1875. Besides being one of the editors of the *Journal of Geology* and of *Science*, he was a large contributor to popular scientific and technical journals, as well as author of the following: *Religion and Science*, a series of Sunday lectures (New York, 1873); *Elements of Geology* (1878); *Sight: An Exposition of the Principles of Monocular and Binocular Vision* (1880); *Compend of Geology* (1884); and *Evolution: Its Nature, its Evidences, and its Relation to Religious Thought* (1887).

Leighton, George E., lawyer, born in Cambridge, Mass., in 1835; died in Monadnock, N. H., July 4, 1901. He removed with his father to Cincinnati in 1844, where he received his education, and in 1858 he began the practise of law in St. Louis, Mo. When the civil war broke out he became a lieutenant in the 3d Missouri Infantry. He saw active service in 1861, and then became major of the 5th Missouri Cavalry, but was transferred to the 12th Regiment. In the summer of 1861 he was made provost-marshal of the St. Louis division under Gen. Halleck. He served under and was commended by Gens. Curtis, Schofield, Halleck, Hamilton, and Davidson. He resumed his law practise after the war, but in 1874 gave it up for commercial pursuits. He was afterward connected with many notable manufacturing and financial interests. He was president of the Monetary Conference in Indianapolis in 1897, and was appointed by the executive committee a member of the Monetary Commission. He delivered a speech in opposition to the free coinage of silver at the Trans-Missouri Conference, of which 150,000 copies were printed and circulated. He gave much attention to public education, and after 1876 was a trustee of Washington University. His library was the largest private library in St. Louis, and was a paradise for bibliophiles. It was especially rich in history of the Mississippi valley. He was a founder of the National Arts Society. He was president of the Missouri Historical Society twelve years, and a member of the Academy of Science.

Lenihan, Thomas Mathias, Roman Catholic bishop, born in Mallow, Ireland, Aug. 12, 1844; died in Marshalltown, Iowa, Dec. 15, 1901. He was educated at Bardstown, Ky., the Ecclesiastical Seminary of Cape Girardeau, Mo., and the St. Francis Seminary of Milwaukee, and was ordained Nov. 19, 1867. He was pastor of St. Bene-

dict's Church, Decorah, Iowa, from 1868 to 1870. Later he had charge of Corpus Christi Church, Fort Dodge, Iowa, and adjacent missions. In its vicinity he established many new churches and parishes. He was made irremovable rector and dean, in which capacity he served till consecrated Bishop of Cheyenne, Wyo., Feb. 24, 1897.

Lewis, Charles N., actor, born in Seneca Falls, N. Y., Sept. 14 1819; died in Pokagon, Mich., Jan. 25, 1901. He first appeared on the stage in Utica, N. Y. Later he supported Edwin Forrest, William Knight, Adah Isaacs Menken, and others. Mr. Lewis is said to have opened the first theater in Chicago, at the corner of Lake and Dearborn Streets, in 1842. He retired from the stage in 1868.

Linsley, Joseph Hatch, bacteriologist, born in Windsor, Vt., May 29, 1859; died in Burlington, Vt., Feb. 17, 1901. He was graduated at the University of Vermont, in the medical department, in 1880, and served as lecturer on physiology and instructor in microscopy and chemistry in that institution. He was city physician of Burlington from 1881 to 1884, and from 1885 to 1888 he served as health-officer. He was then appointed instructor in clinical microscopy in the New York Post-Graduate Medical School and Hospital, and a year later he was made director of the laboratories of histology, pathology, and bacteriology, doing in addition the pathological work of St. Luke's and the Presbyterian Hospitals. In 1890 he went to Berlin and took a course in bacteriology under Koch. Again he went to Germany as representative for the New York Post-Graduate School to obtain some of Koch's lymph, and on his return he gave the first address on the lymph treatment for tuberculosis in the Academy of Medicine before the Medical Society of the County of New York. Later he was made Professor of Bacteriology and Pathology in the University of Vermont, and in connection with his instruction in that institution he did his greatest work in the upbuilding of the Vermont State Laboratory of Hygiene. In 1897 Dr. Linsley opened a small laboratory for the examination of cultures for suspected diphtheria and typhoid-fever cases, and in 1898 the State created a bacteriological laboratory, and placed him at its head. During his incumbency more than 11,300 examinations were made of specimens of food products and of cases of contagious and infectious diseases.

Littlejohn, Abram Newkirk, clergyman, born in Florida, N. Y., Dec. 13, 1824; died in Williamstown, Mass., Aug. 3, 1901. He was educated at Union College, studied theology, and entered the Protestant Episcopal ministry, taking priest's orders in 1849. After short rectorships at Amsterdam, N. Y., Meriden, Conn., and Springfield, Mass., he became rector of St. Paul's Church, New Haven, Conn., in 1851, remaining there nine years, and for seven years of that period holding the post of lecturer on pastoral theology at Berkeley Divinity School, Middletown, Conn. From 1860 to 1868 he was rector of Holy Trinity Church, Brooklyn, N. Y. In the last-named year he was elected bishop of the newly formed diocese of Central New York, but before official notice of the event had been received the first convention of the diocese of Long Island elected him bishop of that diocese also. He accepted the latter honor, and was consecrated in January, 1869. Between 1874 and 1886 he was also spiritual overseer of all the American Episcopal churches on the Continent of Europe. The degree of D. D. was given to him by the University of Pennsylvania in 1856, and

the University of Cambridge, England, conferred the honor of LL. D. upon him in 1884. The bishop was the author of *Conciones ad Clerum* (1880); *Individualism: Discourses before the University of Cambridge* (1880); and *The Christian Ministry at the Close of the Nineteenth Century* (1884).

Lorillard, Pierre, tobacco manufacturer, born in New York city, Oct. 13, 1833; died there, July 7, 1901. With his four brothers he inherited the tobacco business from his father, and, buying them out, developed it with great success. He owned the schooner *Vesta*, and was one of the crew that raced her from Sandy Hook to Cowes for a sweepstake of \$10,000. His colt *Iroquois* won the English Derby in 1881, and he was the only American that ever won that event with an American-bred horse. Mr. Lorillard left fine stables in England and on his breeding-farm at Rancocas, N. J. He founded the colony of Tuxedo on land of his in the Ramapo hills. He was interested with the French Government in fitting out the two Charnay Franco-American archeological expeditions to explore the ancient cities of Central America and Yucatan, and France, as a reward for his generosity, made him an officer of the Legion of Honor.

Luby, Thomas Clarke, Irish patriot, born in Dublin, Ireland, Jan. 15, 1822; died in Jersey City, N. J., Nov. 28, 1901. He was graduated at Trinity College, Dublin, in 1840, and studied law at the Temple, London, but chose journalism as his profession. He early associated himself with the Irish National cause, and joined his fortunes with James Stephens in the organization of the Fenian movement. Stephens and Luby met in Dublin and administered the oath to each other as leaders of the cause. Mr. Luby came to the United States in 1863, and as a result of this visit the American branch was subordinated to the home organization, and so remained until its disruption in 1866. In 1864 the Irish People was established in Dublin, and Mr. Luby became its managing editor. John O'Leary was editor-in-chief. The paper was ultimately suppressed by the British Government. Mr. Luby was arrested, tried, and convicted of treason-felony, and sentenced to twenty years' imprisonment. He served five years of the term, and in December, 1870, was pardoned under Mr. Gladstone's Constitutional Amnesty bill, on condition that he should go abroad for the remainder of the prescribed term. He first went to the Continent, and then came to the United States, where he afterward made his home. He was widely known as an author and lecturer, his best-known books being *The Life of Daniel O'Connell* and *The Lives of Illustrious and Representative Irishmen*. He withdrew from the Irish movement in 1880 on account of his hearty disapproval of the dynamite doctrine of the O'Donovan Rossa group of Nationalists, and he denounced, whenever opportunity offered, the Phoenix Park murders.

Ludlow, William, soldier, born in Islip, N. Y., Nov. 27, 1843; died in Convent, N. J., Aug. 30, 1901. He was graduated at West Point in 1864, was commissioned 1st lieutenant of engineers, became chief engineer, and was assigned to duty with the 20th Army Corps, under Gen. Hooker, then engaged in the campaign around Atlanta. Lieut. Ludlow joined the command the day before the battle of Peach Tree Creek, and was in most of the subsequent battles of the campaign. He was chief engineer of the left wing of the Army of Georgia on the march to the sea and in the Carolina campaign. He was brevetted captain, July 20, 1864, for gallant and meritorious services in the defense of Allatoona Pass; major,

Dec. 21, 1864, for meritorious services in the Georgia campaign; and brevetted lieutenant-colonel, March 13, 1865, for gallant and meritorious services in the campaign of the Carolina. He was promoted to advancement in the regular army as follows: Captain, March 7, 1867; major, Aug. 30, 1882; lieutenant-colonel, Aug. 12, 1883; brigadier-general, Jan. 21, 1900. He was engaged in organizing the engineer depot at Jefferson Barracks, Missouri, and was in command of the 1st and 2d regiments of engineers, and Company E of the engineer battalion stationed there in 1866. He was also at the same time in charge of the engineer property in Missouri and Arkansas. From 1867 to 1872 he was assistant to Gen. Gillmore and in charge of the fortifications and river and harbor work at New York city and along the South Atlantic coast. Then from Nov. 10, 1872, to May 9, 1876, he was chief engineer of the Department of Dakota. June 30, 1882, he was appointed major of the Corps of Engineers. He served as engineer secretary of the Lighthouse Board from Aug. 28, 1882, to March 8, 1883. From 1883 to 1886 he was chief engineer of the Philadelphia Water Department. For two years following 1888 he was engineer commissioner of the District of Columbia, and from 1888 to 1893 in charge of the river and harbor and lighthouse work on the Great Lakes. From 1893 to 1896 he was military *attaché* to the United States embassy in London. In 1895 he was president of the United States commission sent to report upon the feasibility of the Nicaragua Canal route, which finished its work in November. From 1897 to 1898 he was in charge of the river and harbor fortifications at New York. At the outbreak of the Spanish War he was appointed brigadier-general of volunteers. At the attack upon Santiago he was in command of the 1st Brigade of Lawton's division, and he was commended for his services at the battle of El Caney. On Sept. 8, 1898, he was promoted major-general of volunteers, and assigned to the command of the 2d Division of the 1st Army Corps. In December of the same year he was appointed military governor of Havana. In this latter capacity he had to assume much of the responsibility attached to the rehabilitation of the Cuban capital. In April, 1900, he was ordered to resume his duties as president of the board of officers appointed to consider the establishment of a war college for the army. In connection with this service he went abroad to study the organization of the French and German general army staffs. In February, 1901, he was ordered to the Philippines to command the department of Visayas. Owing to his illness, on April 26, his appointment was revoked and he was ordered home.

Lund, Unni, singer, born in Christiania, Norway, in 1866; died in Syracuse, N. Y., Nov. 16, 1901. She studied under French teachers, removed to Oswego, N. Y., in 1887, and the following year to New York city, where she was introduced to musical circles in a concert given by William Sherwood in Chickering Hall. For a time she studied in New York city with George Sweet, at the same time teaching in St. John's Episcopal School, Tarrytown, and singing in churches. In 1893 she became the head of the vocal department of Syracuse University. She was well known as a concert singer.

Lyall, James, inventor, born in Auchteradar, Scotland, Sept. 13, 1836; died in New York city, Aug. 23, 1901. He was brought to the United States when three years old, and worked in his father's shop at making Jacquard looms. He enlisted in the 12th New York Infantry and took

part in the defense of Washington in the early part of the civil war. He afterward established mills for the manufacture of cotton and jute goods and of milling machinery, and manufactured the first machine-made corsets in the world, designing much of the machinery. In 1863 he invented a varnish for waterproofing the cloth of knapsacks, which was approved by the Government, and led to his receiving large contracts for knapsacks and haversacks. In 1868 he invented the Lyall positive-motion loom, which revolutionized the manufacture of cotton goods. He also invented a cap press for compressing the cotton on the shuttles, and many other attachments and devices that are largely used in cotton-goods manufacturing. He received the gold medal of honor from the American Institute in 1869, and other medals and decorations.

Lyman, Henry Harrison, New York State commissioner of excise, born in Lorrain, N. Y., April 15, 1841; died in Oswego, N. Y., May 4, 1901. He was graduated at Pulaski Academy, studied civil engineering, and practised about three years. In 1862 he enlisted as a private in the 147th New York Volunteers. He served with distinction during the war, and when captured, in May, 1864, was adjutant of his regiment. He was in Confederate prisons ten months. When mustered out at the close of the war he was made a lieutenant-colonel of militia. Returning to Oswego at the close of the war, he engaged in banking. He held various town offices, and in 1872 was elected sheriff of Oswego County, serving three years. In 1889 he was made collector of the port of Oswego, which office he held till 1895, when he was appointed a member of the Forest, Fish, and Game Commission. The financial ability that he displayed in reorganizing the accounts of the Fish Commission, which were greatly disordered, led to his appointment as State commissioner of excise, March 30, 1896.

Lynch, James C., soldier, born in Waterbury, Conn., in 1840; died in Philadelphia, Pa., April 12, 1901. In August, 1861, he became 2d lieutenant in the 106th Pennsylvania Regiment. He was appointed 1st lieutenant in January, 1862, and became a captain one year later. In June, 1863, Capt. Lynch, at that time inspector-general of the division, was assigned to the command of the 183d Pennsylvania. He was mustered out in October, 1864, and at the close of the war was brevetted brigadier-general.

Lyon, Appleton Park, botanist, born in Erie, Pa., June 12, 1840; died in Mount Vernon, N. Y., Nov. 27, 1901. At the age of sixteen he became a tutor in a normal school in Lebanon, Ohio, and later Professor of Mathematics in the same school. He also studied at Brown, at Amherst, and at Union Theological Seminary. He was an ardent student of nature from his boyhood, and was the friend and adviser of students and botanists in all parts of the country. His library, which for many years was in Fifth Avenue, New York, just off Madison Square, was one of the best botanical libraries in the United States and was much used for reference. At his death, besides containing 22,000 books and pamphlets, it had a collection of 265,000 classified pictures of plants, with the texts, which it took Prof. Lyon and his wife twelve years to compile.

McAdam, David, jurist, born in New York city, Oct. 6, 1838; died there, Dec. 22, 1901. He attended the public schools, studied law, and in 1859 was admitted to the bar. He practised till 1873, when he was elected to the bench of the Marine Court, his term beginning in 1874. In 1879 he was renominated, and was the only Tam-

many nominee elected, running more than 15,000 votes ahead of his ticket. In 1885 he was returned to this tribunal, its name having been changed in 1882 to the City Court. He was elected by his associates chief justice of the court, and sat till 1890, when he was elected to the Superior Court. He filled this post till Dec. 31, 1895, when, by the new State Constitution, the Superior Court judges were made justices of the Supreme Court. His term would have expired Dec. 31, 1904. His decisions were noted for their conservatism and broad common sense rather than brilliance. For thirty years Justice McAdam, in good and ill health, did not miss a day and was not late in attendance on his courts. He was the author of law works, among them *Marine Court Practise* (1868, 1872); *Landlord and Tenant* (1875, 1882, 1900); *The Stillwell Act*; and *McAdam on Names*. A short time previously to his death he had completed, but had not yet published, an exhaustive work on *The Law of Negligence, as Applied to the Relations of Landlord and Tenant*. He was also popular as a lecturer, his best-known lectures being on *Character, George Washington, Lincoln and Grant, Robert Burns, Legal Chestnuts, and Lawyers, Wise and Otherwise*.

McClurg, Alexander Caldwell, publisher, born in Philadelphia, Pa., about 1834; died in St. Augustine, Fla., April 15, 1901. He was graduated at Miami University, Oxford, Ohio, in 1853; studied law in Pittsburg; and finally went to Chicago, where he became a clerk in the book-selling house of S. C. Griggs & Co. Aug. 15, 1862, he enlisted as a private, and soon afterward was made a captain in the 88th Illinois Infantry. Later he was made lieutenant-colonel in the adjutant-general's department, and chief-of-staff of the 14th Army Corps, and was brevetted colonel and brigadier-general. He participated in the battles of Perryville, Stone River, Chickamauga, Missionary Ridge, and Atlanta, and in the march to the sea. After the war he became a partner in the firm of S. C. Griggs & Co., afterward Jansen, McClurg & Co., and finally succeeded by A. C. McClurg & Co., of which he was the head, and which he made one of the largest book-distributing houses in the United States. On Feb. 12, 1899, the building and the entire stock, including many rare and valuable books and manuscripts, were destroyed by fire. Gen. McClurg then wished to retire, but he was persuaded to reorganize the house on cooperative lines, with a capital stock of \$600,000, mostly subscribed by its old employees, and to become president of the new concern. He was a frequent contributor to magazines, and he received the degree of A. M. from Yale in 1893.

McComb, James Jennings, business man, born in Mansfield, Ohio, Jan. 22, 1829; died in Dobbs Ferry, N. Y., March 31, 1901. He went to California in 1849, and, though successful there, not liking the life of the gold-fields, he returned to the East, where he became identified with the cotton business. He was the inventor of the arrow cotton tie, a simple device for use in the baling of cotton, which became immediately popular in the Southern States and brought him a large fortune. From 1861 till 1876 he resided in England. He afterward resided in New York city, and after 1881 at Dobbs Ferry. After his return to the United States he was engaged in many large business enterprises in New York city, and he was the owner of the Navarro apartment houses, Central Park South, having obtained the title upon the failure of the persons who were interested in their erection. Mr. Mc-

Comb gave largely to, and took an active interest in, many charities. One of his notable gifts was \$50,000 to the Southwestern Presbyterian University, Clarksville, Tenn.

McDonald, William, Methodist Episcopal clergyman, born in Belmont, Me., March 1, 1820; died in West Somerville, Mass., Sept. 11, 1901. He was educated in the common schools, and received the degree of D.D. from Upper Iowa University in 1887. He was apprenticed to the painting trade, but entered the ministry in 1840, and in 1843 connected himself with the Maine Conference. He had charges in Lincoln, 1843; Oldtown, 1844; Searsmont, 1845; Cherryfield, 1846; South Berwick, 1847; Salmon Falls, 1848; Chestnut Street Church, Portland, 1849-'50; Biddeford, 1851-'52; and Congress Street, Portland, 1853. During 1854 he was the representative of a tract society. In the summer of 1855 he preached in Minneapolis, Minn., and then in Appleton, Wis. He then supplied the pulpit of Haverhill Street Church, Lawrence, Mass.; was pastor of Clark Memorial Church, Portland, in 1858; organized Trinity M. E. Church, Providence, R. I., in 1859; and held the following pastorates in order: New Bedford, Mass., 1860-'61; Chestnut Street Church, Providence, 1862-'64; Grace Church, Boston, 1866-'69; East Boston, 1869; and Brooklyn, N. Y., 1870-'71. While in Boston he had been elected a member and vice-president of the National Camp-Meeting Association, which office he held sixteen years, succeeding to the presidency upon the death of the Rev. J. S. Inskip, and continuing as its president for twelve years. With the latter he engaged in evangelistic work. They visited England twice, and in 1880 extended the trip to India, Australia, and the Holy Land. They made 12 evangelistic trips from the Atlantic to the Pacific, preaching in 21 States, the first time carrying with them a large tent in which to hold services. In 1870 Dr. McDonald was made editor of the *Advocate of Holiness* (changed to *Christian Witness* in 1883), and he was at its head for about twenty-five years. He also held brief pastorates in Boston, Brookline, and Auburndale in his later years. He was the author of *History of Methodism in Providence, R. I.*; *Spiritualism Identified with Ancient Sorcery*; *New Testament Demonology and Modern Witchcraft*; *After Death, What?*; *Scripture Way of Holiness*; *Saved to the Uttermost*; *Wesley and his Doctrine*; *Another Comforter*; *The People's Wesley*; and *Life of Rev. Alfred Cookman*.

Macfeely, Robert, soldier, born in Pennsylvania, July 1, 1826; died in Washington, D. C., Feb. 22, 1901. He was graduated at West Point in 1852, was made 2d lieutenant in the 4th Infantry, in which Ulysses S. Grant was then a captain. In the same year the regiment was ordered to the Pacific coast by way of the Isthmus of Panama, and in the Bay of Panama cholera decimated the command. He served in California and southern Oregon, and was finally stationed at Fort Vancouver, Washington, the headquarters of his regiment. He was made 1st lieutenant, May 31, 1855, and accompanied the early expedition in the Oregon Indian war that began in 1856. On this expedition he attracted attention by his efficiency as a quartermaster and commissary, and on May 13, 1861, he was transferred to the commissary-general's department, with the rank of captain. He served throughout the civil war, receiving the rank of major, Feb. 9, 1863, and March 13, 1865, he was brevetted colonel for faithful and meritorious service. After the war he was chief commissary of Gen. Sheridan's division of the Missouri. On April 14, 1875, he

was appointed brigadier-general and commissary-general of subsistence. He retired July 1, 1890.

Mackay, Andrew J., soldier, born in Caledonia, N. Y., in 1826; died in New York city, Jan. 18, 1901. Before the war he owned a large ranch in Texas, and furnished the regular army with supplies. He was on his way back to Texas in 1861, when Gen. Thomas warned him not to be unsafe for him to return thither. The offer Gen. Thomas made him to appoint him a captain and quartermaster of volunteers and assign him to his own staff was accepted. He served through the war, and was in all the battles in which Thomas's forces were engaged. He was promoted for meritorious service to major, lieutenant-colonel, colonel, and brevet brigadier-general of volunteers. After the war he was interested in the milling business in Minnesota. He afterward had a stock ranch in Nebraska, and then removed to New York.

McKeever, Chauncey, soldier, born in Maryland in 1828; died near Emden, Germany, Sept. 5, 1901. He was graduated at West Point in 1849, and assigned to the 1st Artillery as brevet 2d lieutenant. He was commissioned 2d lieutenant, 3d Artillery, July 27, 1850, and 1st lieutenant, Dec. 24, 1853. Previously to the civil war he was engaged chiefly in frontier duty. July 1, 1861, he was brevetted captain and appointed assistant adjutant-general. He was commissioned captain and assistant adjutant-general, Aug. 3, 1861; major, July 17, 1862; lieutenant-colonel, March 3, 1875; and colonel, Feb. 28, 1887. He was brevetted lieutenant-colonel, Sept. 24, 1864, and colonel and brigadier-general, March 13, 1865, for diligent, faithful, and meritorious services in the adjutant-general's department.

McKellar, Archibald, sculptor, born in Paisley, Scotland, Oct. 23, 1844; died in Bridgeport, Conn., July 4, 1901. He removed to New York city when nineteen years old, and engaged with a firm that made a specialty of metal monuments. His work at once attracted attention. Shortly after the Monumental Bronze Company was formed, about 1880, Mr. McKellar was secured as its sculptor, and removed to Bridgeport. At the time of his death he was superintendent and a director of the company. An immense amount of work came from his hand, and there is scarcely a city of any importance in Europe or America where a piece of his work is not to be found. His statue of James A. Garfield, in bronze, at Wilmington, Del., was chosen in competition, and won for him high praise from the critics and from the family of the dead President. His best-known piece, *Defense of the Flag*, has been copied nearly 1,000 times, and his *Liberty, Justice, Peace, and Honor* all show him at his best and won him national fame. His last work, a masterpiece in bronze, was a four-sided pyramid bearing four panels—a soldier, a sailor, *Liberty*, and the *All-seeing Eye*—erected in Newport, R. I.

McMahon, James, clergyman, born in Ireland in 1837; died in Washington, D. C., April 15, 1901. He was a cousin of Marshal McMahon of France, and after his graduation at the college of Maynooth studied at the Seminary of St. Sulpice, in Paris, and later in Montreal. He also received a musical education, and while in Paris was an organist and a member of an army band. In 1843 he was appointed assistant to the Rev. William Starrs, in St. Mary's Church, New York city. In 1850 he was made pastor of the Church of St. John the Evangelist, which then owned the property upon which St. Patrick's Cathedral now stands. When St. John's was removed to

make way for the building of the cathedral, Father McMahon was placed in charge of the work on the new structure. In 1875 he became pastor of St. Andrew's Church, in Duane Street. In his early days he bought property in upper New York city that afterward largely increased in value. He gave liberally to all the churches with which he was connected, and in 1891 presented to the Catholic University in Washington real estate, chiefly in New York city and Long Branch, N. J., valued at more than \$500,000, with a part of which gift was built McMahon Hall. In consideration of his liberality and his interest in the university, the Pope conferred upon him the title of Monsignor. Father McMahon retired from active duties in the early nineties, and afterward made his home at the university. In 1848 he published a translation of the New Testament based on Challoner's revision of the old Douay Bible, and while pastor of St. John's he planned and superintended the construction of a great pipe-organ.

McQueen, Georgianna M., missionary, born in Longmeadow, Mass., Jan. 6, 1827; died there, Feb. 18, 1901. She was graduated at Mount Holyoke Seminary in 1847, and taught in West Liberty, Va., Harmer, Ohio, Schenectady, N. Y., and Easton, Pa. In 1855 she took passage in a sailing ship for the island of Corisco, western Africa, where, on July 22 of that year, she married the Rev. George McQueen, a missionary. They came to the United States for a short furlough in 1857, and returned to Corisco the following year, leaving their infant son with his grandparents in Longmeadow. In 1859 Mr. McQueen died of coast fever, and, although Mrs. McQueen came to this country for a visit after her husband's death, she returned to Africa and continued her labors till 1865. For many years she was secretary and treasurer of the Longmeadow Historical Society.

McVickar, William Bard, lawyer, born in Irvington-on-Hudson, Oct. 14, 1858; died in Morristown, N. J., March 30, 1901. He was a son of the Rev. William A. McVickar, who for many years was in charge of the Protestant Episcopal church in Nice, France. Mr. McVickar was graduated at Columbia University in 1880, and at the Columbia Law School, and was admitted to the bar in 1882. He studied law in the office of the late Stephen P. Nash, and for several years he was associated with John E. Parsons in the practice of law. In 1897 he organized the firm of Marshall, Moran, Williams & McVickar. Mr. McVickar was a contributor to *Life* and other periodicals, and had published a book of poems entitled *Lays of a Lawyer*.

Magee, Christopher Lyman, politician, born in Pittsburg, Pa., April 14, 1848; died there, March 8, 1901. He studied in the Western University of Pennsylvania, but became a clerk in the office of the comptroller of Pittsburg. His genius for politics and efficiency in official duty secured for him in 1869 the cashiership of the city treasury. Two years later he was elected city treasurer on the Republican ticket, receiving 2,600 more votes than the party's candidate for mayor. He was reelected with three times the majority given at his first election. In 1896 he was nominated for State Senator by both parties, and elected. He was one of the 306 in the convention of 1880 in favor of Gen. Grant's nomination for a third term. Mr. Magee early became interested in the development of natural gas, from which he reaped rich returns, and by employing the money thus acquired laid the foundation of his large fortune. He was largely concerned in the ownership and management of street-railways in

Pittsburg. In 1884 Mr. Magee purchased the *Pittsburg Times*, which he developed into an influential journal, and in 1896 he founded the *Daily News*. He was a trustee or director of many educational and public institutions, and erected for the city of Pittsburg the buildings for the zoological gardens in Highland Park at a cost of \$125,000.

Manly, George E., diplomat, born in Franklin, Tenn., in 1825; died in Washington, D. C., Feb. 9, 1901. After he was graduated at the University of Tennessee, he served in the Mexican War, and at the beginning of the civil war he became 1st lieutenant in the 1st Tennessee Regiment. He participated in the battles of Bull Run, Shiloh, and Chickamauga, and retired at Appomattox with the rank of brigadier-general. When Gen. Grant was nominated for the presidency, he joined the Republican party, and was afterward identified with nearly every campaign. He was delegate-at-large from Tennessee to the national conventions of 1880 and 1888, and he was appointed minister to Colombia by President Garfield and minister to Uruguay and Paraguay by President Harrison.

Markoe, Thomas Masters, surgeon, born in Philadelphia, Pa., Sept. 13, 1819; died in East Hampton, N. Y., Aug. 26, 1901. He was graduated at Princeton in 1836, and at the New York College of Physicians and Surgeons in 1841. In 1839 he became a junior assistant in the New York Hospital, and, with the exception of a short period immediately after his graduation, when he served as Professor of Anatomy in Castleton Medical College, Vermont, and from 1852 to 1854 as Professor of Pathological Anatomy in the University of the City of New York, he was connected with that hospital till his death. He became assistant curator in the Pathological Museum and lecturer on pathological anatomy. From 1852 to 1892 he was attending surgeon, and thereafter consulting surgeon. From 1860 he was a professor in the College of Physicians and Surgeons, till 1870 adjunct Professor of Surgery, from 1870 to 1879 full professor, and from 1879 to 1890 Professor of the Principles of Surgery. At various times he served as attending surgeon to the Nursery and Child's Hospital, the Mount Sinai, Bellevue, and Roosevelt Hospitals, and also as consulting surgeon at Mount Sinai, Woman's, Roosevelt, Orthopedic, St. Mary's, Vassar, and the Nursery and Child's Hospitals and the Northern Dispensary. During the civil war Dr. Markoe served as volunteer surgeon at Fort Monroe, as one of the Board of Examiners of Contract Physicians and Surgeons in 1862, and as visiting surgeon to the New York soldiers' depot, in Howard Street, in 1863. In 1864 he was ordered to Fredericksburg, and later to Belle Plain.

Marsh, Mrs. Caroline Crane, author, born in Berkley, Mass., Dec. 1, 1816; died in Scarsdale, N. Y., Oct. 27, 1901. In 1838 she married George Perkins Marsh, the first United States minister to Italy, and prior to that minister to Turkey. She published in 1857 *The Halig*, or *The Sheepfold in the Water*, a tale of humble life on the Schleswig coast, from the German of Biernatzki, with a biography of the author, and in 1860 *Wolfe of the Knoll*, and *Other Poems*.

Marsh, Lucius Bolles, merchant, born in Danvers, Mass., April 18, 1818; died at North Scituate Beach, Massachusetts, Aug. 14, 1901. He entered a bookstore in Boston when fourteen years old, and fifteen months later accepted employment with Cushing, White & Co., woolen importers. He became a member of the firm in

1839, but retired from it one year later. After various connections he became a partner in 1846 in the firm that was finally known as Marsh, Talbot & Wilmarth. Mr. Marsh retired from business Dec. 31, 1870. In 1862 he recruited the 47th Massachusetts Regiment, known as the Merchant Guard, and on Oct. 30 was made its colonel. He commanded part of Gen. Banks's expedition to New Orleans, and in May, 1863, he received command of the National troops at Camp Parapet. Col. Marsh recruited a company of negroes, which became the nucleus of the 2d Regiment of Engineers. He held this point against a large force of Confederates during the siege of Port Hudson. In his later life he was deeply interested in philanthropic work.

Marshall, John Potter, educator, born in Kingston, N. H., Aug. 11, 1823; died in Medford, Mass., Feb. 5, 1901. He was graduated at Yale in 1844, and for two years thereafter taught in the Baptist Academy, Edinham, N. H. He taught in the Liberal Institute, Lebanon, N. H., for an equal period, and after a short interval of teaching in his native town was invited to the newly established High School in Danvers, Mass., from which he went, in December, 1851, to the High School in Chelsea. Thence he was called in 1854 to become a professor in Tufts College. He was the most active assistant of Dr. Ballou in the organizing of the college, of which he was the first professor appointed. In the beginning he had charge of all the mathematics and science taught, but his duties were afterward limited to the teaching of geology and mineralogy. His small private collection of minerals and fossils, which he brought with him, was the nucleus of the present splendid collections of the college.

Mayo-Smith, Richmond, economist and educator, born in Troy, Ohio, Feb. 9, 1854; died in New York, Nov. 11, 1901. He was graduated at Amherst College in 1875, and studied at the universities of Berlin and Heidelberg from 1875 till 1877. He was appointed assistant in history and political science at Columbia College in 1877; was made adjunct professor in 1878, and Professor of Political Economy and Social Science in 1883. He was also one of the original faculty of the Columbia School of Political Science established for graduate instruction and research work in 1880. His chief work as a teacher was with graduate students in this school, and his special subject was statistics, in which field he was regarded as the highest academic authority in the United States. Men trained by him occupy chairs of political economy at Harvard, Yale, Cornell, and other American universities; others are active as statisticians in the Federal and State service. He was an honorary fellow of the Royal Statistical Society of Great Britain, a member of the International Statistical Institute, and vice-president of the American Statistical Association. He was one of the founders of the American Economic Association and a member of the National Academy of Science. He was an editor of the *Political Science Quarterly* from its establishment in 1886, and a frequent contributor to this and other scientific reviews. His principal published works are *Emigration and Immigration* (1890); *Statistics and Sociology* (1895); and *Statistics and Economics* (1899).

Meehan, Thomas, botanist and horticulturist, born in England, March 21, 1826; died in Philadelphia, Pa., Nov. 19, 1901. He was chiefly self-educated, and was at one time head gardener to Vernon Harcourt, at St. Clair, Isle of Wight. He removed to the United States in 1848, and at his death he was known as one of the fore-

most horticulturists and botanists in the country. He was the first to succeed in flowering the *Victoria regia* in America. He took an active interest in public affairs, serving continuously in the city council of Philadelphia after 1852, and as botanist of the Pennsylvania State Board of Agriculture from its formation till his death. For twenty-three years he was senior vice-president of the Philadelphia Academy of Natural Sciences. He was at one time a member of the Board of Visitors of Harvard University, and he had been elected a member of every important botanical and horticultural society of America and Europe. He contributed many articles to scientific periodicals on subjects of his life work. He was editor of the *Gardeners' Monthly Magazine* from 1859 to 1889, and established, with his sons, *Meehan's Monthly*. For sixteen years he was agricultural editor of *Forney's Weekly Press*. He published *The American Handbook of Ornamental Trees* (1853); *The Flowers and Ferns of the United States* (serial, *Meehan's Monthly*, 1878 to 1891); and many papers on original researches.

Michie, Peter Smith, soldier and educator, born in Brechin, Scotland, March 24, 1839; died in West Point, N. Y., Feb. 16, 1901. He was graduated at West Point in 1863, standing second in his class, was commissioned 1st lieutenant of engineers, June 11, and his first field service was in the operations against Charleston. He afterward distinguished himself in the battle of Olustee, and in May, 1864, he was transferred to the Army of the James, in Virginia, serving first as assistant and afterward as chief engineer up to the capitulation at Appomattox. He was commissioned captain, Nov. 23, 1865, and was brevetted captain and major, Oct. 28, 1864, for gallant and meritorious services in the campaign of 1864; lieutenant-colonel, April 9, 1865, for gallant and meritorious services in the campaign terminating at Appomattox; and brigadier-general of volunteers, Jan. 1, 1865. In 1867 his scientific acquirements led to his appointment as first assistant in the Department of Engineering and Chemistry at West Point, and later as Professor of Natural and Experimental Philosophy, where he served till the time of his death. He received the degree of Ph. D. from Princeton in 1871, of A. M. from Dartmouth in 1873, and of LL. D. from Union College in 1893. He was a member of the Board of Overseers of the Thayer School of Civil Engineering of Dartmouth College after 1871. In 1870 he was a member of the military commission that visited Europe to collect information for the Government. He was the author of *Elements of Wave Motion relating to Sound and Light*; *Life and Letters of Major-Gen. Emory Upton*; *Personnel of Sea-coast Defense*; *Elements of Analytical Mechanics*; *Elements of Hydro-mechanics*; *Practical Astronomy*; and *Life of Gen. McClellan*.

Michler, Francis, soldier, born in New York in 1849; died in Washington, D. C., May 29, 1901. He was graduated at West Point in 1870; commissioned 2d lieutenant, 5th Cavalry, June 15, 1870, and assigned to service in Arizona. He was commissioned 1st lieutenant, Nov. 12, 1876, and captain, May 23, 1888. He saw much hard fighting against the Indians; was present in the actions at Munchos Cañon, Sept. 25, 1872; Red Rock, Dec. 7, 1872; Clear Creek, Jan. 2, 1873; Tonto Creek, Jan. 22, 1873; and in the Mazatzel mountains, March 19, 1873. He was brevetted 1st lieutenant, Feb. 27, 1890, for gallant services in the Munchos Cañon and Tonto Creek engagements. He was made lieutenant-colonel of volunteers, May 9, 1898, and honorably discharged from the volunteer service, May 12, 1899. At his death

he was military secretary to Lieut.-Gen. Miles, with the rank of lieutenant-colonel.

Miller, Abram O., physician and soldier, born in Madison County, Ohio, Oct. 3, 1827; died in Lebanon, Ind., April 25, 1901. He was graduated in medicine at the State University of Kentucky in 1856. At the outbreak of the civil war he organized a company of three-months men for the 10th Indiana Infantry, and was its captain through its term of service. When the 10th Indiana was reorganized for the three years' service, Capt. Miller was made major, and he served in that capacity till Aug. 14, 1862, participating in the battles of Mill Spring and Shiloh and the siege of Corinth. He was then appointed colonel of the 72d Indiana Infantry. When Gen. Wilder was compelled to retire on account of ill health after the battle of Chickamauga he left Col. Miller in command of the famous Wilder brigade, which he commanded from that time till the close of the war, during some of its most arduous campaigns and in some of its severest battles. He was severely wounded while leading the charge on the works at Selma, Ala., and was several months in the hospital in Montgomery. He was brevetted brigadier-general. After the war he returned to the practise of medicine in Lebanon, Ind. For four years after 1868 he was clerk of the circuit court, elected on the Republican ticket. As candidate for State Auditor he was defeated in 1878.

Miller, Adam, Methodist clergyman, born in Maryland in 1810; died in Chicago, Ill., July 29, 1901. He was often called the father of the German Methodist Church in the United States. He was of Pennsylvania German parentage, and was taken in infancy to Ohio. In 1830 he went with the Rev. Joseph McDowell to Knox County, Ohio, and in the autumn of that year he was licensed to preach by the Ohio Conference and assigned to the Nicholas Circuit, Virginia, in the Kanawha district, where he preached for four years. Previous to 1834 he had preached in English, but in that year he began preaching in German, and after that time interested himself almost entirely among the great numbers of Germans that emigrated into that region. In 1835 he was appointed to the Greenville, Ohio, circuit, and in 1837 to the Milford circuit. He was stationed in Cincinnati in 1841-'42, and while there collected the funds for and built the first German Methodist church in that city. In 1843 he was sent to Baltimore to take charge of the German mission work. Soon afterward he left the ministry on account of a throat trouble, and took up the practise of medicine. When nineteen years old he published *Footprints through Nature to the Supernatural*; in 1843, *Origin and Progress of the German Missions in the Methodist Episcopal Church*; and in 1859, *Experience of German Methodist Preachers*.

Miner, James Griffiths, inventor, born in Albany, N. Y., March 27, 1816; died in Milford, Ohio, May 28, 1901. His father was a wealthy iron manufacturer, and the son studied at Edinburgh University. As a young man he went by sea to Texas, where he became a friend of Gen. Sam Houston. He fought under him, and later under Gen. Taylor through the Mexican War. He made a fortune in ranching in Texas and gold-mining in Colorado, and invested it in the iron industry. He built the Cambria Iron-Works, in Johnstown, Pa., in 1855, and is said to have manufactured there the first steel rails produced in the United States. In 1856 he was president of the Harvey Iron and Steel Company, in Mott Haven, N. Y., and later bought a controlling in-

terest in the Tredegar Works, in Richmond, Va. At the beginning of the civil war Miner was placed in charge of the Confederate ordnance department, when the works were appropriated by the Confederate Government as an arsenal, and for a time he served as assistant secretary of the Confederate navy. Later he was in charge of the railroads for the Confederate Government. So great was his confidence in the outcome of the war that he invested his entire fortune in Confederate securities, and after its close found himself penniless. He invented a high-pressure engine, but could not bring it to success. He also had discovered a process for making pulp into boards, and another for converting iron into steel, for which he had received several liberal offers, and with which secret he refused to part. For many years he had lived in abject poverty. A few weeks before his death he was taken to the home of Mrs. L. M. Spencer, and there cared for till his death.

Mitkiewicz, Eugene Stanislaus Kostka de, "Count," adventurer, born in Warsaw, Poland, about 1844; died in Asbury Park, N. J., May 13, 1901. He appeared in New York in the autumn of 1863, where he registered as Count Mitkiewicz, of St. Petersburg. He dressed in the height of fashion, apparently had plenty of money, and represented that his father had sent him out to see the world as a part of his education before he came into the great estates in Russia that would be his inheritance. He made love to many women, and it was not till he had robbed them of their jewels that they discovered his true character. One of these prosecuted him, and he was convicted of grand larceny. Many efforts were made to have him released from the Tombs, but he remained there several weeks, finally getting out on bail on condition that he would join the National army. His military career was very brief. In July, 1864, he disappeared from Washington, where he was stationed, after robbing the wife of the colonel of a New Jersey regiment of a gold watch and the costly jewels that she had worn to a *fête* given in her honor. In 1874 he became acquainted on a steamship with the daughter of a banker of Rochester, N. Y., and after a year, in which her parents endeavored in every way to show her his real character and to persuade her from such an act, married her against their will. They had been married but a short time when the "Count" got possession of her fortune and spent every cent of it. The three children that were born were taken possession of by the grandparents after the mother had died of nervous prostration. In 1879 he induced a wealthy merchant of Baltimore, named Cooke, to join with him in the coal business. This was a failure, and in the end Mitkiewicz was arrested for attempting to defraud his partners by having a judgment entered against himself and in favor of another man. He escaped conviction on a technicality, and soon afterward attempted to defraud William C. Turnbull, inventor of the long-distance telephone, of his patents. Mitkiewicz was beaten in the courts, but he always claimed the ownership of the telephone. In 1887 he induced Wharton Barker, of Philadelphia, who was interested in introducing the telephone into China, to advance a large sum of money, representing that he, Mitkiewicz, had great influence with the Chinese Government, and that the Chinese Government was about to grant important concessions to him. He secured a letter from the Chinese minister in Washington, and in July, 1887, he arrived in China. He secured the telephone concession, and was about to secure a

large banking concession, when the newspapers were let into the scheme through the ingenuousness of the United States consul in Shanghai, and, Mitkiewicz's record being shown, the concessions were withdrawn. On his return he represented to Barker that the concessions had been granted, and that \$25,000,000 were to be put into the scheme, but then Barker would have nothing to do with him. Mitkiewicz sued Barker for breach of contract, and though he lost in the courts he succeeded in dragging in several high officials of the Chinese and United States governments. He later, in Washington, lived in luxury with "Shoe-box" Miller, an ex-convict, whom he introduced to Miss Mosby. Miller was about to marry Miss Mosby when the plot was discovered, and in his attempt to find Miller, her brother came upon Mitkiewicz and fired at him, but missed his mark. The "Count" afterward eloped with a Baltimore woman, lived for a time in New York, and in 1894 married the twenty-two-year-old daughter of a wealthy farmer.

Monroe, Halsey H., agriculturist, born in Thomaston, Me., Nov. 13, 1827; died there, Jan. 17, 1901. He was educated in the public schools in Thomaston and at Auburn Academy. After several years in Scotland he engaged in the lime business in Rockland, Me. In 1867 he was elected to the Maine Legislature. In 1868 he was returned and served on the Committee on Elections. In 1879 he was a member of Gov. Garcelon's council, and was chairman of the Committee on County Officers. At the time of the famous "State count-out," when the Governor's term expired in the midst of the trouble, Mr. Monroe, as senior member of the council, occupied the Governor's chair two weeks. In 1890 he was again sent to the Legislature. He owned one of the best farms in Maine, and was the inventor of the rotary harrow now in almost universal use. He owned large tracts of timber land in Arkansas and Virginia.

Moore, John, Roman Catholic bishop, born in Castletown, Delvin, County Westmeath, Ireland, June 27, 1835; died in St. Augustine, Fla., July 30, 1901. He removed in 1848 to Charleston, S. C., and one year later entered the Collegiate Institute in that city. After some years of preparation there he went abroad and studied philosophy and the classics in France and theology in Rome. He was ordained priest, April 9, 1860, and before leaving Rome he received the cap of Doctor of Theology. Returning to Charleston in October, 1860, he was made first assistant, and later pastor of the cathedral in that city. During the civil war he gave much time to the sick and wounded of both armies. In 1865 he became pastor of St. Patrick's Church in Charleston, and in 1872 vicar-general of the diocese of Charleston. On May 13, 1877, he was consecrated Bishop of St. Augustine, Fla. Under his administration the Church in Florida made rapid and substantial advancement. Bishop Moore took great interest in the negro race, and established several associations for its benefit.

Moore, William Philip, actor, born in Norfolk County, Ontario, Canada, May 13, 1858; died in Baltimore, Md., Sept. 28, 1901. He first appeared on the stage with James H. Reilly, in 1877, in *The Broom-maker*, and later with John F. Leonard in *Hogan's Alley*. From 1878 to 1881 he was engaged by Henry Jarrett to play with George Topack in *Fun on the Bristol*. In 1882 he married Belle Vivian, and as Moore and Vivian they entered upon vaudeville. In 1884 they were in Robert Gratan's company in *Wanted*, a *Partner*; from 1885 to 1891, with their own com-

pany, they played *Jonathan*, or *The Law of the Land*. In 1891 Mr. Moore originated the part of Joshua Spruceby. In 1893 he played with J. J. Sullivan in *The Black Show*. Mr. Moore then tried repertoire, playing *Yankee Pluck*, *Solon Shingle*, *Joshua Night Mare*, and *Our Jonathan*. In 1894 Moore and Vivian went back into vaudeville and played at the Auditorium in Baltimore several weeks. In 1898 Mr. Moore opened a theatrical agency.

Moran, Edward, artist, born in Bolton, England, Aug. 19, 1829; died in New York city, June 9, 1901. He was the eldest son in a large family, two others of whom, Thomas and Peter, also attained eminence as artists. His parents were hand-loom weavers, and as a boy Edward worked at this trade. In 1841 the family removed to the United States, and settled first in Maryland and later in Philadelphia. Moran continued to work at the loom until he was twenty-two, when letters of introduction to Paul Webber and James Hamilton were obtained for him. He set up a studio in Philadelphia, and made rapid progress. His paintings were soon admitted to important exhibitions. In 1862 he studied in the Royal Academy, London, for a few months. In 1869 he removed to New York city. He painted many landscapes and pictures of animals, but was best known as a marine painter. His most important work consists of 13 paintings representing epochs in the marine history of the United States. The first of this series—*The Ocean, the Highway of all Nations*—a large canvas representing a single wave with two or three sea-gulls in the foreground, is said by critics to be his masterpiece. Other well-known pictures are *The Statue of Liberty on the Day of the Unveiling*, *New York Harbor*, *The White Cliffs of Albion*, *The Launching of the Life-boat*, and *Return of the Fishers*.

Morant, Fanny, actress, born in Hampshire County, England, in 1821; died in Brighton, England, Nov. 1, 1901. She was educated in a convent in Paris. At the age of sixteen she was thrown upon her own resources by the death of her father, and after serving as a governess for a short time made her first appearance on the stage as walking lady, and as understudy for the leading women of the Drury Lane stock company. In 1856 she was brought to the United States for an eight months' tour, and at its conclusion decided not to return to England. In the season of 1857-'58 she made a starring tour, and on her return to New York she was engaged as leading woman at the old Broadway Theater, and made her first appearance there, Oct. 18, 1858. The following summer she played five months in San Francisco. Jan. 28, 1860, she married Charles Smith, a wealthy manufacturer, of Warren, R. I., and in the same year was engaged by James Wallack to play the governess in *The Romance of a Poor Young Man*. She remained with the Wallack company till the spring of 1869, and in August of that year appeared as the nurse in *Romeo and Juliet* at Booth's Theater. She subsequently played *Gretchen* to Joseph Jefferson's *Rip Van Winkle*, and made notable successes as the *Queen in Hamlet* and as *Lady Macbeth* with Edwin Booth. In June, 1870, she became a member of Augustin Daly's company at the Fifth Avenue Theater, appearing first as Countess Clothilde in *Sardou's Fernande*; in the spring of 1871, with Charles Mathews, in *Not such a Fool as he Looks*; and later as Olivia Alston in *Saratoga*. She remained at the old and new Fifth Avenue Theaters till 1874. She then became a member of the Union Square Theater stock company, and appeared

there, Aug. 19, 1874, as Mrs. Reid in *Jane Eyre*; in November, 1875, as Countess de Vernay in *Rose Michel*; and a month later as Countess de Linieres in *The Two Orphans*. She last appeared in 1879 as the Countess in *The Danicheffs*. After her retirement from the stage she lived in Providence, R. I.

Morse, James C., lawyer, born in Natchitoches, La., in 1849; died in New Orleans, La., Feb. 11, 1901. At the outbreak of the civil war he entered the Confederate army in the engineers' department, and he served throughout the struggle. In 1880 he was appointed assistant adjutant-general of Louisiana, and in 1884 assistant attorney-general. In the antislavery campaign of 1892 he was one of the committee of seven appointed to manage the election, which resulted in a split of the Democratic party. In recognition of his services he was appointed judge of the Criminal District Court of New Orleans. His term expired in 1900, and he was reelected.

Mosby, Tom, negro philanthropist, probably more than a hundred years old; died in New Decatur, Ala., July 16, 1901. Before the civil war he was a slave on the Mosby plantation. After the war, by hard work he and his wife soon accumulated \$500, with which they bought and improved 40 acres in Moulton Heights, now a suburb of New Decatur. In the boom of 1886 they sold half their land at a good price, bought land farther out, and put a snug sum in the bank. During the years after the war "Uncle Tom" and his wife, in times of need, befriended and cared for many of the old ex-slaves of the plantation on which they had toiled in former days, as well as many others of their race. They had no children, but their home was converted into a sort of orphanage, and many well-to-do negroes owe their condition to the start they received within its walls. Uncle Tom left a considerable fortune, to be used in charitable work among the negroes.

Mott, George Scudder, clergyman and author, born in New York city, Nov. 25, 1829; died in Orange, N. J., Oct. 12, 1901. He was graduated at New York University in 1850, and at Princeton Theological Seminary in 1853. He received the degrees of A.M. and D.D. from Princeton in 1874. In October, 1853, he became pastor of the Second Presbyterian Church, of Rahway. He resigned in 1858, and after a year's rest accepted a call to the Presbyterian Church in Newton, N. J., and worked there ten years. During that period the civil war occurred, and Dr. Mott took strong ground as a Union man. In 1869 he was called to the Presbyterian church at Flemington, N.J., and he remained there as pastor twenty-six years. He was elected a director of Lincoln University, Oxford, Pa., in 1872, and served in that capacity many years. He was particularly interested in the cause of Sabbath observance, and was ten years president of the New Jersey Sabbath Union, and he was one of the founders of the American Sabbath Union, its vice-president till the death of Elliott F. Shepard, and succeeded him as its president. He contributed extensively to the religious press, and his three books—*The Prodigal Son*, *The Resurrection of the Dead*, and *The Perfect Law*—published between 1866 and 1872, had a large sale and were translated into several languages. A tract, *Holding on to Christ*, published by the American Tract Society, reached 250,000 copies.

Mount, James Atwell, ex-Governor of Indiana, born in Montgomery County, Indiana, March 23, 1843; died in Indianapolis, Ind., Jan. 16, 1901. He was a farmer's son, and up to the beginning

of the civil war had received only such education as could be obtained from country schools. He enlisted in 1862 as a sergeant in the 72d Indiana Infantry, and served till the end of the war in Wilder's brigade. He afterward attended for one year the Presbyterian Academy, in Lebanon, Ind. He owned a farm of 500 acres in Montgomery County. In 1888 he was elected to the State Senate, and in 1890 he was nominated for Congress, but was defeated. He was elected Governor of Indiana on the Republican ticket in 1896, his term of office expiring Jan. 1, 1901. Gov. Mount's success as a farmer and his ability as a public speaker brought him often as a lecturer before agricultural colleges and farmers' institutes, and this in his campaign for Governor brought him the hearty support of the farmer vote. He created much comment in April, 1900, by refusing to extradite Gov. Taylor, of Kentucky, who was wanted in his own State in connection with the Goebel assassination.

Mrak, Ignatius, Roman Catholic bishop, born in Hotoula, parish of Poljane, Carniola, Austria, Oct. 10, 1810; died in Marquette, Mich., Jan. 2, 1901. He was ordained Aug. 13, 1837, and served as parish priest in Carniola till 1845, when he was called to the United States for mission work among the Indians of northern Michigan. He and Bishop Baraga established many missions. He served as vicar-general of Sault Ste. Marie from 1860 to 1869, and as Bishop of Marquette and Sault Ste. Marie from 1869 till 1878, when he resigned that office because of increasing infirmities. After 1881 he was designated Titular Bishop of Antioch.

Muhlenberg, Frederick Augustus, educator, born in Lancaster, Pa., Aug. 25, 1818; died in Reading, Pa., March 21, 1901. He was graduated at Princeton in 1836, and was a professor in Franklin College, Lancaster, until 1850. In the same year he became Professor of Ancient Languages in Pennsylvania College, Gettysburg, which chair he held until 1867. In that year Muhlenberg College was established, and he was elected its first president. In 1876 he resigned the presidency and accepted the professorship of Greek in the University of Pennsylvania. Here he could again devote himself to those scholarly pursuits which were in harmony with his natural inclinations. In 1888 he resigned his chair in order to rest. In 1891 he accepted temporarily the presidency of Thiel College, Greenville, Pa., at a critical period of its history, and his presence was immediately followed by the strengthening of confidence in the college and by a new spirit of interest on the part of the students. In 1893 he resigned and removed to Reading. Dr. Muhlenberg was ordained to the office of the ministry in the Lutheran Church in 1854. He contributed many articles on historical and educational subjects to the periodicals of the Church.

Murphy, Thomas, politician, born in Limerick, Ireland, July 20, 1821; died in New York city, Aug. 17, 1901. He removed to the United States and engaged in the fur business in New York city. He entered politics as a Whig, and on the organization of the Republican party allied his fortunes with it and became an active worker. In 1866 he was elected to the State Senate. He was a personal friend of President Grant, and in 1870 was appointed collector of the port of New York. He resigned in November, 1871, on account of political attacks by the Greeley faction. Later he was an unsuccessful candidate for Congress. His time in later years was devoted to the breeding of fine horses on his farms at Deal, N. J.

Murray, Randolph, actor, born in England about 1840; died in New York city, Aug. 23, 1901. He was brought to the United States by his parents, and when twenty years of age went upon the stage. He acted chiefly in melodrama, appearing in later years as Charles Creston in *The Sleeping City*, George Marston in *The Derby Mascot*, and Uncle Cesaire in *Sapho*. He served as a gunner in the United States navy in the civil war, and during the Spanish-American War he was an officer in the Rough Riders, and was severely wounded in the Santiago campaign.

Musick, John Roy, author, born in St. Louis County, Missouri, Feb. 28, 1849; died in Omaha, Neb., April 14, 1901. He was graduated at the Northern Missouri State Normal School in 1874, was admitted to the bar in 1877, and practised law, chiefly in Kirksville, Mo., till 1882, when he devoted his time to journalism and authorship. His first story was *Justice Courts*, printed in *Potter's American Monthly* in 1878. He was the author of *The Banker of Bedford*; *History Series of Missouri*; *Calamity Row*; *Brother against Brother*; *The Mysterious Mr. Howard*; *Hawaii: Our New Possessions*; *The War with Spain*; *Lights and Shadows of the War with Spain*; *His Brother's Crime*; *Cuba Libre*; and the *Columbian novels* (*Columbia*, *Estevan*, *St. Augustine*, *Pocahontas*, *The Pilgrims*, *A Century too Soon*; *A Story of Bacon's Rebellion*, *The Witch of Salem*, *Braddock*, *Independence*, *Sustained Honor*, *Humbled Pride*, *Union*), a series of 12 novels in which he attempted to cover the history of the United States. These were written in about twenty-four months, in 1891 to 1893, in order to complete the series before the closing of the *Columbian Exposition* in Chicago. The newspapers gave Mr. Musick considerable notoriety through the publication of supposed plagiarisms of Dickens and *St. Pierre* that they said were to be found in these novels.

Negley, James Scott, soldier, born in East Liberty (now East End, Pittsburg), Pa., Dec. 22, 1826; died in Plainfield, N. J., Aug. 7, 1901. He was educated in the public schools and at the Western University of Pennsylvania. He served with the 1st Pennsylvania Regiment through the Mexican War. He then engaged in manufacturing and railroad building. At the outbreak of the civil war he was brigadier-general of the 18th Division of Pennsylvania militia. In ten days, in April, 1861, he organized, clothed, and equipped a brigade for three months' service. He was commissioned brigadier-general of volunteers in April, 1861, and served with distinction until mustered out, Jan. 19, 1865. At Laverne, Oct. 7, 1862, he defeated the Confederates under Anderson and Forrest. For gallantry in action at the battle of Stone River he was made major-general and placed in command of the 18th Division, 14th Army Corps. He led the forward movement upon Tullahoma, and in the battle of Chickamauga he held Owen's Gap. After the war he engaged in business in Pittsburg, was president and vice-president of several railroads, and was connected with many large enterprises. He was a member of Congress (elected as a Republican) from 1869 to 1873, from 1875 to 1877, and from 1885 to 1887. He was for fifteen years a member of the Board of Managers of the National Home for Volunteers; and was president of the National Union League of America.

Nevin, Ethelbert, composer, born in Edgeworth, Pa., Nov. 25, 1862; died in New Haven, Conn., Feb. 17, 1901. He was a son of Robert P. Nevin, the author, who early recognized his son's artistic taste and permitted him to devote his life

to music. He studied first in Pittsburg, and in 1884 went to Berlin to study under Karl Klindworth. He also studied under Hans von Bülow, and in 1887 he returned to the United States. He had his studio in Boston, and from time to time appeared in public, though he was best known through the popularity of his songs. In 1892 he spent a year in Paris coaching opera-singers. The following year he traveled in Algiers and Italy, and for some time afterward he resided in Florence and Venice. His last appearance in New York was in 1897, when, with Mrs. Julie Wyman, he gave a recital of his songs at the Carnegie Lyceum. In 1900 he removed to New Haven, Conn. When eleven years old Mr. Nevin composed a polka; *The Rosary*, and his serenade, *Good-night, Good-night, Beloved*, were written when he was thirteen; and two of his best-known pieces, *Narcissus*, and *Oh, that we Two were Maying*, when he was but fifteen. *May in Tuscany* and *A Day in Venice* were composed in Italy. Among his many popular songs are: *Bedtime Song*; *Cradle Song*; *I once had a Sweet Little Doll*; and *Milkmaid's Song*. His songs are more popular than those written by any other American composer. *Narcissus*, one of a series of water sketches, always regarded by Mr. Nevin as one of his most trivial compositions, is played in almost every country of the world, and has sold more than 125,000 copies.

Newell, Robert Henry (Orpheus C. Kerr), author and humorist, born in New York city, Dec. 13, 1836; died in Brooklyn, N. Y., about July 1, 1901. After receiving an academic education he engaged in newspaper work. He was literary editor of the *New York Mercury* from 1858 to 1862; was on the staff of the *New York World* from 1869 to 1874, in which he edited a column of social studies; and was editor of a weekly paper, *Hearth and Home*, from 1874 to 1876. He wrote the *Orpheus C. Kerr letters* on the civil war, which were published in 4 volumes (1862-'68), and were a great success. He was also for a time war correspondent of the *New York Herald*. In recent years he had lived quietly in New York city, where he took an active interest in the Society for the Prevention of Cruelty to Animals. He attracted considerable unpleasant public attention by his marriage in July, 1863, to Adah Isaacs Mencken (*Dolores Adios Fuertes*), the author of *Indigine* and *Infelicia*, who had been divorced from her second husband, John C. Heenan, the prize-fighter, the year before, and from whom Mr. Newell was divorced in 1865. Mr. Newell was the author of *The Palace Beautiful* and *Other Poems* (1865); *Avery Glibun*, or *Between Two Fires*, an American romance (1867); *The Cloven Foot*, an adaptation of Edwin Drood to American scenes and American readers (1870); *Versatilities*, poems (1871); *The Walking Doll*, a novel of New York life (1872); *Studies in Stanzas* (1882); *There was once a Man* (1884); *Smoked Glass*; and another volume of poems.

Newell, William Augustus, ex-Governor of New Jersey, born in Franklin, Ohio, Sept. 5, 1817; died in Allentown, N. J., Aug. 8, 1901. He was graduated at Rutgers College in 1836, and in medicine at the University of Pennsylvania in 1839. He received the degree of LL.D. from Rutgers in 1871. He was elected as a Whig to Congress in 1846, and was reelected in 1848, and served a third time from 1865 to 1867. While in Congress he formed a friendship with Abraham Lincoln, and was family physician to the President during his occupancy of the White House. Dr. Newell was the founder of the Government

life-saving service, planning the system and introducing the bill that resulted in its establishment in 1848. The first test was on the New Jersey coast, between Sandy Hook and Toms River. He also invented the system of securing connection with a wrecked vessel by means of a shot attached to a line and fired from a mortar. Other important public works that were due to his labors or his suggestion were the building of the Delaware breakwater; the establishment of the United States Agricultural Bureau (later made the Department of Agriculture); and the purchase of the Mount Vernon estate for agricultural purposes. He was Governor of New Jersey from 1857 to 1859. He was inaugurated in the midst of a heavy snowstorm that obstructed the roads, but, accompanied by a colored servant, he walked from Allentown to Trenton, 18 miles, in order not to postpone the ceremony. In his term the Democratic Senate refused to confirm his appointment of Henry W. Green as Chancellor, and for a year the State was without a Chancellor. He was superintendent of the life-saving service in New Jersey from 1860 to 1864. He was again a candidate for Governor in 1876, but was defeated by Gen. George B. McClellan. He was Governor of Washington Territory from 1880 to 1884, and in the latter year was made Indian inspector. He served as resident surgeon of the Soldiers' and Sailors' Home, State of Washington, from 1894 to 1898.

Nicolay, John George, author, born in Essingen, Bavaria, Feb. 26, 1832; died in Washington, D. C., Sept. 26, 1901. The family emigrated to the United States in 1838, going first to Cincinnati

by way of New Orleans and the Mississippi river, and afterward successively to Indiana, Missouri, and Pike County, Illinois, where the father rented and repaired an old grist-mill, and went into business with his sons. In these wanderings young Nicolay spent about two months in the public schools of Cincinnati and St. Louis. Thrown on his own resources at the age

of fourteen, he lived for a while with an older brother and clerked in a store in Whitehall, Ill., and when about sixteen he secured a place in the office of the Pike County Free Press, in Pittsfield, Ill. He remained with this paper till 1856, and was successively journeyman, partner, publisher, editor, and proprietor. As an editor he soon became a political power in the State. He refused flattering offers from the newspapers of Chicago and St. Louis, and took an active part in the formation of the Anti-Nebraska and Republican parties. At the close of the Fremont campaign in 1856 Mr. Nicolay sold his paper and became a clerk in the office of the Secretary of State at Springfield, Ill. When Lincoln was nominated for the presidency he appointed Nicolay his private secretary. After the election the correspondence of Mr. Lincoln increased so much that it was necessary to appoint an assistant, and Mr. Nicolay chose for this place John Hay, the present Secretary of State, who was then a young law student in Springfield. During the first presidential term Nicolay and Hay occupied the same room at the White House together,

performing the laborious and often delicate duties that fell to them, and enjoying the closest confidence of President Lincoln. During this time they formed the plan, with the approval of Mr. Lincoln, of writing his biography, which design they carried out later in collaboration. Shortly before his assassination, the President appointed Mr. Nicolay United States consul at Paris, and appointed Mr. Hay secretary of the American legation there. Mr. Nicolay held that office until the spring of 1869. Upon his return to Washington he lived in retirement until 1872, when he was appointed marshal of the Supreme Court of the United States, and he held that office fifteen years. Mr. Nicolay and Mr. Hay began the active work of writing their biography of Lincoln in 1874; they had spent six years in gathering and arranging their material. Its serial publication was begun in the Century Magazine in November, 1886, and continued until February, 1890. In the latter year the complete work, with many important chapters not included in the serial publication, was issued in ten volumes. Messrs. Nicolay and Hay also collected, catalogued, and edited Abraham Lincoln's Complete Works (1894). In addition, Mr. Nicolay wrote in 1881 *The Outbreak of the Rebellion*, the first volume of a series entitled *Campaigns of the Civil War*. Mr. Nicolay also wrote the article on President Lincoln in the *Encyclopædia Britannica*, and contributed numerous articles to American magazines. He was a lover of art and music, and a poet of unusual merit, and received many patents.

Ninde, William Xavier, Methodist Episcopal bishop, born in Cortland, N. Y., June 21, 1832; died in Detroit, Mich., Jan. 3, 1901. He was graduated at Wesleyan University, Middletown, Conn., in 1855, and from that institution received the degree of D. D. in 1874, and from Northwestern University the degree of LL. D. in 1892. He taught in Rome Academy during the year after his graduation, and was then ordained to the Methodist ministry. He joined the Rock River Conference, and in 1861 was transferred to the Cincinnati Conference. In 1870 he was transferred to the Detroit Conference and stationed at the Central Methodist Episcopal Church, in Detroit, where he served till 1873. In the latter year he was elected to the chair of Practical Theology in Garrett Biblical Institute, in Evanston, Ill., and in 1879 he became president of that institution. In May, 1884, he was elected to the Board of Bishops of the Methodist Episcopal Church by the General Conference.

Nordhoff, Charles, author, born in Erwitte, Westphalia, Prussia, Aug. 31, 1830; died in San Francisco, Cal., July 15, 1901. He came with his parents to America in 1835, and attended school in Cincinnati, where he was apprenticed to a printer in 1843. In 1844 he went to Philadelphia to work in a newspaper office, but soon shipped in the United States navy and served three years, making a voyage round the world. He remained at sea in the merchant, whaling, and mackerel fishery service till 1853, and was afterward employed in newspaper offices in Philadelphia and Indianapolis. From 1857 till 1861 he was an editor in a publishing house in New York. From 1861 till 1871 he was on the staff of the New York Evening Post, and subsequently he contributed to the New York Tribune. He traveled in California and Hawaii in 1871-73, and after 1874 was a special correspondent of the New York Herald. He edited an American edition of Kern's *Practical Landscape Gardening* (1855), and was the author of the following books: *Man-of-War Life* (1855); *The Merchant Vessel* (1855); *Whal-*

ing and Fishing (1856); Nine Years a Sailor (1857); Stories from the Island World (1857); Secession is Rebellion (1860); The Freedmen of the South Carolina Sea Islands (1863); America for Free Working Men (1865); Cape Cod and All Along Shore (1868); California for Health, Pleasure, and Residence (1872); Northern California, Oregon, and the Sandwich Islands (1874); Politics for Young Americans (1875); The Communitistic Societies of the United States (1875); The Cotton States in the Spring and Summer of 1875 (1876); God and the Future Life (1881); and Peninsular California (1888).

Nugent, Robert, soldier, born in Kilkeel, County Down, Ireland, in 1824; died in Brooklyn, N. Y., June 20, 1901. He emigrated to the United States when a boy, and in 1853 became a member of the 69th New York Regiment, and at the time of the outbreak of the civil war was its lieutenant-colonel. The regiment was one of the first to respond to President Lincoln's call for troops. It went to the front in April, 1861; fought in the first battle of Bull Run; returned to New York, and was mustered out Aug. 3. Nugent was commissioned captain in the regular army Aug. 5, and was assigned to the 13th Infantry. In October Capt. Nugent obtained a leave of absence, and returning to New York, organized the 69th New York Volunteers and became its colonel. In command of this regiment Col. Nugent served in the battles on the Peninsula and at Antietam and Fredericksburg. At Fredericksburg he received the wound that finally caused his death. A short time after this battle he was sent home to recuperate. He set out to rejoin his regiment, but was informed that he had been appointed provost marshal for the Southern District of New York. He had charge of this district during the draft riots, and took command of the troops. The wrath of the mob turned against him, and his home was burned to the ground. He was brevetted major, June 27, 1862, for gallant and meritorious services in the battle of Gaines Mill; lieutenant-colonel, Dec. 13, 1862, and colonel, April 2, 1865, for similar services at Fredericksburg; and brigadier-general of volunteers, March 13, 1865, for faithful and meritorious services during the war. In 1865, after the 69th had been mustered out, Gen. Nugent rejoined his regiment, the 13th Infantry. He served with this regiment until June 10, 1876, when he was made a major, and transferred to the 24th Regiment. In these two regiments he gained a reputation as an Indian fighter. He was retired March 20, 1879, and afterward resided in New York.

Osborn, Luther Washington, consul, born in Ithaca, N. Y., in November, 1843; died in Apia, Samoan Islands, Oct. 27, 1901. He served with the 142d New York Volunteers in the civil war, and was commissioned 1st lieutenant for meritorious services. He studied law and was admitted to the bar in Rochester, N. Y., in 1868, and in 1869 he located in Nebraska, where he practised for twenty-eight years. He was a delegate to the Republican National Convention in 1876, and a member of the Republican National Committee from 1876 to 1880, and was a member of the State Senate from 1873 to 1875. He was appointed consul-general in Samoa, July 26, 1897, with the additional duties of consul-general for Nukualofa, capital of the Tonga group of islands. In Samoa, in the troublesome times preceding the partition, he obtained the confidence of the natives and of the representatives of the foreign powers, and alone of all seemed to arouse no opposition. He was dean of all the consular or diplomatic boards in 1899, and till March 1,

1900; dean of representatives acting as and for king and council, May, 1899, to March 1, 1900; and chief justice of Samoa, May, 1899, to March 1, 1900.

Palmer, Hugh Poulson Frazer, war correspondent, born in London, England, March 1, 1844; died in Boston, Mass., Jan. 20, 1901. At the age of eighteen he entered the employ of the Lloyds, and for twelve years continued in its service. He raised 17 wrecks before he was nineteen years old. He was a secret-service agent in the employ of the Spanish Government during the Carlist uprising, and through his efforts the plotters, with their arms, were surrendered. For this and other services he was rewarded by the Queen of Spain, and he also received official recognition from his own Government. He removed to the United States in 1882. During the Turkish War he was special correspondent to the London Times, writing under the pseudonym of Warhawk. Capt. Palmer spoke fluently 8 languages.

Parent, Marie (Mary Ann McCoskey), educator, born in Liverpool, England, in 1817; died in New Orleans, La., in 1901. She early removed to New Orleans, where she married a creole, Francis Parent. She was principal of the first girls' public schools in the city, and resigned to establish Parent's Academy, which at the breaking out of the civil war was one of the largest and best-known secondary schools in the South. After the occupation of New Orleans by the National forces Mme. Parent went to Cuba, and in Havana established the College de Maria for girls, which she conducted for twenty-five years, afterward returning to New Orleans.

Parker, Edwin W., Methodist Episcopal bishop, born in St. Johnsbury, Vt., Jan. 21, 1833; died in Naini Tal, India, June 4, 1901. He was graduated at the Concord, N. H., Biblical Institute in 1857, and for two years was a pastor in the Vermont Conference. He was ordained deacon and elder under the missionary rule at the New England Conference in 1859, and sailed for India. He was first assigned to the district of Bijnor, and later to Moradabad. When the India Conference was organized in 1864 he was appointed presiding elder, and he filled this place, with the exception of three years, until he was elected bishop by the General Conference of 1900.

Parker, Laura Wolcott (Jackson), army nurse, born in Newark, N. J., May 5, 1829; died in Boston, Mass., Jan. 9, 1901. In 1861 she went South as a nurse on the hospital steamer Daniel Webster, under the direction of the Sanitary Commission, together with Miss Abbie and Miss Georgie Woolsey. She married Charles H. Parker, of Boston, in 1864, and afterward resided in that city, where she was interested in philanthropic work. For seven years she was president of the Massachusetts Indian Association.

Parsell, Henry Van Arsdale, philanthropist, born in New Brunswick, N. J., Sept. 3, 1833; died in New York city, May 29, 1901. When a young man he was employed in the jewelry house of Fellows, Van Arsdale & Cooper, and later, as a member of the firm of Ball, Barnard & Parsell, engaged in the same business. As the greater number of the firm's customers were in the South, it was forced to discontinue business when the civil war broke out. Mr. Parsell then became assistant secretary of the Young Men's Christian Association, and about the same time was made paying-teller of the North River Savings-Bank. He was afterward secretary of the bank, serving till 1889, when he resigned to administer the large estate and conduct the business of his brother-in-law, F. Norris Peters. After 1895 he served as

a director of the Society for the Prevention of Crime. He was treasurer of the New Amsterdam Eye-and-Ear Hospital, a director of the North River Savings-Bank, a member of many clubs, and was actively connected with the American Museum of Natural History, the Metropolitan Museum of Art, the New York Botanical Gardens, and the Society for the Prevention of Cruelty to Animals. During his later years almost his entire income was devoted to charitable work. His favorite method was to open an account for a young man in the North River Savings-Bank, admonishing him to deposit something every week or every month. If this was done, Mr. Parsell would from time to time send for the bank-book and add to the amount.

Parsons, Cornelius Rice, legislator, born in York, N. Y., May 22, 1842; died in Rochester, N. Y., Jan. 30, 1901. His father, Thomas Parsons, who afterward became well known in the politics of the State and was a member of the

Senate at Albany, removed to Rochester in 1845. He had a large lumber business. The son received the best education that the schools of Rochester could give him, and then took part in his father's business. He was elected a member of the common council in 1867, 1868, 1870, and 1874, and in this service acquired a popularity that led to his candi-

dacy for the mayoralty in 1876. He was elected, and he retained the office, by successive elections, fourteen years, being perhaps the most popular mayor that the city ever had. In 1891 he was elected to the Assembly, and a year later to the State Senate, where he held his seat by successive elections to the end of his life. He served on many important committees, doing a great deal of hard work in the Legislature, but did not often speak there, though he could make a good speech on occasions. His popularity was largely due to his genial nature and his approachableness. As mayor he was unfailing in consideration for the poor and ignorant, not simply those who needed help from the city, but those who needed advice and guidance. It is said that all old working men or women who were troubled over water rates, or assessments, or proposed improvements, and called at the mayor's office to ask for information—and many of them had a wise impulse to go there—were sure of a welcome. Their grievances were heard with patience, and Mr. Parsons, not content with advising them what to do, or where to go, would step out with them to the office in the city hall, where they should lodge their complaint, and recommend instant attention. A Rochester journal opposed to Mr. Parsons in politics, said of him: "The secret of his great popularity was to be found, not in one but in several admirable characteristics—in his unfailing amiability, in his untiring efforts to oblige his political friends, and in his stanch support of the interests which he was chosen to represent. In the mayoralty he demonstrated to the satis-

faction of the people that he had the city's interests at heart and could do most effective work in furthering those interests. Therefore he was chosen seven times as the city's chief executive."

Passavant, William Alfred, philanthropist, born in Pittsburg, Pa., Jan. 23, 1857; died near that city, July 1, 1901. He was graduated at Muhlenberg College in 1875, and in 1879 at the Philadelphia Theological Seminary, and was ordained to the ministry of the Lutheran Church. He was pastor six years of congregations near Pittsburg, and one year of Christ Church, in that city. With his father he established in 1881 a biweekly church paper, *The Workman*, of which he was manager and associate editor six years, and later owner and editor until it was merged into *The Lutheran*. He was superintendent of English home missions of the General Council from July 1, 1889, until 1894. In the latter year his father, who had established numerous hospitals, orphanages, and other institutions in the United States, died and bequeathed to his son the care and management of these charities. The younger Passavant took up the work, and with ceaseless energy carried it on six years, when he too broke down under the burden. These institutions are: Hospitals at Jacksonville and Chicago, Ill.; hospital and deaconess institution at Milwaukee, Wis.; hospital at Pittsburg, Pa.; orphanage at Zelienople, Pa.; and home for epileptics at Rochester, Pa., with property valued at \$630,000. Both father and son were instrumental in establishing Thiel College, at Greenville, Pa., and the Lutheran Theological Seminary, at Chicago, with property valued at \$225,000, besides indirectly assisting in the founding of other charitable institutions.

Paton, John, philanthropist, born in Ancrum, Scotland, May 26, 1831; died in London, England, March 30, 1901. He was graduated at the University of Edinburgh, and entered the employ of a firm of Liverpool merchants, and later became a clerk in the Bank of British North America in London. He was sent to Kingston, Canada, as an agent of the bank, and in 1869 assumed the duties of its agency in New York city. He continued in this capacity till 1872, when with Morris K. Jesup he established the firm of M. K. Jesup, Paton & Co., which name was subsequently changed to Jesup, Paton & Co., and in 1884 to John Paton & Co., on the retirement of Mr. Jesup. In 1892 Mr. Paton retired and became a partner with Mr. Jesup in the firm of Cuyler, Morgan & Co., from which both gentlemen retired in 1899. Mr. Paton was for many years president of the Society for Improving the Condition of the Poor, and contributed largely to its important philanthropic enterprises.

Patterson, Mrs. Martha, daughter of President Andrew Johnson, born in Greenville, Tenn., Oct. 25, 1828; died there, July 10, 1901. She was the eldest child of President Johnson, and during his administration was mistress of the White House. She was a woman of remarkable intelligence and judgment, and in all his political struggles was his confidante and adviser.

Paul, Charles Rodman, soldier, born in Pennsylvania, Sept. 11, 1843; died in Philadelphia, Nov. 8, 1901. He enlisted as a private in the 7th New Jersey Infantry, Aug. 28, 1861, and served till Aug. 15, 1862. On Aug. 25 he was made a 2d lieutenant of the 15th New Jersey Infantry; 1st lieutenant, Aug. 10, 1863; captain, Sept. 10, 1864; and was mustered out of the volunteer service July 11, 1865. He was brevetted major of volunteers, Oct. 19, 1864, for gallantry

in the campaign in Virginia, and in the engagements at Winchester, Fishers Hill, and Cedar Creek; and lieutenant-colonel of volunteers, April 2, 1865, and captain, March 2, 1867, for gallant and meritorious services before Petersburg. He was commissioned a 2d lieutenant in the 16th Regular Infantry and 1st lieutenant, both on Feb. 23, 1866; transferred to the 25th Infantry, Sept. 21, 1866; to the 18th Infantry, April 26, 1869; commissioned captain, March 20, 1879; major, April 26, 1898; lieutenant-colonel, 20th Infantry, Jan. 29, 1900; and colonel, 30th Infantry, Sept. 27, 1901. He served in Montana, Indian Territory, Kansas, and Colorado, and was in Texas in 1898, when the Spanish War began, when he was ordered to the Philippines and served there till January, 1901.

Paul, John, jurist, born in Rockingham County, Virginia, in 1839; died in Harrisonburg, Va., Nov. 1, 1901. He was educated at Roanoke College, and during the civil war was a lieutenant in the 1st Virginia Cavalry. He was graduated in law at the University of Virginia in 1867, and soon became a notable figure in the politics of his State. He was attorney for the Commonwealth from 1870 to 1877, and in the latter year was elected to the State Senate by the readjuster party. He was member of Congress from 1881 to 1883. In March, 1883, he was appointed United States judge for the Western District of Virginia, and he took his seat in the autumn of that year and served till his death.

Paul, William M., actor, born in England in 1840; died at Canobie Lake, N. H., Jan. 31, 1901. He first appeared in the United States in 1861 in a pantomime under the management of John Ellsler, in Cleveland, Ohio. Later he supported Edwin Booth, Lawrence Barrett, Charles Fechter, Joseph Jefferson, and other stars. His last engagement was with the Castle Square Stock Company, Boston, in 1900. He served in the United States navy during the civil war.

Peabody, Charles Augustus, jurist, born in Sandwich, N. H., July 10, 1814; died in New York city, July 3, 1901. He was graduated at the Harvard Law School in 1837, and began to practise in New York city in 1839. He was a member of the convention that organized the Republican party in New York, in 1855, and was a justice of the New York (State) Supreme Court from 1855 to 1857. In 1858 he was State Commissioner of Quarantine. In 1862 he was appointed judge of the United States Provisional Court of Louisiana. He served as chief justice of the Supreme Court of Louisiana from 1863 to 1865. After retiring from the bench he practised law in New York city until his death. He was for many years vice-president of the Association for the Reform and Codification of the Law of Nations, and was the delegate of the United States to the International Congress of Commercial Law in 1885.

Peakes, James G., singer, born in Boston, Mass., in 1846; died in New York city, Nov. 6, 1901. He was educated in the Boston public schools, and made his first appearance at the Boston Museum as a boy soprano. After studying music and singing publicly in Boston for several years he became a leading tenor of the Holman Opera Company. He next sang with the Caroline Richings Company, and for many seasons sang in support of Clara Louise Kellogg under the management of Max Strakosch. When Miss Kellogg retired from the stage he joined Emma Abbott, and was a member of her company till her death. He then became associated with T. Henry French and staged the first production of *Little Lord Fauntleroy*. Later under the same management

he sang for several seasons in support of Lillian Russell; and afterward under George W. Lederer he sang in many of the comic-opera productions at the Casino in New York.

Perkins, Maurice B., chemist, born in New London, Conn., March 14, 1836; died in Schenectady, N. Y., June 18, 1901. He studied chemistry in 1861-'62 at the Universities of Göttingen, Heidelberg, and Tübingen, in Germany, and in 1862 was appointed Assistant Professor of Chemistry in the College of Physicians and Surgeons, New York city, where he served one year. From 1863 to 1865 he held a similar place in the Lawrence Scientific School of Harvard University. In 1865 he was made Professor of Analytical Chemistry in Union College, and he held that chair till his death. He received the degree of A. M. from Harvard in 1865, and of M. D. from Albany Medical College in 1870. In 1886 he was appointed a member of the State Board of Health of New York, and in later years his time was largely occupied with professional investigations for private concerns and as an expert witness in law trials. He published a *Manual of Qualitative Analysis*.

Pfueger, Carl, opera-singer and composer, born in Passel, Germany, in 1850; died in Cambridge, Mass., May 21, 1901. He sang soprano at the gymnasium of his native town before he was ten years old, and began to study for the operatic stage when he was eighteen years old. He was in active service in the German army during the Franco-Prussian War. His first visit to the United States was with the German Opera Company, in which he sang in New York the leading tenor rôles with Pauline Lucca and other artists. He was the first man to impersonate Lohengrin in America. In 1877 he established himself in Boston as a singer, vocal music teacher, and composer. In 1883 he assumed the directorship of the Orpheus Musical Society of that city. In 1899 he took charge of the Cadet Minstrels in Music Hall, and in 1890 wrote, in collaboration with R. A. Barnet, *Injured Innocence*, the first dramatic production given by the Cadets. In 1892, with Mr. Barnet, he wrote the music for the play of 1492.

Phelps, Thomas Stowell, naval officer, born in Buckfield, Me., Nov. 2, 1822; died in New York city, Jan. 10, 1901. He was a lineal descendant of George Phelps, of Tewksbury, England (a scion of the ancient family of Phyllyppes), who with his brother William became a colonist in 1630 and assisted in founding Dorchester and Westfield, Mass., and Windsor, Conn. The subject of this sketch was appointed a midshipman in the United States navy Jan. 17, 1840, and after six years of sea service was graduated at the Naval Academy in 1846. He served in the Mexican War, and was wrecked in the United States ship *Boston* on Eleuthera island. Afterward he was engaged in the Coast Survey, was on the Mediterranean and Pacific stations, and served throughout the Indian war in Washington Territory in 1855-'56. He participated in the battle of Seattle, where for more than six hours his division was subjected to a furious fire from a vastly superior force of Indians. He was promoted to lieutenant in 1855, was executive officer of the steamer *Westernport* in the Paraguay expedition, and at the beginning of the civil war was attached to an expedition for the relief of Fort Sumter. In June, 1861, he executed a survey and drew a chart of the Potomac river, for the defense of Washington, running the Aquia creek batteries, and was selected to cooperate with the advance movements of the army and navy. In September, 1861, he was transferred to the ship

Corwin for secret service in Virginia and North Carolina waters. He surveyed and buoyed Hatteras inlet for the admission of expeditions into Pamlico and Albemarle Sounds, frequently opposed by a Confederate squadron of gunboats, and on Nov. 14 he engaged and beat off the Confederate gunboat

Curlew, of superior force. In March, 1862, he was assigned to the command of a squadron for the purpose of placing an army corps in the rear of the enemy, was in 3 engagements with the Yorktown and Gloucester Point batteries, and on the evacuation of these places advanced up York river to West Point, capturing 5

Confederate vessels and causing the destruction of 2 others, and thwarted the destruction of the White House bridge. At the battle of West Point he prevented the junction of a large Confederate force with the main army. He made charts of the Mattaponi and Pamunkey rivers, and after the repulse of McClellan was, in compliance with an act of Congress, detailed to survey the Potomac river thoroughly, which was successfully accomplished, although he was opposed by a strong force of the enemy. He became a lieutenant-commander in June, 1862, and during portions of the years 1863-'64 was employed in examining dangers in the way of blockading vessels. He commanded the Juniata at the capture of Fort Fisher, and was afterward transferred to the Lenapee, and was senior officer in the Cape Fear river and adjacent waters to the close of the war. He then served on the Southern coast till 1867, when he was transferred to duty at the California Navy-Yard, having been commissioned a commander in August, 1865. He was promoted to captain in 1871, commanded the Saranac in 1871-'73, and next served as captain of the yard at Mare Island until April, 1877. He commanded the Independence in 1877-'78, and was commissioned commodore in January, 1879. He was commandant of Mare Island Navy-Yard in 1881-'82, and commander-in-chief of the South Atlantic station in 1883-'84. He was promoted to rear-admiral in March, 1884, and after forty-five years of active service was retired in November of the same year. He published *Sailing Directions for the Straits of Magellan* (Washington, 1855); *Reminiscences of Washington Territory* (New York, 1882); and magazine articles.

Pike, Marshall S., song-writer, born in Westboro, Mass., May 20, 1818; died in Upton, Mass., Feb. 13, 1901. He began to write verses and music when he was fourteen years old. In 1843, with John and James Power and L. V. H. Crosby, he formed a quartet called the Albino family. With this and the Harmonicon family he and his songs gained a wide reputation. At the beginning of the civil war he organized a band and went to the front as drum-major with the 22d Massachusetts Regiment. He was taken prisoner at the battle of Gaines Mill, and sent to Libby Prison. While there he organized a glee-club to alleviate the sufferings and shorten the weary hours of the captives. After his release he sang

in New England as a member and part owner of the Pike and Glunn Combination. The best known of his many songs, which were widely popular in the days following the war, are *The Indian Warrior's Grave*; *Lone Starry Hours*; *Washington's Grave*; *Twinkling Stars are Laughing, Love*; and *Home Again*.

Pillsbury, John Sargent, ex-Governor of Minnesota, born in Sutton, N. H., July 29, 1828; died in Minneapolis, Minn., Oct. 18, 1901. After receiving a common-school education he learned the trade of a painter, clerked for a time in his brother's store, later was a merchant tailor in Concord, N. H., and finally settled in St. Anthony (now a part of Minneapolis), in the hardware business in 1855. In 1857 he was burned out, but he continued the business until some years afterward, when he engaged in flour-milling with his nephew, Charles A. Pillsbury. In 1872 he became a partner in the famous firm of Charles A. Pillsbury & Co. When the civil war broke out he organized the 1st, 2d, and 3d Regiments of Minnesota Volunteers. In 1862 he, with others, raised and equipped a mounted company to aid in suppressing an Indian outbreak in Minnesota. In 1863 he became one of the regents of the University of Minnesota, and to him was due the fact that it emerged from early poverty into an era of prosperity. In 1863 he was elected to the State Senate, where he served almost continuously until 1876. He was elected Governor in 1875, and was twice reelected, serving till 1882. During his term he prevented the repudiation of the Minnesota State Railway bonds, and did much to assist the farmers that had been impoverished by the grasshopper plague. In 1889 he built and gave to the university Science Hall, at a cost of \$150,000. He presented a handsome town hall to Sutton, N. H., and built in Warner, N. H., the Pillsbury Free Library, and in Concord, N. H., the Margaret Pillsbury Hospital. In 1900 he gave to East Minneapolis a branch public library, and joined his wife in the support of the Home for Working Girls, in Minneapolis, to the permanent fund of which he gave \$100,000.

Pingree, Hazen S., ex-Governor of Michigan, born in Denmark, Me., Aug. 30, 1840; died in London, England, June 18, 1901. At the age of fourteen he was working in a cotton factory in Saco, Me.; in 1860 he was employed in a shoe factory in Hopkinton, Mass. In 1862 he enlisted as a private in the 1st Massachusetts Heavy Artillery, and he served through the war. He participated in the second battle of Bull Run, and the battles of Fredericksburg, Spottsylvania, Cold Harbor, and North Anna. In 1864 he was captured and was a prisoner five months. In August, 1865, he was mustered out and returned to Hopkinton. Soon afterward he went to Detroit, Mich., where for a time he was employed in a boot and shoe factory. In December, 1866, he formed a partnership with C. H. Smith to manufacture shoes, and their business increased till the annual output represented \$1,000,000. In 1889 he was elected mayor of Detroit by the Republican party by 2,318 majority, overcoming a normal Democratic majority of 3,000. He was three times reelected—in 1891, 1893, and 1895—by increased majorities each time. As mayor he accomplished many municipal reforms. His plan to turn over the city's unoccupied lands for the cultivation of potatoes by the poor was extensively noticed. He was elected Governor of Michigan in 1896, was reelected in 1898, and retired in 1900 after a stormy time with the Legislature, but chiefly relating to reforms in the taxation of steam railroads.

Pollock, Robert, soldier, born in Philadelphia, Pa., Sept. 17, 1819; died in Cornelius, Ore., Feb. 24, 1901. He enlisted as a sergeant of Virginia volunteers, Jan. 6, 1847; became a 2d lieutenant, May 6; served through the Mexican War; and was mustered out July 31, 1848. He became major of the 3d California Infantry Sept. 4, 1861, and was made lieutenant-colonel Dec. 12, 1861; colonel, March 29, 1863; and was mustered out Nov. 14, 1864. He was then made lieutenant-colonel of the 2d California Infantry, Jan. 7, 1865, and served till June 23, 1866. He was brevetted, March 13, 1865, colonel of volunteers for faithful service during the war. He was appointed 1st lieutenant, 32d Infantry, July 28, 1866; transferred to 21st Infantry, April 19, 1869; commissioned captain, Feb. 19, 1873; and retired Sept. 17, 1883. He was brevetted major, Feb. 27, 1890, for marked bravery and gallant services against the Indians at the Clearwater, Idaho, July 11 and 12, 1877.

Ponisi, James, actor, born in England in 1819; died in New York city, Sept. 12, 1901. After considerable experience in the London theaters during his early manhood, he came to America in 1851, and made his first appearance in Buffalo, N. Y. He played throughout the United States, supporting Joseph Jefferson for a time, and during another period acting as business manager for the elder Sothern, who was then playing Lord Dundreary. Mr. Ponisi retired from the stage about 1881. His first wife was known as Mme. Ponisi, a distinguished member of Wallack's Theater Company. They were divorced, and he afterward married an American who was not connected with the theatrical profession.

Porter, Fitz John, soldier, born in Portsmouth, N. H., June 13, 1822; died in Morristown, N. J., May 21, 1901. He was graduated at West Point in 1845, and assigned to the 4th Artillery as brevet 2d lieutenant; he was promoted 2d lieutenant, June 18, 1846; 1st lieutenant, May 29, 1847; colonel, 15th Infantry, May 14, 1861; cashiered, Jan. 21, 1863; restored to duty as colonel of infantry, Aug. 5, 1886, to rank from May 14, 1861; and retired Aug. 7, 1886. In the volunteer service he was appointed brigadier-general, May 7, 1861; major-general, July 4, 1862. In the Mexican War he was brevetted captain, Sept.

8, 1847, for services at Molino del Rey, and major, Sept. 13, 1847, for Chapultepec. He was on garrison duty till July 9, 1849, when he was appointed assistant instructor of artillery at West Point; he served there successively as assistant instructor in natural and experimental philosophy, adjutant of the Military Academy, and instructor of artillery and cavalry till 1855. In 1857-'60 he served under Gen. Johnston in the Utah expedition. In 1860 he became assistant inspector-general, with headquarters in New York city. In April, 1861, he was on duty in the adjutant-general's office in Washington; he superintended the protection of the railroad between Baltimore and Harrisburg during the Baltimore riots. As brigadier-general of volunteers he was assigned for a time to duty in Washington. In 1862 he participated in the Peninsular campaign, and after the evacuation of Yorktown, May 4, was Governor of that place for a brief period. He

commanded the 5th Army Corps at the battles of Mechanicsville, June 26; Gaines Mill, June 27; and Malvern Hill, July 1, 1862. He was brevetted brigadier-general in the regular army for gallant conduct at Chickahominy. As major-general of volunteers he was temporarily attached to Gen. Pope's Army of Virginia. On the first day of the second battle of Bull Run his corps, though ordered to advance, was unable to do so, but the next day was actively engaged. Charges of inaction were brought against him, and he was deprived of his command. At the request of Gen. McClellan he was restored, and took part in the Maryland campaign. Nov. 27, 1862, he was arraigned before a court-martial in Washington, and after a two months' trial was cashiered, Jan. 21, 1863. The justice of the verdict was the subject of much controversy. He made numerous appeals for its reversal, and on May 4, 1882, the President remitted so much of the sentence as disqualified him from holding office under the Government. Subsequently a bill for his relief was passed by Congress and he was restored to the United States army as colonel, Aug. 5, 1886, and retired two days later. In 1864-'65 he superintended mining operations in Colorado. Later for several years he was in business in New York city. From 1872 till 1875 he was superintendent of the New Jersey State Insane Asylum; from 1875 till 1877 he was commissioner of public works in New York city; from 1877 till 1882 he was assistant receiver of the Central Railroad of New Jersey. He was police commissioner of New York city from 1884 till 1888, and fire commissioner for a year. He was cashier of the New York post-office in 1893-'97.

Porter, Samuel, educator, born in Farmington, Conn., Jan. 12, 1810; died there, Sept. 2, 1901. He was a son of Dr. Noah Porter, and was graduated at Yale in 1829. In 1832-'36 and in 1846-'66 he was instructor of the deaf and dumb in the Hartford institution. He taught in the New York institution from 1843 to 1846, and from 1854 to 1860 he was editor of the American Annals of the Deaf and Dumb. In 1866 he became Professor of Mental Science and English Philology in Gallaudet College, and in 1884 he was retired as professor emeritus. He was the author of the Guide to Pronunciation prefixed to Webster's International Dictionary, of papers read before the American Philological Association, and of articles in magazines.

Porter, Thomas Conrad, educator, born in Alexandria, Pa., Jan. 22, 1822; died in Easton, Pa., April 27, 1901. He was graduated at Lafayette College in 1840, and at Princeton Theological Seminary in 1843, and was a missionary in Georgia till Nov. 14, 1848, when he was made pastor of the Second German Reformed Church, Reading, Pa. The following year he became Professor of the Natural Sciences in Marshall College; and when that college united with Franklin College he held the same chair till 1866, when he became Professor of Botany, Zoology, and General Geology in Lafayette College. On Jan. 1, 1897, he was made professor emeritus, curator of the botanical collections, and dean of Pardee Scientific School. He served as pastor of the Third Street Reformed Church, Easton, Pa., from 1877 to 1888. Rutgers conferred upon him the degree of D. D. in 1865, and Franklin and Marshall that of LL. D. in 1880. He worked over the Hayden botanical collections made in the Rocky mountains in 1870 to 1874, and his collection of the flora of Pennsylvania is the largest and most complete in existence. His name was given to a genus of plants (*Porteranthus*) belonging to the rose family, of which there

are about eighty species. He was a prolific writer on a wide range of subjects. He was the earliest champion of Finnish literature, and in 1854 drew attention to the similarity in form and spirit between Longfellow's poem *Hiawatha* and the Finnish national epic *Kalevala*. He published the *Synopsis of the Flora of Colorado* and a *Botany of Pennsylvania*.

Potter, Eliphalet Nott, educator, born in Schenectady, N. Y., Sept. 20, 1836; died in the city of Mexico, Feb. 6, 1901. He was the youngest son of Alonzo Potter, Protestant Episcopal Bishop of Pennsylvania, and was graduated at Union College in 1861, and at Berkeley Divinity School in 1862. He was rector of the Protestant Episcopal Church of the Nativity, in South Bethlehem, Pa., from 1862 till 1869. From 1866 till 1871 he was secretary and Professor of Ethics in Lehigh University, and from 1869 till 1871 he was associate rector of St. Paul's Protestant Episcopal Church, Troy, N. Y. In 1871 he was elected president of Union College, and he was chosen for the office of chancellor when through his efforts the college became a university in 1873. He resigned the chancellorship in 1884, and accepted the presidency of Hobart College, which office he administered till 1897. Later he became president of the Cosmopolitan University, designed to give university instruction by means of correspondence courses.

Powell, William H., soldier, born in Washington, D. C., Sept. 28, 1838; died in Sacketts Harbor, N. Y., Nov. 16, 1901. At the outbreak of the civil war he was a private in Washington, D. C., Light Infantry, and with his company volunteered for the protection of the capital. The company was mustered into the National service April 17, 1861, and mustered out July 17, 1861. He was then appointed 2d lieutenant in the 4th Infantry, Oct. 24, 1861. He was acting adjutant from Feb. 14 to 28, 1862, and acting assistant adjutant-general of the 1st brigade of Regular Infantry, 2d division, 5th Army Corps, participating in the Peninsula, the Maryland, and the Fredericksburg campaigns. Sept. 16, 1862, he was appointed 1st lieutenant. He was brevetted captain Sept. 17, 1862, for gallant and meritorious services in the battle of Antietam. May 4, 1864, he rejoined the Army of the Potomac, participating in the Wilderness campaign and the Petersburg campaign. He was chief of ordnance and artillery, New York city and harbor, Aug. 1 to Oct. 24, 1865, and participated in the suppression of the Fenian raid into Canada in 1866. Aug. 5, 1888, he was appointed major of the 22d Infantry, and May 4, 1892, was appointed lieutenant-colonel and assigned to the 11th Infantry. He was appointed colonel of the 9th Infantry June 27, 1897, accompanied the regiment to Tampa in April, 1898, and was made acting brigadier-general and assigned to the 1st division of the 5th Army Corps. He joined his regiment in Santiago de Cuba, July 20, returned with it to Montauk, Aug. 13, and finally to Madison Barracks, Sept. 11. He was retired at his own request, April 25, 1899. Col. Powell was the author of the following books: *History of the Fourth Infantry* (1881); *Tactical Queries for Infantry* (1884); *Records of Living Officers, U. S. Army* (1890); *Officers [Regular] who served in the Civil War* (1892); *Army Officers' Examiner* (1894); *History of the Fifth Army Corps* (1895). He was known as the army historian.

Prentiss, Benjamin Maybury, soldier, born in Belleville, Va. (now W. Va.), Nov. 23, 1819; died in Bethany, Mo., Feb. 8, 1901. He removed with his parents to Missouri in 1835, and in 1841

settled in Quincy, Ill., where he learned rope-making and subsequently engaged in the commission business. In 1844 he was 1st lieutenant of a company to be sent against the Mormons at Hancock, Ill. As a captain of volunteers he served with distinction through the Mexican War, and was honorably mentioned for his services at Buena Vista. At the beginning of the civil war he reorganized his old company, and offered its services to the Government. He was appointed colonel of the 7th Illinois Regiment, and May 17, 1861, became brigadier-general of volunteers. He was placed in command at Cairo, Ill., and afterward served in southern Missouri, where he routed a large body of Confederates at Mount Zion, Dec. 28, 1861. He joined Gen. Grant at Pittsburg Landing three days before the battle of Shiloh, in which he commanded the 6th division, consisting of two regular army brigades and several regiments of volunteers. On the first day of the battle, April 6, 1862, Gen. Prentiss was assigned to a position, and having no orders to retreat, stubbornly held his ground until late in the afternoon, when he was surrounded and captured with almost his entire command. He was a prisoner until October, 1862. On Nov. 29 he was made major-general of volunteers. He served on the court-martial that was convened to try the case of Gen. Fitz John Porter, in November, 1862. He commanded the post at Helena, Ark., in 1863, where, on July 3d, he was attacked by the Confederates under Gens. Holmes and Price, whom he signally defeated. Gen. Prentiss resigned his commission Oct. 28, 1863, and in later life practised law in Bethany, Mo.

Ramsey, John, soldier, born in New York city, Oct. 7, 1838; died in Jersey City, N. J., Feb. 11, 1901. At the outbreak of the civil war he enlisted in the 2d New Jersey Infantry, and on the expiration of his three months' term of service reenlisted in the 5th New Jersey and was commissioned captain. He was made a major in May, 1862, for bravery in the field, and in October of the same year was appointed lieutenant-colonel. In October, 1863, he was made colonel of the 8th New Jersey Volunteers. In December, 1864, he was brevetted brigadier-general for conspicuous bravery, and on March 13, 1865, was brevetted major-general. He took part in the battles of Bull Run, Yorktown, Chantilly, Fredericksburg, Chancellorsville, Gettysburg, the Wilderness, Spottsylvania, Cold Harbor, Petersburg, and Hatcher's Run, and was wounded 17 times. At Fredericksburg he attracted the attention of Gen. Miles and was recommended by him for promotion. He was also recommended for promotion by Gen. Meade. He was for a time collector of the port of Jersey City.

Ranck, George W., author, born in Louisville, Ky., Feb. 13, 1841; died in Lexington, Ky., Aug. 2, 1901. He studied at the University of Kentucky, and was the historian of his State. His statements as to the location of the original log fort erected near Lexington in pioneer days as a protection against the Indians had been attacked by other historians, and while walking the track near the site, collecting data in support of his argument, he was struck by a railroad train and killed. He was the author of *History of Lexington, Ky.* (1872); *Girty, the White Indian*; *The Traveling Church* (1891); *The Story of Bryan's Station* (1896); *The Bivouac of the Dead and its Author* (1898); and *Boonesborough* (1901).

Ransom, Chauncey Monroe, insurance underwriter, born in Erie County, New York, April 18, 1831; died in Boston, Mass., Dec. 9, 1901. He went to Cincinnati, where from 1858 to 1867 he

solicited fire insurance. In 1868 he was elected vice-president of a life insurance company and the representative of a St. Louis company. In September, 1871, he purchased an interest in the Baltimore Underwriter, and in 1878 the Boston Index, which he changed to the Standard, of which he was editor till his death. In 1883 he organized the Boston Life Underwriters' Association, out of whose influence grew the National Association of Life Underwriters, organized in Boston in June, 1890.

Rathbone, John Finley, manufacturer, born in Albany, N. Y., Oct. 12, 1819; died there, March 20, 1901. He was educated at the Albany Academy and the Collegiate Institute, Brockport, N. Y. In 1845 he established in Albany a stove foundry that, under the name of Rathbone, Sard & Co., has become the largest in the world. He was brigadier-general of the 9th Brigade, New York National Guard, from 1861 to 1867, and when, at the beginning of the civil war, Albany was made a depot for volunteers, Gen. Rathbone was appointed commandant. He equipped and sent into the field 34 regiments, and was commended by the War Department for his services. He was appointed adjutant-general of the State troops, with the rank of major-general, by Gov. Dix, Jan. 1, 1873, and served with distinction in that capacity during the latter's administration. Throughout his life he was active in religious, educational, and charitable work. He was one of the founders of the Albany Orphan Asylum; was for fifty years superintendent of the Emanuel Baptist Sunday-school; was a director of many educational and charitable institutions; and gave to the University of Rochester \$40,000 as a foundation for a library.

Read, Josiah M., inventor, born in Sandwich, N. H., April 1, 1809; died in Everett, Mass., Nov. 6, 1901. He was educated in the schools of his native town, and at the age of nineteen removed to Rockland, Mass., where he learned the trade of wheelwright. In 1839 he began, in Boston, inventing, manufacturing, and dealing in patent stoves and appliances. He is said to have invented the first cooking-range in 1846. He continued in active business till 1888. He served in the State Legislature from 1861 to 1863.

Bearick, Peter Anton, naval officer, born in Maryland, Nov. 12, 1838; died in Washington, D. C., Feb. 9, 1901. He was appointed to the navy as a third assistant engineer Feb. 17, 1860, and served through the civil war, receiving the appointments of second assistant engineer, July 22, 1862, and first assistant engineer, March 1, 1864. He was made passed assistant engineer Feb. 24, 1874, and chief engineer, March 25, 1874. After the war he was on duty with the Pacific Squadron, and on the North and South Atlantic, European, and Asiatic stations, besides serving at various navy-yards and as a member of the Steel Inspection Board. He was retired as a rear-admiral Feb. 7, 1900.

Reed, Roland Lewis, actor, born in Philadelphia, Pa., June 18, 1852; died in New York city, March 30, 1901. His father was connected with the Walnut Street Theater, Philadelphia, and Roland Reed made his first theatrical appearance there as an infant in arms, afterward playing juvenile characters as soon as he was old enough to speak the lines. When the youth grew older he became stage-doorkeeper of the Walnut Street Theater, occupying that place for several seasons. He then went to Mrs. John Drew's Arch Street Theater as an usher, but soon became the prompter. His real training as an actor began at this time. The company was very fine, and during an

engagement of Lotta, the comedienne, in *The Fire-fly*, the leading man was taken ill and his rôle was assigned to Reed. The young actor was so successful in this performance that he was engaged immediately as a regular member of the dramatic company. Soon after this he returned to the Walnut Street Theater, playing low-comedy rôles. In the season of 1870-'71 Mr. Reed became leading man at this theater, and during seven succeeding seasons he held a similar place in the stock companies at the Academy of Music, New Orleans; the Olympic Theater, St. Louis; the Academy of Music, Cleveland; and McVickar's Theater, Chicago. After playing for a season in the Colville Folly Company, he secured the rights to Augustin Daly's *An Arabian Night*, and began his first starring tour in 1880. In 1881-'82 he played *Jewell* in the English melodrama, *The World*. In the autumn of 1882 he appeared in Chicago in the play of *Cheek*, scoring a great success. He continued with this play, and with a similar production entitled *Humbug*, until 1885, when for a short time he abandoned his starring tour to create the character of *Koko* in the American production of Gilbert and Sullivan's opera, *The Mikado*. In 1887 he again appeared successfully as a star in *The Woman-Hater*, following this with productions of *Lend Me your Wife*, *The Bridal Trap*, *The Club Friend*, *Innocent as a Lamb*, *The Politician*, *A Man of Ideas*, and *The Wrong Mr. Wright*, in nearly all of which he won distinction as an actor besides greatly increasing his fortune. In 1898-'99 he played in *His Father's Boy*, continuing with this piece throughout the season. In December, 1899, he was obliged to end his tour suddenly on account of illness, and he did not appear again until early in the autumn of 1900, when he opened at the Boston Museum in *A Modern Crusoe*. He took this play to Chicago, but in October, 1900, failing health again obliged him to close his season abruptly, and this was his last public appearance. Mr. Reed was a brilliant and versatile actor, a man of high character, and a great favorite with the public and among his friends. He married, in 1877, Miss Johanna Summers, of Philadelphia.

Reid, James Douglas, telegrapher, born in Edinburgh, Scotland, March 22, 1819; died in New York city, April 28, 1901. In 1834 he removed with his family to Toronto, Canada, where he took a place as junior clerk in a bank. He removed to Rochester, N. Y., in 1837, and became a clerk in the post-office under Henry O'Reilly. In Rochester he became acquainted with S. F. B. Morse, and studied with him. In 1845 O'Reilly secured a contract for constructing a telegraph-line from Philadelphia to Pittsburg, from Amos Kendall, then Prof. Morse's agent and attorney. Mr. Reid was made an assistant to Mr. O'Reilly in the construction of the line, and was assigned to the building of the first section, from Lancaster to Harrisburg. His next appointment of importance was as superintendent of the Magnetic Telegraph Company, a line from New York to Washington, and also as superintendent of the Atlantic and Ohio Telegraph Company, with a line from Philadelphia to Pittsburg. In 1856, when the Western Union Company began to absorb lines, Mr. Reid was made superintendent of the New York, Albany and Buffalo Telegraph Company, which was soon afterward absorbed by the Western Union. Several other companies with which he was connected were taken in subsequently. In the early fifties he founded and edited the *National Telegraph Review*, and in 1877 he published the first edition of the *Telegraph in America*. He also contributed many

articles to magazines. At the convention of telegraphers in Pittsburg in 1886 he received a gold medal in consideration of his services, and he received in 1899 a similar honor from the New York Telegraph Club. Mr. Reid was United States consul at Dunfermline, Scotland, from 1889 to 1897.

Revels, Hiram R., Senator, born in Fayetteville, N. C., Sept. 1, 1822; died in Aberdeen, Miss., Jan. 16, 1901. He was a quadroon, the son of free colored parents, and was educated in the Friends' Seminary, in Liberty, Ind. He was ordained a minister in the African Methodist Episcopal Church, lectured throughout the North, and became a leader among the negroes of Ohio, Illinois, Indiana, and Mississippi. During the civil war he assisted in organizing colored regiments in Maryland and in St. Louis, Mo., and followed the Federal army to Jackson, Miss., preaching to the emancipated slaves. In the years following the war he was one of the most influential of his race. He was elected to the State Senate in Mississippi in 1869, and in February, 1870, was sent to the United States Senate from that State and served till March 4, 1871. For many years he was president of Alcorn Agricultural University for Negroes, at Rodney, Miss., and at the time of his death he was presiding elder of the Holly Springs District Conference of his Church.

Riggs, Elias, missionary and linguist, born in New Providence, N. J., Nov. 19, 1810; died in Scutari, Turkey, Jan. 17, 1901. He was graduated at Amherst College in 1829, and at Andover Theological Seminary in 1832. He was a missionary of the American Board in Athens and Argos from 1832 to 1838; in Smyrna, from 1838 to 1853; and in Constantinople, from 1853 till his death. He returned to the United States only once—in 1856—and being delayed by the publication of his Armenian Bible, taught Hebrew in Union Theological Seminary in 1857 and 1858. His translations of the Bible into Armenian and Bulgarian are the standard editions. He assisted largely in the revision of the Turkish Bible in Arabic and Armenian characters in 1873 to 1878 and in 1883 to 1886. Dr. Riggs was the author of *A Manual of the Chaldee Language*; *Chrestomathy*, and a *Vocabulary* (1832); *The Young Forester: A Memoir of the Swedish Missionary Fjellstedt*; *Grammatical Notes on the Bulgarian Language* (1844); *Grammar of the Modern Armenian Language* (1847); *Grammar of the Turkish Language as Written in the Armenian Character* (1856); *Translation of the Scriptures into the Modern Armenian Language* (completed with the aid of native scholars in 1853); *Translation of the Scriptures into the Bulgarian Language* (completed with the aid of native scholars in 1871); *Notes on Difficult Passages of the New Testament*; *A Harmony of the Gospels, in Bulgarian*; a *Bible Dictionary, in Bulgarian*; and many tracts and hymns in Greek, Armenian, and Bulgarian.

Roberts, James Booth, actor, born in Newcastle, Del., Sept. 27, 1818; died in Elizabeth, N. J., Sept. 14, 1901. He made his first appearance at the Walnut Street Theater, Philadelphia, as Richmond in *Richard III*, Junius Brutus Booth playing *Richard*. After this engagement he devoted himself for two years to the study of dramatic art, and then appeared again at the same theater in an unimportant rôle, supporting Edwin Forrest. For the next eight years he played minor rôles in various stock companies, but during this period he was gradually making a prominent place for himself in the profession. On Feb. 12, 1847, he made his first appearance in New York, at the old Chatham Street Theater,

as *Richard III*, and during one week he played the leading rôles in a repertoire that included *The Iron Chest*, *The Stranger*, *Othello*, *Hamlet*, and *Macbeth*. This engagement was so successful that he appeared again in New York, playing the characters of *Romeo*, *Shylock*, *Jaffier*, *St. Pierre*, and *Rolla*. Soon after this he made a tour of the United States, appearing in classic rôles. In 1856 he went to England, making his first appearance at Drury Lane Theater, London, Sept. 21, as *Sir Giles Overreach* in *A New Way to Pay Old Debts*, after which he played in Liverpool, Manchester, Dublin, Limerick, and Belfast, covering a period of eighteen months. He then returned to America and wrote an English adaptation of *Goethe's Faust*, which he produced in Philadelphia, playing the character of *Mephistopheles*. Some time after this he appeared as *Hertzog* in the famous spectacular production known as *The Black Crook*, in which rôle he made a great success. He traveled for many seasons throughout the United States, playing *Mephistopheles* in his adaptation of *Faust* until 1876, when he practically retired from the stage, devoting himself thereafter to teaching elocution and dramatic art. Mr. Roberts was one of the first native-born American actors, and was one of the founders of the Shakespeare Birthday Club of New York. He was never married.

Roberts, Lewis A., publisher, born near Ballington, England, Dec. 6, 1833; died in Lakewood, N. J., Jan. 23, 1901. He removed to the United States about 1840 with his father, who settled on a large country place near New Bedford, Mass. In 1849 young Roberts went to Boston, where he first engaged in trade, and in 1859 established the firm of Roberts Brothers, bookbinders, photograph-album makers, and book-publishers, which within five years became one of the largest in the country. The brother, who was the first partner, retired within two years after the founding of the firm, and Lewis Roberts was its sole owner till 1872, when he admitted his brother-in-law, Thomas Niles, as a partner. Mr. Niles died in 1894, and Mr. Roberts continued at the head of the business till compelled by failing health to resign in 1899. Mr. Roberts studied landscape painting under Oudinot, and was a man of broad literary culture. The publications of his house were of the highest order, and the larger part of his ventures were eminently successful. One of his greatest successes was the series of children's books by Louisa M. Alcott. Other authors that he did much toward introducing to the American public are Edward Everett Hale, Helen Hunt Jackson (H. H.), Olive Schreiner, Robert Louis Stevenson, Mrs. Ewing, William Morris, George Meredith, Dante G. Rossetti, Christina G. Rossetti, Sir Edwin Arnold, Philip G. Hamerton, and Jean Ingelow.

Roe, Francis Asbury, naval officer, born in Elmira, N. Y., Oct. 4, 1823; died in Washington, D. C., Dec. 28, 1901. His great-grandfather was Benjamin Roe, who was killed near Lake Champlain in 1756 while serving in the French and Indian War; his grandfather, John Roe, was a minuteman in the New York line, and later a quartermaster in the 1st Regiment of the Suffolk County Militia during the War of the Revolution, and his father was Isaac Roe, who was a sergeant in the New York State Militia during the War of 1812. His early years were spent in Elmira, where his father possessed a large estate. On Oct. 19, 1841, he entered the United States navy as acting midshipman, serving on the *John Adams* and the *Yorktown* at various stations until 1846, when he was ordered to the *Boston*,

bound to the Gulf of Mexico to join the squadron under Perry blockading Vera Cruz, but was shipwrecked on Eleuthera island, West Indies. Subsequently he served on the Alleghany, and on Oct. 20, 1847, was ordered to the Naval Academy,

where, in 1848, he was graduated and promoted to passed midshipman. On Sept. 26, 1848, he was ordered to the Albany, and cruised among the West India islands, and in 1849 was dismissed the service, by sentence of court-martial, for disobedience of an illegal order, but a year later was re-appointed to the service, with original rank and place on the navy

list. During 1850-'52 he was executive officer of the mail-steamer Georgia, and on Dec. 27, 1852, was ordered to the Porpoise, of the North Pacific and Bering Strait Expedition, to serve in a similar capacity. While in China he had an action with a fleet of 13 heavy-armed pirate junks in Koulan Bay. He defeated the pirate fleet, destroying 6 junks, and dispersing the remainder, in a heated action of two hours, fought under canvas under way. In August, 1854, he was transferred to the Vincennes, the flagship of the exploring expedition, serving as executive officer of that vessel, in which he cruised in the arctic regions as far north as 72° 5' and along the north and east coast of Siberia, and Japan and the Kurile Islands. He was promoted to lieutenant in September, 1855, and in November was detached from the Vincennes and ordered to the service of the Coast Survey, with which he continued until April, 1858, when he was assigned to the Macedonian, on which he cruised in the Gulf of Mexico and in the Mediterranean. Soon after the expiration of that cruise he was assigned to ordnance duty in the New York Navy-Yard, where he remained until July, 1861, when he was ordered to the Pensacola, and served as executive officer during the passage of that ship down the Potomac river through 9 miles of batteries and under constant fire. He then carried the Pensacola to New Orleans, where he joined Farragut and led the starboard column of that fleet during the battle and passage of Forts Jackson and St. Philip, and, 80 miles above, the Chalmette batteries. For his conduct on this occasion he was specially commended, and recommended for promotion. In August, 1862, he was ordered to the command of the gunboat Katahdin, and on Aug. 5 he fought the battle of Baton Rouge against John C. Breckinridge. In February, 1863, he was sent north on account of failing health, but in the meanwhile had participated in fights at Plaquemine, Bonnet Carré, College Point, and the engagement with the Confederate ram Arkansas. In August, 1863, he received command of the Sassacus, which served on the blockade off Wilmington, where he destroyed 2 blockade-runners. At Norfolk, Va., had been collected large quantities of stores, and, in order to secure possession of these, an iron ram had been constructed by the Confederates, with which they sought to destroy the Union fleet in

Albemarle Sound. On May 5 the Albemarle came down the Sound accompanied by the Bombshell and engaged the National vessel. The squadron had been pouring ineffective shot on the iron sides of the ram for some time when it occurred to Roe that by striking the ram under water by the sharp false stem of the Sassacus he might disable her. With a speed of 9 or 10 knots, the black hull of the iron ram was struck with a right-angle blow. At the moment when this occurred a shot burst the boilers of the Sassacus, setting free a dense cloud of vapor, which enveloped both the contestants. For a quarter of an hour the two boats were held in close embrace and the guns were served, firing muzzle to muzzle. Hand grenades were thrown from the fore-top of the Sassacus into the enemy's hatch, driving back the sharpshooters and creating consternation among the closely packed crew of the ram. When the two boats separated, the Albemarle retreated up the Sound. The attendant gunboat Bombshell surrendered to the Sassacus early in the engagement. A contemporary account describes the brave commander as "firmly enunciating his instructions and orders, and guiding every movement of his gallant ship with a coolness, precision, and relentless audacity that find no parallel since the days of Decatur and Bainbridge, displaying a perfect indifference to danger worthy of one of Farragut's salamanders." After some months in the hospital Roe received command of the Michigan, then serving on the Great Lakes, and quelled an insurrection of the miners of the iron region at Marquette and the copper region at Houghton. A privateer, which had been equipped by the miners, was pursued by him into English waters, and was taken possession of by British authorities at Collingwood, Canada. After further service in various capacities, in January, 1867, he received command of the Tacony, was ordered to Vera Cruz, and was active in the negotiations that led to the surrender of that town, the commander of which, refusing to surrender to the Republican forces, after Maximilian had been executed, turned the city over to Commander Roe, who established a provisional government until the city was occupied by the Republican troops under Gen. Benavidez. At this time he took the famous agitator Santa Anna a prisoner out of an American steamer, and sent him away from the scene of action. For his skilful handling of a delicate matter he was, on his return to Washington, publicly thanked and congratulated by President Johnson, in the presence of his Cabinet. Subsequently he served as fleet captain on the Asiatic station, having command of the Delaware, and was promoted captain April 1, 1872. In 1873 he was made executive officer of the Boston Navy-Yard, and a year later he received command of the Lancaster, in which he cruised on the Brazilian station. In 1875 he was ordered to New London, and subsequently he served on various boards and was governor of the Naval Station for Retired Seamen, at Philadelphia, where he remained until his retirement in October, 1885. He was commissioned rear-admiral Nov. 3, 1884. Washington then became his permanent residence, and he devoted his leisure to literary studies, contributing frequently to magazines.

Rogers, Jacob S., manufacturer, born in Paterson, N. J., about 1820; died in New York city, July 2, 1901. His father, Thomas Rogers, settled in Paterson in 1814, and was a pioneer locomotive builder. He was a partner in and succeeded to the business of Rogers, Ketcham & Co., of Paterson. Jacob S. Rogers succeeded his father upon

his death in 1856, and continued as the active head of the business till 1897. During and after the civil war the business prospered greatly, and Mr. Rogers amassed a fortune, though he eccentrically adhered to the most conservative methods. The greater part of his fortune, more than \$5,000,000, he left to the Metropolitan Museum of Art in New York city.

Rogers, John Rankin, Governor of Washington, born in Brunswick, Me., Sept. 4, 1838; died in Olympia, Wash., Dec. 26, 1901. He was educated in the common schools. From 1852 to 1856 he was in a drug-store in Boston, and in the latter year he became manager of a similar store in Jackson, Miss. In 1861 he removed to southern Illinois, where he taught school till 1866, and then engaged in farming. He returned to Maine in 1870, and for five years conducted a drug-store in his native town. In 1876 he became a farmer in Kansas. He was one of the organizers of the Farmers' Alliance in 1878, and after that time took an active interest in politics. As a green-back Republican he was elected to several minor offices. In 1887 he established, at Wichita, the Kansas Commoner, one of the most influential Populist papers in the State. He removed to Puyallup, Wash., in 1890, and went into the real-estate business. In 1894 he was elected to the Legislature. In 1896 he was elected Governor of Washington for four years, and in 1900 he was reelected. Mr. Rogers was author of "the bare-foot schoolboy" law, and he was one of the few of the Populist legislators that would not ride on a railway pass. Besides his contributions to the Populist newspapers, he was the author of 3 books, widely circulated in the West: *The Irrepressible Conflict*, *Looking Forward*, and *The Inalienable Rights of Man*.

Roper, Jesse Mimms, naval officer, born in Glasgow, Mo., Oct. 29, 1851; died at Cavité, Luzon, Philippine Islands, March 31, 1901. He was graduated at Annapolis in 1872, and received his commission as ensign, July 15, 1873; as master, Nov. 25, 1877; as lieutenant (junior grade), March 3, 1883; as lieutenant, June 5, 1884; and as lieutenant-commander, March 3, 1899. He served on the Supply and the Fortune till July, 1879, when he was ordered to the practise-ship Constellation. After 1882 he was on the Lackawanna, and at the Naval Academy, and the Naval War College from 1886 to 1889. He was ordered to the Petrel in October, 1889, and returned to the Naval Academy in September, 1891. He was assigned to the New York in July, 1894, and to torpedo instruction on the Cushing in September, 1894. A short service as a member of the Naval Examining Board was followed by his assignment to Mare Island, and thence to the training-ship Independence. He was assigned to the Monadnock in February, 1896; for a short time served as assistant inspector, 3d Lighthouse District, Tompkinsville, N. Y.; and March 23, 1898, was made executive officer of the Mayflower. He served with distinction on this vessel through the Spanish War. In October, 1899, he was made executive officer of the Dixie, and Nov. 15, 1899, was assigned to the command of the Petrel. In a brave attempt to rescue members of the crew of his ship, which was on fire, he lost his life. After one attempt, he had returned to the deck, but returned against the advice and wishes of his officers. Commander Roper was a skilled mathematician, and of his shore duty twelve years were spent in teaching at Annapolis.

Ross, Leonard Fulton, soldier, born in Fulton County, Illinois, July 18, 1823; died in Galesburg, Ill., Jan. 18, 1901. His father was the founder

of Lewistown, Ill. Gen. Ross was a veteran of the Mexican and civil wars, having served with distinction in both. He was a collector of internal revenue under President Johnson.

Rothwell, Richard Pennefather, mining engineer, born in Ingersoll, Ontario, Canada, May 1, 1836; died in New York city, April 16, 1901. He was graduated at the Rensselaer Polytechnic Institute, Troy, N. Y., in 1858; at the Imperial School of Mines, Paris, France, in 1862; and later studied at Freiburg, Saxony. He engaged in the manufacture of telegraph-cable and wire rope in London, England, in 1864-'65; then practised as a civil and mining engineer in Pennsylvania from 1866 till 1873. In the field of mining and in the treatment of ores he made many inventions and improvements. A contour map he made in 1869 of the anthracite strata of the Panther Creek valley for the Lehigh Coal and Navigation Company is still in use. Complete surveys and contour maps of the Wyoming valley and Cahaba coal-fields which Mr. Rothwell made have been adopted by the Pennsylvania and United States geological surveys. In 1873 he became editor and manager of the *Engineering and Mining Journal* in New York. For his *Mineral Industry: Its Statistics, Technology, and Trade*, an annual cyclopædia of mining, metallurgy, and industrial chemistry, he received the gold medal of the Société d'Encouragement pour l'Industrie Nationale of Paris. He also published *Universal Bimetallism* and *An International Monetary Clearing-House*, and compiled the gold and silver statistics for the United States census of 1890.

Rowland, Henry Augustus, physicist, born in Honesdale, Pa., Nov. 27, 1848; died in Baltimore, Md., April 16, 1901. He was graduated at Rensselaer Polytechnic Institute, Troy, N. Y., with the degree of C. E. in 1871, and after a year's experience in engineering in railroad work he became a teacher in Wooster College, where he was in charge of physics, zoology, and geology. In 1872 he returned to Rensselaer Polytechnic, serving in 1872-'73 as instructor, and then as Assistant Professor of Physics. His ability soon attracted the attention of his scientific colleagues, and in 1875 he was called to the chair of Physics in Johns Hopkins University. He spent a year in Europe purchasing apparatus for the laboratory, and was for some months

a student under Helmholtz in Berlin, where he demonstrated that a moving charge of statical electricity has the same magnetic effect as a current. On his return in 1876 he entered upon the duties of his chair in Baltimore, remaining there until his death. The mechanical equivalent of heat, requiring more careful thermometric and calorimetric methods than had ever been used, was the first important investigation that he took up in Baltimore. This led to a study of the measurement of electrical quantities, and he made a careful determination of the ohm, which work he subsequently extended under the auspices of the Na-

tional Government. His name is associated with the diffraction gratings prepared by him. Recognizing the necessity for more perfect appliances in this field, he constructed a dividing-engine for ruling gratings, the essential parts of which were a screw of nearly perfect uniformity of pitch and a most ingenious device for the correction of periodic errors. Greater advantages being possible with concave gratings, he extended his method to their production, and his plane and concave gratings are now in use in all the physical laboratories of the world. With these he made a study of the solar spectrum, and in order to supplement eye observations he studied photographic methods and prepared his own plates. He mapped the solar spectrum from the extreme red to the ultra-violet, and prepared enlarged maps, which he published. Following this, he began the systematic study of the arc spectra of all the elements, a work which he had not finished at the time of his death. He also devoted much attention to the theory of alternating currents, and their application for practical purposes. He devised a system of multiplex telegraphy depending upon synchronous motors, which gained for him a grand medal at the Paris Exposition in 1900. Prof. Rowland's knowledge of electricity was frequently taken advantage of, and the general treatment of the employment of the force at Niagara Falls for the generation of electricity was developed by him. When the Keely motor was submitted to a board of scientific experts by the originator, Rowland alone exposed its true nature as subsequently shown. His remarkable skill as an amateur photographer was testified to by numerous prizes awarded to him at international exhibitions. In 1881 he was made a member of the Electrical Commission in Paris, and later he was appointed a permanent member of the International Commission for establishing electrical units. He was made a chevalier of the Legion of Honor in 1881, and in 1896 was advanced to the grade of officer. The Rumford medals of the American Academy were awarded him in 1884, and the Matteucci medal in 1897, in addition to which he received medals of award at the world's fairs in Chicago and Paris for his scientific inventions. The degree of Ph.D. was conferred upon him by Johns Hopkins University in 1880, and that of LL.D. by Yale in 1895 and by Princeton in 1896. In 1883 he presided over the section of physics of the American Association for the Advancement of Science, delivering a valuable opening address entitled *A Plea for Pure Science*, and in 1881 he was elected to the National Academy of Sciences. His researches were given to the world in monographs and papers contributed to scientific journals and to the proceedings of societies, and number more than 100.

Ruggles, James M., lawyer, born in Richland County, Ohio, March 7, 1818; died in Havana, Ill., Feb. 9, 1901. He is said to have drafted the platform on which the Republican party was organized in Illinois, being one of a committee, with Abraham Lincoln and Ebenezer Peck, appointed for that purpose at the session of the Illinois Legislature in February, 1856. As the other members of the committee were otherwise engaged, the chief work devolved on Gen. Ruggles. At the outbreak of the civil war he was appointed by Gov. Yates a lieutenant in the 1st Illinois Cavalry. When mustered out in 1864 he was lieutenant-colonel of the 3d Illinois Cavalry, and for a time had commanded the regiment. At the close of the war he was brevetted brigadier-general. He was the author of the first drainage law in Illinois.

Sadtler, Benjamin, educator, born in Baltimore, Md., Dec. 25, 1823; died in Atlantic City, N. J., April 28, 1901. He received his education in the institutions at Gettysburg, Pa., and was licensed to preach by the Lutheran synod of Maryland in 1844. He served as pastor at Pinegrove, Shippensburg, Middletown, and Easton, in Pennsylvania. From 1862 to 1875 he was principal of the college for women at Lutheran, Md., and from 1876 to 1885 he was president of Muhlenberg College. He was specially noted as an English scholar and writer. He was disabled by an accident, retired from regular active service in 1885, and removed to his former home at Baltimore, but was still busily engaged in various spheres and as a writer for numerous periodicals of the Church.

Safford, Truman Henry, mathematician, born in Royalton, Vt., Jan. 6, 1836; died in Newark, N. J., June 13, 1901. At an early age he attracted attention by his powers of calculation. When six years old he could mentally extract the square and cube roots of numbers of 9 and 10 places of figures, and could multiply 4 figures by 4 figures as rapidly as it could be done on paper. In 1845 he prepared an almanac, and at the age of fourteen calculated the elliptic elements of the first comet of 1849. He abridged by one-fourth the labor of calculating the rising and setting of the moon, and after long and difficult problems had been read to him once he could give their results without effort. He was graduated at Harvard University in 1854, and was appointed to a place in the observatory there, which he held ten years. He then became director of Dearborn Observatory of the old Chicago University, serving till 1874, when he became connected with the United States Coast Survey. He directed the survey of the boundaries of New Mexico and Utah. In 1876 he was appointed Professor of Astronomy in Williams College, which chair he held at his death. He published a *Continual Star Catalogue* for Williams College and two north-polar star catalogues for Harvard Observatory.

Salisbury, Edward Elbridge, philologist, born in Boston, Mass., April 6, 1814; died in New Haven, Conn., Feb. 5, 1901. He was graduated at Yale College in 1832, and studied theology there. From 1836 to 1839 he studied Oriental languages in Paris and Berlin. In 1841 he was made Professor of Arabic and Sanskrit in Yale, holding the chair of Sanskrit till 1854 and that of Arabic till 1856. About this time he was elected corresponding secretary of the American Oriental Society, and he conducted its journal for several years. He became president of the society in 1863. He received the degree of LL.D. from Yale in 1869, and from Harvard in 1886. He was the author of several volumes of Genealogical and Biographical Monographs.

Samford, William James, Governor of Alabama, born near Gainesville, Ga., Sept. 16, 1844; died in Tuscaloosa, Ala., June 12, 1901. His boyhood was spent on a farm and in a printing-office. In 1861 he enlisted in the Confederate army, and was promoted to lieutenant. After the war he read law, paying especial attention to constitutional law. He was a presidential elector in 1872, and again in 1876. In 1875 he was a member of the Alabama Constitutional Convention. In 1878 he was elected to Congress. Later he served two terms in the Senate of Alabama, and during the second term he was president of that body. In 1900 he was elected Governor of Alabama, receiving 115,187 votes, against 28,288 for his Republican opponent.

Sampson, Thomas, detective, born in Appleby, England, in 1827; died in Mount Vernon, N. Y., April 19, 1901. With his parents he came to the United States in 1830. In 1851 he became a patrolman on the New York police force and was assigned to the Eighteenth Precinct, where he caught a number of noted murderers and attracted attention by his numerous rescues from drowning and from burning buildings. In 1860 he resigned from the police force and was employed by the New York Bankers' Association to take care of the interests of the men doing business in Wall Street. While holding this place he captured Edward Gray, a clever forger, and on three occasions went to Australia to bring back men who had stolen from bankers. Later he went into the service of the United States Government. He was one of the detectives assigned to the care of President-elect Lincoln during his inauguration. After the assassination of President Lincoln he was detailed to run down the conspirators. In the eighties he was a familiar figure in Wall Street, where he was detailed by the Government to duty at the Subtreasury; of late years his duty consisted in watching for thieves there. He had received at various times 16 medals from the Government and societies.

Schott, Charles Anthony, scientist, born in Mannheim, Germany, Aug. 7, 1826; died in Washington, D. C., July 31, 1901. He was graduated at the Polytechnic School in Karlsruhe in 1847,

with the degree of C. E. A year later he came to the United States and entered the service of the Coast Survey, in which he continued until his death, serving at first in the computing division, then as hydrographic draftsman, after which, in July, 1850, he returned to the computing division, becoming computer in 1852, receiving charge of the division in 1855, and was

made assistant in 1856 (the highest grade in the survey after the superintendent), in which capacity he remained until Dec. 31, 1899, when he was assigned to the discussion of the arc measurements in the United States resulting from the extensive triangulation executed by the organizations engaged in survey work. As early as 1855 he was in charge of the magnetic work of the survey, and in 1863 he was engaged in surveying the defenses of Washington. In 1869 he took a party to Illinois to observe the total eclipse of the sun, and in 1870 went to Catania, Sicily, to observe an eclipse. He represented the Coast Survey in 1898 at the International Conference on Terrestrial Magnetism, in Bristol, England, and later in the same year he was awarded by the French Academy of Sciences the Wilde prize on account of his researches and publications in the field of terrestrial magnetism. Mr. Schott was one of the founders of the Philosophical Society of Washington in 1871, and of the Washington Academy of Sciences in 1898. He was chosen a member of the National Academy of Sciences in 1872.

Besides his memoirs on the determination of the magnetic elements at the permanent observatories of the United States, and at a great number of temporary stations, and other papers contributed to the annual reports of the Coast Survey, he published, through the medium of the Smithsonian Institution, *Magnetical Observations in the Arctic Seas*, reduced and discussed from material collected by Elisha K. Kane (1858); *Meteorological Observations in the Arctic Seas*, likewise collected by Elisha K. Kane during the second Grinnell expedition (1859); *Astronomical Observations in the Arctic Seas*, from data collected by Elisha K. Kane (1860); *Tidal Observations in the Arctic Seas* (1860); *Meteorological Observations in the Arctic Seas*, from results made on board the arctic searching yacht Fox in Baffin Bay and Prince Regents Inlet in 1857-'59 (1862); *Physical Observations in the Arctic Seas*, from data collected by Isaac I. Hayes (1867); *Results of Meteorological Observations made at Brunswick, Me., between 1807 and 1859* (1867); *Results of Meteorological Observations made at Marietta, Ohio, between 1826 and 1859 Inclusive* (1868); *Tables and Results of the Precipitation in Rain and Snow in the United States, and at Some Stations in Adjacent Parts of North America, and in Central and South America* (1872; 2d ed., 1881); *Tables, Distribution, and Variations of the Atmospheric Temperature in the United States and Some Adjacent Parts of America* (1876); and *Magnetic Charts of the United States*, showing the distribution of the declination, the dip, and the intensity of the magnetic force (1882 and 1885). His last works were *The Transcontinental Triangulation and American Arc of the Parallel* (1900) and *The Eastern Oblique Arc of the United States* (1902).

Scott, Julian, artist, born in Johnson, Vt., Feb. 15, 1846; died in Plainfield, N. J., July 4, 1901. He studied at Norwich Academy, and at the outbreak of the civil war enlisted as a drummer-boy with the 3d Vermont Regiment. He served two years and a half and received a medal of honor for wading across a stream and rescuing wounded National soldiers while he was on the staff of Gen. William F. Smith. During his term of service he made many sketches that he afterward developed in his paintings. In 1863 he began his art studies at the National Academy of Design in New York city, and later studied in Paris under Emanuel Leutze. After his return to the United States, in 1868, he for a few years had a studio in New York, and in 1875 removed to Plainfield, N. J. In 1890 he was appointed a special commissioner to report upon the Indians of Oklahoma, Arizona, and New Mexico. His report was published in connection with the report upon the Indian population of the eleventh census, and included 40 of his sketches as illustrations. He spent three years in this work, and collected many valuable Indian relics. The Indians became very much attached to him, and made him a member of one of their societies. After 1870 he was an associate of the National Academy. He was widely known as a battle and figure painter. His *Battle of Antietam* was purchased by the late Elliott F. Shepard and presented to the 7th Regiment of New York; The Rear-Guard at White Oak Swamp hangs in the State-House at Montpelier, Vt.; and *The Death of Gen. Sedgwick* in the Plainfield Art Gallery. Other well-known pictures are *The Battle of Cedar Creek*; *Battle of Golding's Farm*; *The Recall*; *On Board the Hartford*; *Old Records*; *Duel of Burr and Hamilton*; *Reserves Awaiting Orders*; *Charge at Petersburg*; *The War is Over*;

and The Blue and the Gray. Several of his paintings are in the Boston Museum of Art; among others, The Song of the Ancient People, in 11 water-color paintings.

Sedgwick, Deborah Gannett, born in Cambridge, Mass., June 2, 1825; died in Syracuse, N. Y., Jan. 22, 1901. She was the daughter of the Rev. Thomas Brattle Gannett, a Unitarian clergyman, and at the age of sixteen she went to Brook Farm, where she remained two years. She then went to Syracuse to teach, and there married, June 22, 1847, Charles Baldwin Sedgwick, a prosperous lawyer of that city. Mrs. Sedgwick enjoyed the personal friendship of Hawthorne, Emerson, John S. Dwight, George William Curtis, Ellen Slade, Louisa M. Alcott, Charles A. Dana, Margaret Fuller, Theodore Parker, and Wendell Phillips, and she corresponded with most of them long after Brook Farm was discontinued. She published an interesting reminiscence of the life of the community in the *Atlantic Monthly* for March, 1900.

Sewell, William Joyce, Senator, born in Castletbar, Ireland, Dec. 6, 1835; died in Camden, N. J., Dec. 27, 1901. He came to the United States when eleven years old, and for a time was a sailor before the mast. Later he was employed in banking with his brother, and was in charge of a branch office in Minnesota. This bank failed, and he returned to New York, where for a time he was employed in a dry-goods house. At the outbreak of the civil war he was commissioned a captain in the 5th New Jersey Volunteers, Aug. 28, 1861. He participated in all the engagements in which his regiment took part to the battle of Spottsylvania, and was wounded at Chancellorsville and Gettysburg. He was promoted lieutenant-colonel in July, and colonel in October, 1862. In September, 1864, he became colonel of the 38th New Jersey Volunteers, with which he served till the close of the war. He was brevetted brigadier-general and major-general. After the war he became connected with the railroads in New Jersey, branches of the Pennsylvania Railroad system. He was elected State Senator in 1872, reelected in 1875, and again in 1878, and was president of that body in 1876, 1879, and 1880. In 1881 he was elected to the United States Senate, and he was again elected to that body in 1895. In 1877 he was made brigadier-general of the New Jersey National Guard, and in 1899 was appointed its major-general.

Shanks, John Peter Clever, lawyer, born in Martinsburg, W. Va., June 17, 1826; died in Portland, Ind., Jan. 23, 1901. He studied law in Indiana and began his practise there in 1850. In 1853 and 1854 he was a member of the Indiana Legislature. In 1860 he was elected to Congress. In 1861, after the battle of Bull Run, he entered the National army, and later served in Missouri as a member of Gen. Frémont's staff. He was again elected to Congress, serving from the Fortieth to the Forty-third. In Congress he was chairman of the Committee on Union Prisoners. Later he was appointed an Indian agent.

Shaw, Albert Duane, soldier, born in Lyme, N. Y., Dec. 27, 1841; died in Washington, D. C., Feb. 10, 1901. He was educated at Belleville Union Academy and Canton University. When the civil war broke out he enlisted in the 35th New York Volunteers. With this regiment he took part in the battles of Rappahannock Station, Bull Run, Chantilly, South Mountain, Antietam, and Fredericksburg. During the latter part of the war he was special agent of the War Department in the office of the provost-marshal at Watertown, N. Y. He was graduated at Law-

rence University in 1867, and in 1868 was a member of the New York Assembly. While serving in this capacity he was also appointed colonel of the 36th Regiment, National Guard. He resigned late in the same year to become United States consul at Toronto, Canada, where he remained ten years. In 1878 he was promoted to the consularship of Manchester, England, from which post he was removed in 1885 by President Cleveland. In 1900 he was elected to Congress.

Shaw, Thomas, inventor, born in Philadelphia, Pa., April 5, 1838; died there, Jan. 19, 1901. In 1858 he secured his first patent, and after that date perfected many contrivances, among them an apparatus for automatically testing gases in mines, improvements in the power-hammer and steel gage, a mercury steam-gage, a noiseless steam-exhaust, and a pump valuable for its ability to pump mud and sand. He was the first man in America to roll steel tires. In 1880 he built the wharf at the League Island Navy-Yard, employing one of his inventions, the gunpowder pile-driver.

Shepherd, Russell Benjamin, manufacturer, born in Fairfield, Me., Sept. 14, 1829; died in Skowhegan, Me., Jan. 1, 1901. He was graduated at Colby University in 1857. At the outbreak of the civil war he enlisted in the 18th Maine Volunteers; he was made adjutant, and later promoted colonel and brevet brigadier-general. He was president of the Skowhegan Pulp Company.

Sidman, Arthur, actor, born in Homer, N. Y., Aug. 3, 1863; died at Higgins Beach, Me., Aug. 12, 1901. He learned the printer's trade in the office of the *Homer Republican*; afterward he worked as a reporter on the paper, and was finally associated with the late Frank R. Slayton in editing the *Tully, N. Y., Times*. In Tully Mr. Sidman organized an amateur dramatic club that met with such success in its initial performance, Foiled, that he took the piece around a circuit of the neighboring towns, and finally he abandoned newspaper work to go about the State organizing amateur performances. In 1887 he began starring in his own play, Uncle Reub. In 1891 he married Ella M. Brooks, of Hornellsville, who afterward appeared with him. Squire Haskins and A Summer Shower were added to their repertoire. In 1892 Mr. and Mrs. Sidman entered vaudeville in Mr. Sidman's very humorous character sketch, A Bit of True Life, in which they continued successfully till Jan. 5, 1899, when at Wilmington, Del., they produced Mr. Sidman's Back Home. His impersonation of the shrewd, keen, big-hearted rustic placed him among the foremost of American character actors. He appeared as Myron Cooper, the old organ-builder, in a successful trial tour of his drama York State Folks, in the spring of 1901.

Sill, John Mahelm Berry, educator, born in Black Rock, N. Y., Nov. 23, 1831; died in Detroit, Mich., April 6, 1901. In 1854 he was graduated at the Michigan Normal School at Ypsilanti, and was immediately appointed Professor of English in that institution; for several years he was principal of the school. Later he was superintendent of the public schools of Detroit. In 1890 he was ordained a minister of the Protestant Episcopal Church. In 1893 he was appointed minister resident and consul-general for the United States in Korea. He was the author of *Synthesis of the English Sentence* (1856) and *Lessons in English* (1879). He received the degree of A. M. from the University of Michigan in 1871, and Master of Pedagogics from the Michigan State Normal College in 1892.

Simms, William Thomas, soldier, born in New York city, June 26, 1844; died there, Jan. 28, 1901. He was graduated at Columbia College Law School. In April, 1861, he enlisted in the 2d Regiment, New York State Militia, which went to the front as the 82d Regiment, New York Volunteers. He took part in many battles, and at Gettysburg was wounded four times. May 6, 1864, while serving as an aide on the staff of Gen. Alexander S. Webb, he received a severe wound in the head, which caused partial paralysis. In the autumn of 1864 he again joined his regiment, and was commissioned lieutenant and later captain. At the close of the war he was major of the 59th Regiment, New York Volunteers, with brevet rank of lieutenant-colonel.

Smith, Beaumont, actor, born in St. Louis, Mo., in 1860; died in Denver, Col., Aug. 14, 1901. He was a friend of Guy Lindsley and Edward S. Ables, and with them formed an amateur company. After considerable success they all entered the profession, Smith making his debut with Booth and Barrett in 1885. He appeared with them for several seasons, and then became associated with Mme. Modjeska and devoted himself chiefly to Shakespearean comedy characters. He was accounted a most excellent Touchstone, and his Lucio, in *Measure for Measure*, was highly commended. He also at intervals sang successfully in comic opera. In March, 1900, Mr. Smith appeared as Mr. Boswell in Stuart Robson's production of *Oliver Goldsmith* at the Fifth Avenue Theater, New York. In 1901 he became stage-director of the Woodward Stock Company, of Kansas City.

Sneed, John Louis Taylor, jurist, born in Raleigh, N. C., May 20, 1820; died in Memphis, Tenn., July 29, 1901. He was educated at Oxford Academy, in North Carolina, studied law in West Tennessee, and in 1843 settled in Memphis. In 1845 he was elected to the Tennessee Legislature. In 1846-'47 he was a captain in the Mexican War. In 1851 he was elected attorney-general of the Memphis judicial district, resigning three years later to become a candidate for Attorney-General of the State; he was elected and served till 1859. In 1861 he enlisted in the Confederate army, and later was commissioned brigadier-general of the provisional army of Tennessee. In 1870 he was elected a judge of the Supreme Court of Tennessee, which office he held eight years. In 1879 he served on the court of arbitration, and was judge of the State Court of Referees in 1883-'84. From 1887 till 1893 he was president of the Memphis Law School. He was the author of *Reports of the Supreme Court of Tennessee, 1854-'59*.

Snively, William Andrew, clergyman, born in Greencastle, Pa., Dec. 6, 1833; died in Louisville, Ky., March 2, 1901. He was graduated at Dickinson College in 1852, was ordained in the Methodist Church, and served it till 1865, when he entered the Episcopal ministry. He held rectorships in Cincinnati, Albany, Brooklyn, and New Orleans, but in 1892 gave up the ministry on account of failing health. He received the degree of S. T. D. from Columbia University in 1875. He was the author of *The Oberammergau Passion Play* (1881); *Esthetics in Worship* (1887); *Parish Lectures on the Prayer-Book* (1887); *Testimonials to the Supernatural* (1888); *Family Prayer for the Christian Year* (1888); *Genealogical Memoranda*; and *The Cathedral System in the American Church*.

Snook, John Butler, architect, born in London, England, July 16, 1815; died in Brooklyn, N. Y., Nov. 1, 1901. He came to New York city when a child and was educated in the private

schools. He became a master builder, but in 1842 turned his attention to architecture. He was in partnership with Joseph French eight years, in business alone till 1887, and then associated his sons with himself. He designed and erected, among other buildings, Niblo's Garden, the Metropolitan Hotel, the Hoffman House, All Angels' Church, and the Vanderbilt mansions in Manhattan, and the Hebrew Orphan Asylum and Packer Institute in Brooklyn.

Snow, Lorenzo, fifth president of the Mormon Church, born in Mantua, Ohio, April 3, 1814; died in Salt Lake City, Utah, Oct. 10, 1901. After studying in the schools of Ravenna, Ohio, and for a time at Oberlin. On a visit to Kirtland, Ohio, he met Joseph Smith and his fellow Mormons and was converted to their faith. In 1837 he was baptized and ordained an elder, and at once became one of their most aggressive and successful missionaries. In 1840 he was sent to England to aid Parley P. Pratt, president of the British mission. On his return to the United States he organized the Nauvoo Legion of Mormon troops, and he was also in charge of the Nauvoo School. He conducted the campaign planned to make Joseph Smith President of the United States in 1844, and though he took an active part in seeking the final home of the Mormons, he was prevented by illness from reaching Salt Lake till 1848. He was made one of the Twelve Apostles Feb. 12, 1849, and from that time was one of the most active and influential of the Mormon leaders. From 1852 till 1882 he served continuously in the Utah Legislature. He also took an active interest in educational affairs, and was at one time at the head of the High School in Salt Lake City. In 1849 he made a mission tour in Italy, another to the Hawaiian Islands in 1864, and in 1872 he made a tour of Europe and Palestine. In 1855 he founded Brigham City, Utah, where he established a successful cooperative system, beginning with a store, and afterward adding a tannery, a woolen factory, and several farms. He was made president of the Twelve Apostles in April, 1889, and president of the Temple, when it was opened in May, 1893. At a special meeting of the Council of Apostles, Sept. 13, 1898, he was elected president of the Church of Latter-Day Saints, to succeed Wilford Woodruff. He was the author of *The Italian Mission* (1851); *The Only Way to be Saved* (1851); *The Voice of Joseph* (1852); and *The Palestine Tourists* (an account of his journey in Europe and the Holy Land in 1872). He translated the Book of Mormon into Italian.

Starr, Eliza Allen, author, born in Deerfield, Mass., Aug. 29, 1824; died in Durand, Ill., Sept. 9, 1901. She became a Roman Catholic in 1850, and removed to Chicago a few years later. She was long prominent in Roman Catholic circles, and lectured much upon religious art. Several of her writings met with favor at Rome, and a medallion was sent to her by Pope Leo in appreciation. Her nature was exceptionally gentle and attractive, and greatly endeared her to a wide circle of friends. Her published works comprise *Patron Saints* (1871); *Pilgrims and Shrines* (1883); *Songs of a Lifetime* (1887); *A Long Delayed Tribute to Isabella of Castile as Discoverer of America* (1890); *Christmastide; Christian Art in our Own Age; What we See; Three Keys to the Camera Della Segnatura* (1895); *The Seven Dolours of the Blessed Virgin Mary* (1898); and *The Three Archangels and the Guardian Angels in Art* (1899).

Sterne, Simon, lawyer, born in Philadelphia, Pa., July 23, 1839; died in New York city, Sept. 22, 1901. He was graduated at the law depart-

ment of the University of Pennsylvania in 1859, was admitted to the bar in 1860, and removed to New York city, where he began to practise in 1861. He became the counsel for many large corporations and mercantile houses. Early in his career he paid especial attention to the study of political economy, and in 1863 and 1865 delivered lectures on that subject in Cooper Union. In 1864 he was one of the organizers of the American Free-Trade League, and became its secretary. In 1865 he published the *Social Science Review*. He was secretary of the Committee of Seventy in the fight against the Tweed régime, and drafted the charter of this committee and other legislation of the period. In 1875 he was appointed one of the commissioners to devise a plan for the government of cities in New York State. In 1895 he was one of the commission to recommend changes in the methods of administration. In 1896 he went to Europe to report on the relations between the railroad and governments of western Europe. He contributed many articles to magazines on economic and political subjects, and published *Our Representative Government* and *Personal Representation* (1871); *Suffrage in Cities* (1878); *Hindrances to Prosperity* (1879); and *Constitutional History and Political Development of the United States* (1882).

Sterrett, James P., jurist, born in Juniata County, Pennsylvania, Nov. 7, 1822; died in Philadelphia, Pa., Jan. 22, 1901. He was graduated at Jefferson College in 1845, and at the University of Virginia in 1848. He practised law in Pittsburg till 1861, when he was appointed a commissioner to revise the revenue laws of Pennsylvania. In 1862 he was appointed to fill the vacancy caused by the death of the president judge of Allegheny County; later in the year he was elected, as a Republican, to the same office, being reelected in 1872 by the votes of both parties. In 1877 he was appointed justice of the Supreme Court, and Feb. 21, 1893, was made chief justice. He resigned Jan. 1, 1900.

Stockley, Charles Clark, ex-Governor of Delaware, born in Sussex County, Delaware, Nov. 6, 1819; died in Georgetown, Del., April 20, 1901. In early life he was successively teacher, merchant, and farmer. In 1854 he was elected sheriff of Sussex County on the Democratic ticket. In 1872 he was elected State Senator, serving two terms, and in 1875, during his second term, was president of the Senate. In 1882 he was chosen Governor of Delaware. In 1896 he left the Democratic party on the money question and championed the cause of the gold Democrats.

Stoddard, Lorimer, actor and playwright, born in New York city in 1864; died in Sag Harbor, N. Y., Aug. 31, 1901. He was the only son of Richard Henry and Elizabeth Barstow Stoddard. In order to prepare himself for dramatic writing he became an actor, appearing first in minor parts with the Lyceum Theater company. His first pronounced success was at the Union Square Theater in 1887, when he played Trelawney, the young English nobleman, in the original production of *The Henrietta*, supporting Robson and Crane. He continued to act at intervals up to 1897, but his acting was always to him a matter of secondary importance. He appeared in New York city as Henry Achurch in the special performance of *The Globe-Trotter*, at the Garden Theater, in July, 1894; as Monte Jones in *The Governor of Kentucky*, supporting W. H. Crane, at the Fifth Avenue Theater, in January, 1896; and as Adolph Kleinbacher in the melodrama *New York*, at the American Theater, in February, 1897. He was for a time a member of Richard

Mansfield's company, and for Mr. Mansfield he wrote his first play, *Napoleon*, which was successfully produced at the Garrick Theater in December, 1895. A year later he dramatized Thomas Hardy's *Tess* of the D'Urbervilles, which was produced with great success by Mrs. Fiske at the Fifth Avenue Theater in March, 1897. In June of the same year his play, *The Question*, was presented by Daniel Frawley's company in San Francisco. His last work, with the exception of a play upon which he was at work at his death, was the dramatization of Marion Crawford's *In the Palace of the King*, in which Viola Allen made a notable success in the season of 1900-1901. He was also the author of several one-act plays. Personally Mr. Stoddard was a genial and attractive man, and from a literary as well as a dramatic point of view his work was of a high order.

Strecker, Herman, sculptor and naturalist, born in Philadelphia, Pa., March 24, 1836; died in Reading, Pa., Nov. 30, 1901. With his parents he removed to Reading in 1845. His first work as a sculptor was done when he was but twelve years old; one of his best-known works of art was the *Soldiers' Monument* at Reading. He devoted his leisure to the study of zoology, mineralogy, and especially butterflies, of which he had a collection of more than 300,000. He published *Lepidoptera*, *Rhopaloceres*, and *Heteroceres*, *Indigenous and Exotic* (1872-'77), and *Native and Exotic Butterflies and Moths* (1878).

Streeter, Alson J., politician, born in Rensselaer County, New York, in 1823; died in Galesburg, Ill., Nov. 24, 1901. He removed early to Illinois, where he became a farmer, and where throughout his life he interested himself in bettering the condition of the agricultural and laboring classes. He was the candidate of the National Labor party for President of the United States in 1888, and three years later for United States Senator, and conducted both campaigns with great earnestness in the face of sure defeat.

Studebaker, Clement, manufacturer, born in Gettysburg, Pa., March 12, 1831; died in South Bend, Ind., Nov. 27, 1901. With his parents he removed to Ashland County, Ohio, in 1836, and learned the blacksmith trade. In 1850 he went to South Bend, where he taught school during the winter of 1850-'51. In February, 1852, he started in the blacksmith business with his brother Henry, and among the first work turned out by them was a contract for 100 wagons for the Government. In 1868 their company was incorporated as the Studebaker Brothers Manufacturing Company; he was its president. He was a delegate at various times to National Republican conventions, commissioner for Indiana to the Paris Exposition of 1878, also to the New Orleans Exposition, president of the Indiana Board of World's Fair Managers, member of the Pan-American Congress, and a trustee of Depauw University.

Sudsbury, Joseph Maria, soldier, born in Munich, Germany, March 17, 1827; died in Baltimore, Md., April 8, 1901. He entered the Bavarian army, and after several years' service was appointed 2d lieutenant in the Royal Artillery. In 1848 he took part in the struggle of the people against the King, and after the defeat that came to his party he went to Switzerland. Later he went to France, where he served as a private in the Legion of Strangers under Marshal McMahon. He came to the United States, and in April, 1861, enlisted as a private in the 2d Maryland Regiment, National army. He was elected captain of his company, and later recruited the

1st German Rifles, which were consolidated with the 3d Maryland Regiment, and with them took part in many battles in the valley of Virginia. He was successively appointed colonel and brevet brigadier-general.

Sunderland, Byron, clergyman, born in Shoreham, Vt., Nov. 22, 1819; died in Catskill, N. Y., June 30, 1901. He was graduated at Middlebury College in 1838, and at Union Theological Seminary, New York city, in 1843. His first charge was the Presbyterian Church at Batavia, N. Y., where he remained from 1845 till 1851. For a time he was at the Park Presbyterian Church, Syracuse, N. Y., as pastor-elect, but before his installation he was called, in February, 1853, to the First Presbyterian Church, Washington, D. C. His service there was almost continuous till his death. In 1864-'65, on account of impaired health, he went to Paris, and there had charge of the American chapel. In 1898 he was retired as pastor emeritus, but in March, 1899, he was again made active pastor. During the civil war and again from 1873 till 1879, he was chaplain of the United States Senate. He received the degree of D. D. from Middlebury College in 1855.

Sweet, Alexander Edwin, humorist, born in St. John, New Brunswick, March 28, 1841; died in New York city, May 20, 1901. When he was nine years of age his parents settled in Texas. He was sent to Karlsruhe, Germany, where he was graduated at the Polytechnic School in 1861. Returning to Texas, he served in the civil war as a private in the 37th Texas Cavalry. After the war he studied law, and was admitted to the bar in 1868. He practised several years, at the same time engaging in newspaper work. In 1875 he became city editor of the Galveston News. His humorous sketches attracted attention, and in 1881 he started in Austin Texas Siftings, of which he was editor and half-owner. In 1883 this paper was removed to New York city. Mr. Sweet was connected with its publication till 1895. Among the humorous characters he created was Colonel Bill Snort, confidential adviser to the President. His published books include *Three Dozen Good Stories* (1887) and *On a Mustang through Texas* (1888).

Swinton, John, journalist, born near Edinburgh, Scotland, Dec. 12, 1829; died in Brooklyn, N. Y., Dec. 15, 1901. He removed with his parents to the United States in 1843, and, after spending some time in the West as a journeyman printer, went to New York city in the early fifties. As a preparation for newspaper work he took up the study of law and medicine, at the same time writing for the press. In 1860 he became connected with the New York Times as editorial writer, remaining with that paper till 1870. From 1875 till 1883, and again from 1893 till 1897, he was an editorial writer on the New York Sun. From 1874 he was busy as an orator and writer, championing the cause of the poor and oppressed, and in the autumn of that year he was nominated for mayor of New York by the Industrial Political party. From 1883 till 1887 he published weekly *John Swinton's Paper*, by means of which he spread his ideas on social and industrial questions. In the municipal campaign of 1887 he was a candidate of the Progressive Labor party for State Senator. Besides his newspaper work, he published *The New Issue* (1870); *Eulogy of Henry J. Raymond* (1870); *John Swinton's Travels* (1880); *Oration on John Brown* (1881); and *Striking for Life* (1894).

Tanner, John Riley, ex-Governor of Illinois, born near Booneville, Ind., April 4, 1844; died in Springfield, Ill., May 23, 1901. He was educated

in the district schools. He enlisted in the 98th Illinois Infantry, was transferred to the 61st Illinois Infantry, and was mustered out of the service in November, 1865. After the war he settled in Clay County and became a farmer. In 1870 he was elected sheriff, and in 1872 circuit-court clerk. In 1877 he was appointed master in chancery of the circuit court. In 1880 he was elected to the State Senate. In 1883 he was appointed United States marshal of the Southern District of Illinois, but he was removed by President Cleveland. In 1886 he was elected State Treasurer, and in 1890 was appointed railway commissioner. In May, 1892, he was made assistant treasurer of the United States Treasury at Chicago. In 1894 he was elected chairman of the Republican State Central Committee. In 1896 he was the Republican candidate for Governor, and was elected by a large majority over John P. Altgeld.

Taylor, James Edward, artist, born in Cincinnati, Ohio, Dec. 12, 1839; died in New York city, June 22, 1901. He was educated at the University of Notre Dame, South Bend, Ind. He showed remarkable skill with pencil and brush at an early age, and just after his graduation he painted a panorama of the American Revolution. In 1860 he went to New York city to study art, but he enlisted in the 10th New York Regiment. During his leisure time he prepared many sketches of camp life and incidents. After two years' service as a private he was engaged by Frank Leslie as war correspondent and artist. At the close of the war he returned to act as special artist for the same publisher. In 1867 he was the detailed artist to the Peace Commission with the Indians, and the pictures he sent from the West at this time gained him the sobriquet of "the Indian artist." He severed his connection with Leslie's in 1883 and devoted his time thereafter to illustrating for magazines and painting water-colors. Among his paintings was *The Last Grand Review*, painted for Gen. Sherman. Four of his pictures are in the public library at Washington.

Temple, Robert, engineer, born in Spottsylvania County, Virginia, in September, 1831; died in Richmond, Va., Dec. 22, 1901. He began his career as a rodman on the New Orleans, Jackson and Great Northern Railway in 1852, and was afterward engaged in some of the most important railway construction in the South. He was principal assistant in the building of the great bridges over the Missouri river at St. Charles and Kansas City, and over the Ohio at Cincinnati. During the civil war he was connected with the engineering department of the Confederate army, and was stationed in Texas. In 1879 and 1880 Major Temple was general superintendent of the Greenville and Columbia Railroad; in 1880-'81, chief engineer of the Richmond and Allegheny Railway; from 1881 to 1886, chief engineer of the Georgia Pacific Railway; in 1887 and 1888, chief engineer of the Memphis, Birmingham and Atlantic, and of the Tennessee Midland Railway; and later was employed as chief engineer in the construction of the Georgia, Carolina and Northern Railway, the Atlanta extension of the Seaboard Air-Line.

Thayer, Joseph Henry, educator and author, born in Boston, Mass., Nov. 7, 1828; died in Cambridge, Mass., Nov. 26, 1901. He was graduated at Harvard in 1850, spent four years in teaching and traveling, and then studied theology at Andover, where he was graduated in 1857. He occupied the pulpit of the Evangelical Congregational Church in Quincy, Mass., one year, and in December, 1859, became pastor of Crombie Street

Church in Salem. From September, 1862, to June, 1863, he was in the field as chaplain of the 40th Massachusetts Infantry. In February, 1864, he resigned his pastorate and became Professor of Sacred Literature in Andover Theological Seminary. He held this chair eighteen years, and then

removed to Cambridge, where in 1884 he was chosen Bussey Professor of New Testament Criticism in Harvard Divinity School. He held that professorship continuously till 1901, when he was made professor emeritus. Meanwhile he was a member of the Harvard Corporation from 1877 to 1884, and from the autumn of 1872 to the autumn of 1880 he was a member of the American

Committee of Revision of the New Testament, and acted as its secretary. The committee held monthly meetings in New York during the eight years of its existence. Prof. Thayer was one of the last survivors of its seventeen members, and was very active in the preparation of the American Standard Edition of the Revised New Testament, which was brought out in August, 1901. His original publications were these: A biographical sketch of Ezra Abbot (1884); a Greek-English Lexicon of the New Testament (1886); The Change of Attitude toward the Bible (1891); Books and their Use (1893); and contributions to Smith's Bible Dictionary, Hastings's Dictionary of the Bible, and the Journal of Biblical Literature, besides occasional sermons and reviews. He edited Abbot's Critical Essays (1888), and Sophocles's Greek Lexicon (1888); translated Winer's New Testament Grammar (1869) and Buttmann's New Testament Grammar (1873), and wrote the notes to Scrivener's Plain Introduction (1885). His Lexicon of the New Testament is spoken of by scholars as a monument of learning and labor. In 1864 he was made A. M. at Harvard; he received the degree of D. D. from Yale, Harvard, and Princeton, and in 1892 the degree of Litt. D. from Trinity College, Dublin, Ireland. He was a member of the American Academy of Arts and Sciences, the American Oriental Society, the American Philological Association, and the Society of Biblical Literature and Exegesis. Prof. Thayer was prominent in the work of establishing the new School for Archeological Study at Jerusalem, in which he, more perhaps than any one else, took the initiative, and to which he gave unremitting effort in the last year of his life.

Thoburn, Isabella, missionary, born near St. Clairsville, Ohio, March 29, 1840; died in Lucknow, India, Sept. 1, 1901. She was educated at Wheeling Female Seminary, studied drawing and painting in Cincinnati, and for a long time was a teacher. In November, 1869, she sailed for India as the first representative of the Women's Foreign Missionary Society. She settled in Lucknow, where her brother, Dr. James M. Thoburn, had been an active missionary ten years. From that time till her death this was the center of her work. She was for many years president of the College for Women and Girls in Lucknow.

Thomas, John Rochester, architect, born in Rochester, N. Y., June 18, 1848; died at Westminster Park, Thousand Islands, Aug. 27, 1901. He was educated in the public schools, and later pursued a university course but did not take a degree. His architectural training was received under Merwin Austin, whose office he entered when fifteen years old. He began to practise his profession in 1868. In 1874 he was commissioned by Gov. Dix as architect and sole commissioner for the erection of the Elmira State Reformatory. He went to New York city in 1882 to supervise the erection of the Baptist Church in West Fifty-Seventh Street. In addition to more than 150 churches, he designed the asylum at Willard, N. Y., the 8th Regiment Armory in New York city, the New Jersey State Reformatory at Rahway, and the eastern New York Reformatory at Ellenville. Among his notable achievements was the building of the two drill-rooms of the combined armories of the 71st Regiment and the 2d Battery, one above the other, free from all columns, and 150 by 200 feet in area. In 1896 his design for a new City Hall received the first prize among 133 designs. His latest commission was the planning of the new Hall of Records for New York city.

Thompson, George W., actor, born in New York city in 1836; died there, June 12, 1901. He made his first appearance on the stage of the old Chatham Theater, in New York, when fifteen years old, and played successively at the Broadway Theater, the Adelphi Theater, in Troy, N. Y., Barnum's Museum, and on a Western tour with a traveling company till 1856, when he became leading man at the Old Bowery, then under the management of Fox and Lingard. Here he played in support of Edwin Forrest, E. L. Davenport, John E. Owens, Edward Eddy, Lucille Western, and others, till the destruction of the theater by fire in 1866. For the next three seasons he was leading man in Pastor's company, and then for one year managed the Seavey Opera-House, Brooklyn. In 1868, Mr. Thompson with some of his friends organized the order of Jolly Corks, the name of which was afterward changed to the Elks. In the season of 1870-71 he made a starring tour on the Pacific coast, and for the three years following was engaged in managerial ventures in St. Louis and St. Joseph, Mo. In 1875 he starred jointly with Gus Phillips in his own play, Yacup, acting alternately Irish and German characters. He was next successively leading man at Fox's and the New National Theaters, in Philadelphia, and for the three seasons following 1878 played the leading part in The Gold King. He was next engaged to support Louis Aldrich in My Partner, and remained with him a long time, taking Mr. Aldrich's place in the star rôle during the latter's severe illness. He afterward played in Bartley Campbell's Siberia, and for nine seasons with Harry Williams in The Waifs of New York and The Bowery Girl, and in support of Frank Daniels and Katie Emmett. He was best known for his German and Irish comedy parts. After 1860 Mr. Thompson gave serious attention to collecting theatrical curios, dramatic literature, and play-bills, and accumulated a valuable collection, which after his retirement from the stage, in 1897, he put on exhibition and sale in his house in Brooklyn.

Thompson, Maurice, author, born in Fairfield, Ind., Sept. 9, 1844; died Feb. 15, 1901. His parents, who were from the South, removed to Kentucky and thence to the hill region of northern Georgia. The son was educated by private tutors, and early became interested in the study

of outdoor life. He served through the civil war in the Confederate army, and at its close returned to Indiana, where he engaged in civil engineering. Later he studied law and practised in Crawfordsville, Ind. He was elected to the Legislature in 1879, and in 1885 was appointed State geologist of Indiana and chief of the department of Natural History, and served till 1889. In addition to many magazine articles he is the author of *Hoozier Mosaics* (1875); *The Witchery of Archery* (1878); *A Tallahassee Girl* (1882); *His Second Campaign* (1882); *Songs of Fair Weather* (1883); *At Love's Extremes* (1885); *Byways and Bird Notes* (1885); *The Boys' Book of Sports* (1886); *A Banker of Bankersville* (1886); *Sylvan Secrets* (1887); *The Story of Louisiana* (1888); *A Fortnight of Folly* (1888); *Poems* (1892); *Ethics of Literary Art* (1893); *Stories of the Cherokee Hills*; *Toxophilus in Arcadia*; *The Ocala Boy*; *The King of Honey Island*; *Lincoln's Grave* (poem); and *Alice of Old Vincennes* (1901).

Tilghman, Benjamin Chew, soldier, born in Philadelphia in 1821; died there, July 3, 1901. He was a graduate of the University of Pennsylvania, and studied law, but never practised. At the beginning of the civil war he enlisted in the 26th Pennsylvania Volunteers. He was severely wounded in the battle of the Wilderness, and returned home. After his recovery he commanded a colored regiment. He was one of the founders of the Union League.

Todd, Robert Barr, jurist, born in Lexington, Ky., Jan. 17, 1826; died in Brooklyn, N. Y., Feb. 4, 1901. He was graduated at the University of Missouri in 1843. In 1846 he accompanied Doniphan in his military expedition to Mexico. In 1848 he settled in Bastrop, La., where he resided till a short time before his death. He served several terms in both houses of the Louisiana Legislature. In 1860 he was a member of the Constitutional Convention, and voted for the secession of his State. In 1880 he was appointed to the Supreme Court of Louisiana, and he held that office eight years.

Tojetti, Virgilio, artist, born in Rome, Italy, March 15, 1851; died in New York city, March 27, 1901. He studied in Paris under Gérôme for drawing and Bougereau for coloring, and came to the United States in 1870. He exhibited a scene from Bulwer-Lytton's *Richelieu* at the National Academy of Design about 1883, and it was sold for \$4,000, the highest price up to that date for a picture in the Academy. The Cornelius Vanderbilt house, the Savoy Hotel, the Hoffman House, in New York city, and Keith's theaters in Boston and Providence give examples of his decorative work. Among his easel paintings are *Galatea*, *The Two Roses*, *Burst of Melody*, *Sorrow*, *The Veiled Prophet of Khorassan*, *Out of the Gates of Paradise*, *Love's Temptation*, and *The Favorite*.

Townsend, Mary Ashley, author, born in Lyons, N. Y., in 1836; died in Galveston, Texas, June 7, 1901. Her maiden name was Van Voorhis. She was educated in the schools of her native town, and began to write for publication about 1856 under the pen name *Xariffa*. She first attracted general attention as the author of *Quillotypes*, a series of humorous papers that appeared in the *Delta*, a New Orleans paper, in which city she resided after her marriage to Gideon Townsend. She was appointed to deliver the poem on the opening of the New Orleans Exposition in 1884, and that at the unveiling of the statue of Gen. Albert Sidney Johnston in 1887. She published *The Brother Clerks* (1859); *Poems* (1870); *The Captain's Story* (1874); *Down the Bayou*, and *Other Poems* (1884); and *Distaff and Spindle*. Her most im-

portant short poems are *Creed*, *A Woman's Wish*, *The Bather*, and *The Wind*.

Trenholm, William Lee, banker, born in Charleston, S. C., Feb. 3, 1836; died in New York city, Jan. 11, 1901. He was graduated at the College of South Carolina in 1855, and immediately went into the cotton business with his father. At the outbreak of the civil war he raised and equipped for the Confederate army a regiment known as the Rutledge Mounted Riflemen, and with it he served as colonel through the war. After the war he returned to the cotton business. In 1885 he was appointed United States Civil Service Commissioner. After serving one year he was made Comptroller of the Currency, and he held that office till 1889. At the close of his term he accepted the presidency of the American Surety Company of New York city. In 1897 he resigned this office and in 1898 became president of the North American Trust Company. He retired from active business in May, 1899. He was the author of *The People's Money* (1893).

Tucker, William Wallace, inventor, born in New Britain, Conn., Dec. 13, 1838; died in Hartford, Conn., July 7, 1901. He entered the Stevens shop in Brookfield, Mass., and at the age of nineteen was its superintendent. Later he removed to Westerly, R. I., where he was employed by Cottrell & Babcock, manufacturers of printing-presses. In 1861 he entered the employ of the Pratt & Whitney Company, Hartford, where he remained till March, 1898, when he entered into business with his son as the Tucker Supply Company. He was the inventor and patentee of many parts of the automatic screw machines.

Turchin, John Basil (Ivan Vasilevitch Turchininoff), soldier, born in the province of Don, Russia, Jan. 30, 1822; died in Anna, Ill., June 19, 1901. He was graduated at the Artillery School in St. Petersburg in 1841, and was appointed an ensign in the artillery service. He took part in the Hungarian campaign, and was graduated at the military academy for officers of the general staff in 1852. In the Crimean War he reached the rank of colonel of the Imperial Guards. He removed to the United States in 1856, and was employed as a civil engineer by the Illinois Central Railroad till the outbreak of the civil war. He was commissioned colonel of the 19th Illinois Volunteers in July, 1861, and joined Gen. Buell in Tennessee, where the latter placed him in command of a brigade. Turchin offered a plan to his superior officers for the capture of Huntsville that was accepted and proved successful. In recognition of this service he was made a brigadier-general of volunteers, and served in the Army of the Cumberland till October, 1864, when he resigned. After the war he was a solicitor of patents in Chicago, and in 1870 he resumed his profession of civil engineering. In 1873 he established the Polish colony of Radom, in Washington County, Illinois, where he afterward lived. In April, 1901, he was pronounced insane. He wrote for scientific and military periodicals, and published *Military Rambles* and *The Campaign of Chickamauga*.

Tuttle, Henry H., inventor, born in Iowa, Dec. 19, 1844; died in Tacoma, Wash., Oct. 9, 1901. He removed to Tacoma in 1889 and practised medicine till 1898, when he abandoned his profession to study and experiment in explosives. Thorite, which he had invented, was the result of his experiments shortly after the beginning of the Klondike craze while he was working for an explosive to use in the frozen ground of that region. The invention at once attracted attention in army circles in Washington, and

successful tests were made by the Government. Congress appropriated \$50,000 for the purchase of the thorite invention in conjunction with the Isham shell, but the negotiations never were completed on account of technical difficulties.

Tuttle, Joseph Farrand, educator, born in Bloomfield, N. J., March 12, 1818; died in Indiana, in June, 1901. He was graduated in Marietta College in 1841, and at Lane Theological Seminary, Cincinnati, in 1844. From 1845 till 1847 he was pastor of the Presbyterian Church in Delaware, Ohio, and from 1847 till 1862 in Rockaway, N. J. In 1862 he was chosen president of Wabash College, Indiana. He held the office till June, 1892, when he was retired.

Uhl, Edwin Fuller, lawyer, born in Rush, N. Y., Aug. 14, 1841; died in Grand Rapids, Mich., May 17, 1901. He removed with his parents to Michigan in 1844, was graduated at the University of Michigan in 1862, studied law, and in 1864 was admitted to the bar. In 1871-'72 he was prosecuting attorney for the county of Washtenaw. In 1876 he removed to Grand Rapids, where for eleven years he was a law partner of Lyman D. Norris. In 1890 he was elected mayor of Grand Rapids, and in 1891 was reelected. In October, 1893, he was appointed Assistant Secretary of State by President Cleveland, and during the illness of Secretary Gresham Mr. Uhl was for a time the *de facto* Secretary of State. The most important matter entrusted to him while holding this office was the arbitration of the boundary between Brazil and the Argentine Republic. In February, 1896, he was appointed Ambassador to Germany. A year later he resumed his practise.

Van Santvoord, Cornelius, clergyman, born in Belleville, N. J., April 8, 1816; died in Kingston, N. Y., Oct. 31, 1901. He was graduated at Union College in 1835, and took a theological course at Rutgers and Princeton. His first charge was in Canastota, N. Y., in 1838, and he continued in the ministry at various places till the outbreak of the civil war. He was appointed chaplain of the 20th New York Regiment, and later was made chaplain in the regular army, being stationed at Nashville and Louisville. While in these cities he was war correspondent for the New York Times. In 1869 he became associate editor of the Chicago Republican. From 1871 till 1876 he served as school commissioner of Ulster County, New York. He was the author of Discourses on Special Occasions and Miscellaneous Papers (1856); Memoir of Eliphalet Nott (1876); and Limitation of the Liabilities of Ship Owners under the Laws of the United States (1887). He received the degree of D. D. from Rutgers in 1853.

Van Vliet, Stewart, soldier, born in Ferrisburg, Vt., July 21, 1815; died in Washington, D. C., March 29, 1901. He was graduated at West Point in 1840 and assigned to the 3d Artillery as 2d lieutenant; promoted 1st lieutenant, Nov. 19, 1843; captain, Dec. 24, 1853. He was made regimental quartermaster March 28, 1847, and assistant quartermaster June 4, 1847. He was appointed assistant quartermaster-general with rank of colonel June 6, 1872, and retired Jan. 22, 1881. His early services consisted mainly of garrison duty in Louisiana, Georgia, and South Carolina. In the war with Mexico he took part in the battle of Monterey and the siege of Vera Cruz. In 1847 he was on duty with the Missouri Mounted Volunteers who protected the Oregon route. Later he fitted out Gen. Johnston's expedition against the Mormons. In the civil war he was appointed quartermaster with rank of major, Aug. 3, 1861, and promoted brigadier-general of

volunteers Sept. 23, 1861. He became chief quartermaster of the Army of the Potomac and was present at the siege of Yorktown and the battles of Fair Oaks, Gaines Mill, and Malvern Hill. He was brevetted lieutenant-colonel, colonel, and brigadier-general Oct. 28, 1864, and major-general March 13, 1865, for distinguished service in the quartermaster's department.

Very, Lydia Louisa Anna, educator and author, born in Salem, Mass., Nov. 2, 1823; died there, Sept. 10, 1901. She was a sister of the late Rev. Jones Very, and for thirty-four years taught in the schools of her native town. She contributed both verse and prose to the Salem and Boston newspapers, and possessed some skill as an artist. Her writings include Poems (1856); Poems and Prose Writings (1890); Sayings and Doings among Insects and Flowers (1897); Sylph, the Organ-Grinder's Daughter (1898); A Strange Disclosure (1898); A Strange Recluse (1899); and An Old-fashioned Garden and Walks and Musings Therein (1900).

Waite, Davis Hanson, ex-Governor of Colorado, born in Jamestown, N. Y., April 9, 1825; died in Aspen, Col., Nov. 27, 1901. He was educated in the village school and Jamestown Academy, and studied law. In 1850 he removed to Wisconsin, where he was engaged in mercantile pursuits in Fond du Lac and Princeton. In 1857 he was elected to the Legislature. He went to Missouri in 1859, and taught school in Houston two years. In 1861 he returned to Jamestown, where he edited the Chautauqua Democrat, a Republican newspaper; later he purchased the Jamestown Journal, which he published till 1876. In 1876 he emigrated to Larned, Kan., where he practised law and conducted a ranch three years. In 1879 he went to Leadville, Col., practised law there two years, and then settled in Aspen. There he practised law and edited the Union Era, a reform paper. He was one of the organizers of the People's Party and was a delegate to their convention in Omaha in 1892. The same year he was elected Governor of Colorado by the Populists. His administration was tempestuous. By a spirited political utterance while Governor he earned the sobriquet "Bloody Bridles Waite." Twice he called out the militia, once to maintain order in Cripple Creek during the miners' strike, and again to seat his appointees on the Denver Fire and Police Board. He was defeated for reelection in 1894.

Walker, James Alexander, soldier, born in Augusta County, Virginia, Aug. 27, 1832; died in Wytheville, Va., Oct. 20, 1901. He was graduated at the Virginia Military Institute in 1852, studied law at the University of Virginia, and was admitted to the bar in 1856. At the outbreak of the civil war he entered the Confederate army as captain of an infantry company known as the Pulaski Guards, which became Company C of the 4th Virginia Infantry. In March, 1862, he was made colonel of the regiment, and in May following was appointed brigadier-general and assigned to the command of the "Stonewall Brigade," which he led till wounded at Spottsylvania. During 1864 he was in charge of reserves in Virginia. In February, 1865, he was assigned to Gen. Early's division, which he commanded at the surrender at Appomattox. After the war he resumed the practise of law. In 1872 he was a member of the Virginia Legislature, and in 1877 he was Lieutenant-Governor of the State. He was twice elected to Congress as a Republican.

Wallace, William Henry, jurist, born in South Carolina, March 24, 1827; died in Union, S. C., March 21, 1901. He was graduated at

South Carolina College and studied law. Later he became a planter and then the editor of a newspaper in Union. During the civil war he enlisted in the Confederate army and rose to the rank of brigadier-general. In 1872 he was elected to the Legislature of South Carolina, and in 1876 was made Speaker of the lower house. In 1877 he was elected judge of the 7th Circuit, and he held the office sixteen years.

Ward, Lebbeus Baldwin, civil engineer, born in Vergennes, Vt., Feb. 12, 1834; died in Jersey City, N. J., July 2, 1901. He was associated with his father, John D. Ward, a noted engineer, who installed the first water plant in Jersey City, assisted in the construction of the Erie Railroad tunnel, and of the Morris and Essex Canal, in many of his important undertakings, and early acquired the knowledge of the New Jersey water-supply that later made him one of the most eminent authorities in the State. He was at one time president of the Norfolk, Va., Water Company, but he devoted his life chiefly to a study of the conditions of the water-supply for Jersey City. He was also a member of the State Board of Geological Survey.

Ward, William Greene, soldier, born in New York city, July 20, 1832; died there, Jan. 16, 1901. He was graduated at Columbia College in 1851. During the civil war he was in the service of the United States as lieutenant-colonel of the 12th Regiment, New York Militia, from April 19 till Aug. 4, 1861. He was also colonel of the same regiment from May 31 till Oct. 8, 1862. He participated in the defense of Harpers Ferry and was paroled at its surrender, Sept. 15, 1862. Subsequently he served in the Pennsylvania campaign in Dana's Division and Couch's Corps.

Warner, Neil (William Burton Lockwood), actor, born in London, England, in 1821; died in New York city, in June, 1901. He was educated for the ministry, but became interested in dramatic study and made his first appearance at the Marylebone Theater, London. After further experience in various London theaters, he went to Australia and starred successfully in the principal theaters, appearing in standard drama, chiefly in tragic rôles. In 1868 Mr. Warner came to the United States and made his American début in San Francisco, after which he played on a tour across the continent, and made his first appearance in New York at the New York Theater in the rôle of Othello. After this engagement he acted at the old Bowery Theater, Niblo's Garden, the Grand Opera-House, Wallack's, and at Mrs. F. B. Conway's Brooklyn Theater. He married Miss Bella Chippendale, of Mrs. Conway's company, and with his wife went to St. John, New Brunswick, and played there for one season. Then he went to Montreal and, in partnership with Eugene MacDowell, became manager of the Theater Royal, afterward assuming the management of the Montreal Academy of Music. He made two visits to San Francisco, playing leading rôles in the stock companies in that city. He returned to New York and appeared in Bronson Howard's play, *Aristocracy*, afterward joining Kate Claxton's company, in which he made his last appearance. Mr. Warner was a cousin of Ouida, the novelist.

Warren, Orris Hubert, editor, born in Stockbridge, N. Y., Jan. 3, 1835; died in Syracuse, N. Y., Nov. 23, 1901. He was graduated at Oberlin College in 1858, spent four years in teaching, and in 1862 was ordained by the Oneida Conference of the Methodist Church. For twelve years he served in Utica, Cazenovia, Ithaca, and Baldwinsville. On account of failing health he re-

tired from the ministry in 1873. He became assistant editor of the *Northern Christian Advocate*, and in 1876 was made its editor. He held that place by quadrennial elections of the General Conference till June 1, 1892. In 1877 he was elected a regent of the University of the State of New York. He received the degree of D. D. from Syracuse University in 1878.

Waterman, Lewis Edson, inventor, born in Decatur, N. Y., Nov. 20, 1837; died in Brooklyn, N. Y., May 1, 1901. For a time he taught school in winter and worked at the carpenter's trade in summer. From 1864 till 1870 he represented at Boston the *Ætna Life Insurance Company* of Hartford. His inventive genius turned toward fountain pens, and, after experimenting ten years, in 1883 he placed his first perfected results upon the market. He also originated a successful preserving and condensing process for keeping fresh the juice of grapes.

Weber, Max, soldier, born in Achern, Germany, in 1824; died in Brooklyn, N. Y., June 15, 1901. He was educated at the military academy at Carlsruhe and became a lieutenant. At the outbreak of the German revolution in 1848, with his regiment he joined the insurrectionists, and was elected colonel. After the suppression of the revolution he came to New York city, and for a long time conducted a hotel at William and Frankfort Streets, which was a rendezvous for German refugees. At the outbreak of the civil war he organized what was known as the Turner regiment, of which he was made colonel. May 12, 1862, he was promoted brigadier-general. After the war he was appointed consul at Nantes, France. Later he was tax assessor in New York city, and under President Grant was collector of internal revenue.

Westcott, Robert Folger, organizer of an express company, born in New York city, Nov. 26, 1828; died near Richfield Springs, N. Y., July 19, 1901. When a mere boy he started in New York city a local express line, beginning with one wagon. He extended this from time to time, and then joined the Dodds, who organized Dodd's Express Company. Later he established a company under his own name, of which for a long time he was president. It increased in extent and prosperity until it became one of the principal agencies for local transportation of merchandise and baggage. His interests passed some years ago into the control of a stock company. His summer home was at Richfield Springs, of which village he was elected president in 1891.

Whipple, Henry Benjamin, clergyman, born in Adams, Jefferson County, N. Y., Feb. 15, 1822; died in Faribault, Minn., Sept. 16, 1901. He prepared for college, but on account of ill health entered mercantile life and became active in political affairs. At length he took a private theological course and was ordained deacon in the Episcopal Church in 1849 and priest in 1850. He was rector of Zion Church, Rome, N. Y., 1850-'57, and of the Church of the Holy Communion in Chicago, 1857-'59. In October, 1859, he was consecrated the first Bishop of Minnesota. Very shortly after his elevation to the episcopate he was prominent among the organizers of the Seabury Mission at Faribault, from which have sprung the cathedral of Our Merciful Saviour, Seabury Divinity School, St. Mary's Hall, a school for girls, and the Shattuck School for Boys. For many years Bishop Whipple was known as "the apostle to the Indians," and the Indians themselves gave him the appellation of "Straight Tongue." Few men have comprehended the various phases of the difficult problem so perfectly as

he, and it is quite safe to say that scarcely a reform in the management of Indian affairs that has taken place within the past forty years was unforeseen as needful in his judgment of the matter during the first year of his episcopate. At the time of the Sioux massacre in 1862 Bishop Whipple declared that the blame was directly traceable to the false dealing of the whites with their Indian neighbors, and when threatened with violence for saying this, replied: "These things are true, and the nation needs to know them; and, so help me God! I will tell them if I am shot the next minute." In 1876 the bishop secured the Sioux treaty, which opened the most fertile parts of Dakota to white settlement. The counsel and advice of Bishop Whipple were sought in relation to Indian affairs by every President of the United States from Lincoln to McKinley. He had traveled extensively, and was well known and honored in England as well as at home, and was revered by men of all creeds and no creed. Besides vigorous pamphlets on the Indian question and sermons and charges, the bishop published *Lights and Shadows of a Long Episcopate* (1899), in which will be found a very strong presentation of the Indian problem.

White, Greenough, clergyman, born in Cambridge, Mass., in 1863; died at Sewanee, Tenn., July 3, 1901. He was educated at Harvard, and was graduated at the Episcopal Theological School in Cambridge in 1892, being admitted to the priesthood in 1896. While still in deacon's orders he had been in charge of St. James's Church, West Hartford, Conn., 1893-'94, but this was his only pastorate. He was Professor of English Literature in the University of the South, at Sewanee, 1886-'87, and of History and Political Economy at Trinity College, Hartford, 1893-'94. He then returned to Sewanee, and was Professor of Ecclesiastical History and Polity there from 1894 until his death. He was the author of *Outline of the Philosophy of English Literature* (1895); *A Saint of the Southern Church: A Memoir of Nicholas Hamner Cobbs* (1897); *An Apostle of the Western Church: A Memoir of Rt. Rev. Jackson Kemper* (1899); *An Outline of the Philosophy of American Literature*; and *The Rise of Papal Supremacy*. He edited *Matthew Arnold and the Spirit of the Age* (1898).

White, Stephen Mallory, lawyer, born in San Francisco, Cal., Jan. 19, 1853; died in Los Angeles, Cal., Feb. 21, 1901. He was graduated at Santa Clara College in 1871, studied law, was admitted to the bar in 1874, and began to practise in Los Angeles County. In 1882 he was elected district attorney on the Democratic ticket. In 1884, and again in 1886, he was chairman of the Democratic State Convention. In 1886 he was elected to the State Senate. In 1888, on the death of Gov. Bartlett, he discharged the functions of Lieutenant-Governor. In 1890 he was an unsuccessful candidate for the United States senatorship, but in 1893 was elected to that office.

Wigger, Winand Michael, clergyman, born in New York city, Dec. 12, 1841; died in South Orange, N. J., Jan. 5, 1901. He was educated for the priesthood at St. Francis Xavier College, New York city, and at Seton Hall College, South Orange, N. J., where minor orders were conferred upon him, in December, 1861. In 1862 he went to Genoa, Italy, where he finished his theological course in the College of Brignoli Sali. In 1865 he was ordained a priest. He returned to the United States and was appointed an assistant priest at St. Patrick's Cathedral, Newark, N. J.; later he was stationed for short periods at St. John's Church, Orange, St. Vincent's Church,

Madison, and the church at Milburn. In July, 1881, he was appointed Bishop of Newark. He received the degree of D. D. from the College of Brignoli Sali in 1865.

Wildman, Rounseville, journalist, born in Batavia, N. Y., March 19, 1864; died in the Pacific Ocean, near California, Feb. 22, 1901. He was graduated at Syracuse University, and became editor of the *Idaho Statesman* at Boise City. Later he was sent to Congress as Territorial Delegate, and it was largely due to his efforts that Idaho was admitted to statehood. In 1889 he was appointed consul-general at Singapore; he served three years, and was transferred to Bremen. When he returned to the United States he devoted himself to magazine work, and was for a time editor of the *Overland Monthly*. In May, 1898, he was appointed consul-general at Hong-Kong, and he was prominently before the public in connection with the war in the Philippine Islands. He was on leave of absence and on his way home on the steamer *City of Rio Janeiro*, when the ship struck on a reef and he was among those who were drowned.

Williams, Alonzo, educator, born in Foster, R. I., Sept. 14, 1842; died in Providence, R. I., March 16, 1901. He worked in cotton-mills in his youth and served for a time in the army during the civil war. He was graduated at Brown University in 1870, became a professor there, and from 1892 was at the head of the Germanic seminar. He was the author of technical works and lectures bearing upon the modern languages.

Williams, Robert, soldier, born in Culpeper County, Virginia, Nov. 5, 1829; died in Plainfield, N. J., Aug. 24, 1901. He was graduated at West Point, and entered the service as brevet 2d lieutenant of the 1st Dragoons, July 1, 1851; promoted 2d lieutenant, July 15, 1853; 1st lieutenant, June 7, 1855. He was made assistant adjutant-general, with the rank of brevet captain, May 11, 1861; promoted captain, Aug. 3, 1861; lieutenant-colonel, Feb. 22, 1869; colonel, July 1, 1881; and appointed adjutant-general, with the rank of brigadier-general, July 5, 1892; he was retired Nov. 5, 1893. In the volunteer service in the civil war he was commissioned colonel of the 1st Massachusetts Cavalry, Oct. 7, 1861; promoted major, July 17, 1862; and resigned, Oct. 1, 1862. He took part in the battle of Antietam and was brevetted lieutenant-colonel, Sept. 24, 1864; colonel and brigadier-general, March 13, 1865, for diligent, faithful, and meritorious service in the department of the adjutant-general during the war.

Williams, Stephen Robbins, philanthropist, born in Amityville, N. Y., Sept. 25, 1832; died there, Jan. 30, 1901. For several years he was superintendent of the poor of Suffolk County, and in 1887 he founded the Brunswick Home for Invalids. He also incorporated a similar institution at Westport, Conn.

Wilson, Thomas, soldier, born in Washington, D. C., June 10, 1832; died in New York city, May 30, 1901. He was graduated at West Point in 1853, and assigned to the 6th Infantry as brevet 2d lieutenant; promoted 2d lieutenant 5th Infantry, Oct. 26, 1854; 1st lieutenant, April 1, 1857; commissary of subsistence, with rank of captain, Oct. 25, 1861; lieutenant-colonel, Dec. 26, 1863; major, May 20, 1882; made assistant commissary-general of subsistence, with the rank of lieutenant-colonel, Aug. 1, 1892; promoted colonel, June 1, 1896; and retired, June 10, 1896. Before the civil war he was on frontier duty in Texas and also engaged against the Seminole Indians in Florida. He was present at the battle of Antietam, and was chief of commissariat of

the Army of the Potomac during the operations against Richmond. He was brevetted colonel of volunteers Aug. 1, 1864, and brigadier-general of volunteers March 13, 1865, for faithful and meritorious service. After the war he served as depot commissary at Baltimore till 1872, at Omaha and other places in the West till Nov. 8, 1887, when he became purchasing and department commissary at Chicago.

Withers, Frederick Clarke, architect, born in Shepton Mallet, England, Feb. 4, 1828; died in Yonkers, N. Y., Jan. 7, 1901. He studied architecture in London and other places eight years. In 1852 he began to practise his profession in Newburg, N. Y. At the outbreak of the civil war he joined the National army as 1st lieutenant, New York Engineers; he was injured in the service in 1862 and returned to New York city, where he resumed the practise of architecture. Among the buildings designed by him are the Jefferson Market Court-House, New York city; the Hudson River State Hospital, Poughkeepsie; the Deaf-Mute College, Washington; and the New York City Asylum for the Insane, in Central Islip, Long Island. He published *Church Architecture* (1874).

Woods, Eliza, educator, born in Belfast, Ireland, about 1850; died in New York city, March 8, 1901. She was brought to the United States by her parents, and received her education in the public schools of New York city and in the Saturday normal classes. When the Normal College of the City of New York was founded, in 1870, Miss Woods was chosen to be the first assistant in the department of mathematics. Later she was transferred to the department of psychology. Upon the death of Miss Lydia T. Wadleigh, in 1888, she was appointed woman superintendent, and she held that place, also occupying the chair of Ethics, till her death.

Woods, William Allan, jurist, born in Marshall County, Tennessee, May 16, 1837; died in Indianapolis, Ind., June 28, 1901. He was graduated at Wabash College in 1855, and in 1860 removed to Marion, Ind., where he studied law and was admitted to the bar in 1861. He began the practise of his profession in Goshen, Ind., in 1862. In 1866 he was elected to the Legislature. In 1873 he was elected judge of the 34th judicial circuit, and he served by reelection till 1881, when he was elected judge of the State Supreme Court; subsequently he was made Chief Justice. In 1883 he was appointed United States district judge for the district of Indiana, and removed to Indianapolis. In 1892 he was reappointed judge, and was confirmed by a bare majority of the Senate. He issued the injunction against interference with the mails by railroad strikers in 1894, and sentenced Eugene V. Debs and other officers of the American Railway Union to prison for violating the injunction.

Woolf, Benjamin E., playwright, musician, and dramatic critic, born in London, England, in 1836; died in Boston, Mass., Feb. 7, 1901. He came to America in early youth, and in 1856 became the first violinist in the Boston Museum orchestra. After a time he took up the work of a playwright, and wrote altogether more than a hundred plays and librettos, his most successful dramatic work being *The Mighty Dollar*, in which the late William J. Florence acted for many years. His most important musical work was the comic opera *Westward Ho*. Mr. Woolf was director of music in many of the leading theaters of the country at different times during his career. In 1871 he became dramatic critic for the Boston *Saturday Evening Gazette*, holding that place un-

till 1893, when he left the *Gazette* to occupy a similar place on the staff of the *Boston Herald*. During his long experience as a critic of music and the drama he won considerable distinction by reason of his frank, intelligent criticism, always expressed with justice and clearness, and often brightened with flashes of keen wit. In 1867 he married Josephine Orton, of the Boston Museum stock company.

Wright, Elias, civil engineer, born in Durham, N. Y., June 22, 1830; died in Atlantic City, N. J., Jan. 2, 1901. He was educated in a district school, of which he subsequently became the teacher. He removed to Atlantic City in 1852, where he taught for several years. He then studied civil engineering. In the civil war he was commissioned 2d lieutenant in the 4th New Jersey Infantry, Aug. 17, 1861; he was promoted 1st lieutenant Jan. 3, 1862; captain, December, 1862; major, June, 1863; lieutenant-colonel, April, 1864; colonel, August, 1864; and brevetted brigadier-general of volunteers in January, 1865. He took part in all the battles in which his regiment was engaged, but at the battle of Gaines Mill, June 27, 1862, was captured and confined in Libby Prison seven weeks. After the war he returned to civil engineering at Weymouth and Atlantic City, N. J.

Xavier, Henry, horticulturist, born near Lyons, France, March 26, 1826; died in Mount Vernon, N. Y., June 19, 1901. He came to the United States when young, and for a time was in business in Fort Hamilton, N. Y.; in 1853 he removed to Mount Vernon. He made many trips to Europe in connection with the introduction of wine-producing grape-vines into this country. He brought practically every known species from Italy, France, Spain, Germany, and Hungary.

Yeatman, James Erwin, philanthropist, born in Bedford County, Tennessee, Aug. 23, 1818; died in St. Louis, Mo., July 7, 1901. He removed to St. Louis in 1842, and was the owner of an iron-foundry there for many years. During the civil war he was a Union sympathizer, and was one of a commission sent to Washington to explain the status of local affairs to President Lincoln. In 1864 he was appointed president of the Western Sanitary Commission, which established hospital steamers, soldiers' homes, and relief bureaus. Although a slaveholder before the war, he devised the organization of the Freedmen's Bureau, and made an official report to Washington in which he advised the leasing of abandoned cotton plantations to the freedmen. After the war he engaged in the banking business, and was president of the Merchants' National Bank for several years. He was identified with numerous charitable movements.

Younmans, William Jay, author and journalist, born in Milton, Saratoga County, N. Y., Oct. 14, 1838; died in Mount Vernon, N. Y., April 10, 1901. He spent his early years on his father's farm, going to the district school and studying chemistry and other scientific subjects under the direction of his brother, Prof. Edward L. Youmans. He next attended the Fort Edward Academy, and in 1858 went to New York city, where he took a special course in chemistry at Columbia College under Prof. Joy, subsequently going to the Sheffield Scientific School, New Haven, where he studied physiology and chemistry. He was graduated in the medical department of the New York University in 1865. He then spent a year abroad, devoting most of his time to special scientific work under the direction of Prof. Huxley. He settled in Winona, Minn., where he began the practise of medicine. In 1871 his brother planned the *Popular Science Monthly*, and Dr.

Youmans was soon called to help him. The first number of the magazine was issued in May, 1872, and from that time until a year before his death Dr. Youmans was actively associated with its management. After his brother's death, in 1887, and indeed for several years previously, owing to the latter's feeble health, the entire editorial work was in his charge. His chief literary work was done in connection with this magazine, which for many years was the leading exponent of the evolution philosophy of Herbert Spencer, and at the time of its establishment was practically the only periodical in America which would print evolutionary material. It did an important work in popularizing this and other scientific theories, and was undoubtedly a powerful factor in bringing about the present educational awakening regarding the importance of scientific education. He collaborated with Prof. Huxley in the preparation of the latter's *Physiology for the American edition*, edited a volume of biographies under the title *Pioneers of Science in America*, and had been a regular contributor of scientific articles to this *Cyclopædia* for many years. He was a fellow of the American Association for the Advancement of Science, and of the New York Academy of Science, as well as a member of many of the other scientific bodies of the country. He will be remembered by his friends and associates for his devotion to the cause of scientific education, his outspoken hatred of shams of every kind, and his unflinching faithfulness to his ideals of scientific as well as practical morality.

Young, Harvey B., artist, born in Vermont in 1840; died in Colorado Springs, Col., May 4, 1901. At nineteen years of age he combined prospecting, mining, and sketching in California, Nevada, Oregon, and Colorado. In 1879 he settled in Manitou, later he removed to Denver, and finally to Colorado Springs. He made several trips to Europe, and studied art in Munich, and in Paris under Carolus Duran. In the Salon of 1878 he exhibited *Spring and The Environs of Grez*. His other works include *La Sal*, which hangs in the Perkins Fine Arts Hall, Colorado College; *The Miner's Friend*; *A Mexican Home*; *Ogden Mountain, Utah*; *Lake George, Colorado*; *Pappago Village*; and *Salt Lake Valley*.

Zeller, Theodore, naval officer, born in New York city, Dec. 1, 1823; died there, June 30, 1901. He was appointed to the navy as third assistant engineer, June 15, 1843; promoted second assistant engineer, July 10, 1847; first assistant engineer, Feb. 26, 1851; chief engineer, June 27, 1855; and retired, Dec. 1, 1885. He served on the frigate *Missouri*, which was burned at Gibraltar, Sept. 26, 1843, and on the steamship *Col. Harney* in the Gulf of Mexico. During the war with Mexico he served on the steamships *Union* and *Iris*. In 1849 he was sent to the Pacific Ocean to join the *Massachusetts*, which was detailed

with a commission of army and navy officers to select a site for a navy-yard in California. In 1861 he was ordered to New York city to super-

intend the building of machinery for gunboats. In May, 1863, he was appointed fleet engineer of the Eastern Gulf squadron, and he remained on the staff of Rear-Admiral Theodorus Bailey till September, 1864. After the war he was stationed in New York and Philadelphia till 1874. In 1875 he was sent to Europe to examine dock-yards, and in 1877 became a member of the experimental board to examine improvements in machinery. He was president of the board in 1884. In 1885 he was retired with the rank of commodore.

OBITUARIES, FOREIGN. Abbott, Evelyn, English scholar, born in 1843; died in Malvern, England, Sept. 3, 1901. He was educated at Oxford, and gained a fellowship. Soon after he took his degree paralysis of the lower limbs rendered him an incurable invalid. He was, however, active in his duties as college tutor, and was greatly beloved by his pupils. He mingled freely in the social and educational life of his college, being wheeled on a couch to lecture-room or dinner-party, and bore his great trial with cheerful dignity. Besides translating from the German Duncker's *History of Antiquity* (1877-'82), as well as classical works for the use of students of Greek, he edited the *Hellenica* (1880), a collection of essays on classical subjects by modern scholars, and was the author of *History of Greece* (1882-1900); *A Skeleton Outline of Greek History* (1885); *Pericles and the Golden*

Age of Athens (1891); and Life and Letters of Benjamin Jowett, with L. Campbell (1897).

Abdurrahman Khan, Ameer of Afghanistan, born in Cabul in 1844; died there, Oct. 3, 1901. He was the eldest son of Afzul Khan, who was the eldest but not the noblest born of the sons of Dost Mohammed, whom the British restored in 1842, after having deposed him in 1840. When Dost Mohammed died, in 1863, he nominated as his successor Shere Ali, a younger son, who confirmed Abdurrahman in a post to which his grandfather had appointed him in Afghan Turkestan, he having married a daughter of the Khan of Badakshan and possessing much influence among the Uzbeks. Hence he was able to supply his father and Uncle Azim with the major part of the fighting force with which they drove out Shere Ali, compelling him to flee to his son Yakub at Herat. Afzul mounted the throne at Cabul, and when he died Azim was proclaimed his successor, in which step Abdurrahman acquiesced, but not his followers. Shere Ali returned from Herat with an army which Yakub Khan led to victory, driving Azim out to perish in the desert and Abdurrahman to take refuge in Bokhara and afterward with the Russians in Samarcand. He was an active, ambitious, energetic prince, who had neglected books in his youth for sport, but was interested in arms and warlike exercises and learned to be a shrewd and bold but cautious politician. While Shere Ali lived Abdurrahman remained quiet and unobserved, a Russian pensioner in Samarcand. His time came after his uncle and rival died, in 1879, at Balkh, where he was waiting for aid promised by the Russians. Abdurrahman was a poor general, and had little chance against the organized forces of Yakub Khan, who had thoroughly outmaneuvered him in the campaign of 1867. The murder of Sir Louis Cavagnari, the English envoy at Cabul, in the fall of 1879, resulted in the occupation of the capital by a British army and the flight of the Ameer Yakub Khan. Abdurrahman then raised a little army with Russian assistance and crossed the Oxus in the beginning of 1880. The Beaconsfield Government in England wished to retain Candahar as a British post and to control Afghanistan after the evacuation of Cabul by dividing the country among the chiefs. The defeat of the ministry was the defeat of the forward policy, and the object of the Liberal Administration that succeeded was to end the costly and perilous occupation of Afghanistan and the crisis in the relations with Russia by scuttling as rapidly as possible back to the Himalayan passes, retaining Baluchistan, but no part of the Afghan territory. Lord Lytton, the Viceroy of India, had already opened negotiations with Abdurrahman with the view of making him lord in the north, where the population seemed favorably disposed toward him. Sir Lepel Griffin, who was political agent with the British forces, was now instructed to negotiate on the basis of his being recognized as Ameer of Cabul. He accordingly crossed the Hindu Kush and established his camp within a short distance of Cabul, and when disaster overtook the British force at Maiwand, in July, he rendered assistance to Lord Roberts in facilitating the withdrawal of the British detachments to Candahar. Before Sir Donald Stewart retired with the main body Sir Lepel Griffin formally recognized Abdurrahman as Ameer of the whole of Afghanistan, and the Indian Government furnished him with money, arms, and ammunition to enable him to assert and maintain his authority. Ayub Khan, his most formidable rival, had already been crushed by Lord Roberts at Canda-

har. At Cabul and Ghuzni the powerful Yakubzai faction, led by Mohammed Jan, contested the throne on behalf of Yakub Khan's son, Mussa Khan. The great Ghilzai tribes were strongly opposed to him. There was indeed no section of the Afghan nation well affected toward the *protégé* of the British. He had a long and a hard contest before he was established in authority, and he used every treacherous and cruel means to get his enemies into his power and strike terror into the restless and turbulent Afghan tribes. Gen. Mohammed Jan was perfidiously seized and thrown into a dungeon, from which he never emerged, and one after the other all the leaders of hostile factions and even friends who grew too powerful were in similar fashion put out of the way. He had to defend himself against the Ghilzai tribes, and did not succeed in reducing them to subjection until ten years had passed. Ayub Khan attempted in 1881 to recapture Candahar, but his weak force was easily beaten by Abdurrahman, who subsequently captured Herat, and was then the nominal ruler of all the Afghan provinces, but he had to subjugate some of them again and again and crush out opposition with ruthless severity before his rule was undisputed. In the end he organized and governed his kingdom with more authority than any of his predecessors possessed in recent times. The instrument of his power was the trained and disciplined army using modern weapons which the gifts of arms from the Indian Government and the subsidy of £120,000 a year allowed from 1883, and increased later to £180,000, enabled him to create and maintain. After the occupation of Merv by the Russians, in 1884, he allowed the British Government to arrange with Russia a delimitation of his northern borders, which on the upper Oxus were finally demarcated after a long dispute over the treaty in 1895. In the south he had no powerful ally to guard his interests, and was engaged in constant disputes with the British, who, whenever Russia displayed any military or railroad activity in Turkestan, pressed forward to some supposed point of vantage for the defense of the numerous little passes in the mountains. This obliged him to develop considerable military power in these regions among the tribes, but he never came into open conflict with the British. Ishak Khan, who had joined him in his original invasion of Afghanistan and was rewarded with the governorship of the province of Afghan Turkestan, laid plans to oust his cousin. Abdurrahman, in his usual way, when he heard of this intrigue, invited Ishak to pay him a visit in Cabul. Ishak preferred an open fight to being poisoned at table or stabbed in prison, and hastened his preparations for defense while Abdurrahman with his army marched with the utmost speed through the passes of the Hindu Kush. Notwithstanding the enormous superiority of his force in number and quality, the Ameer, through faulty tactics, almost lost the battle when the two bodies met. The victory, though narrowly won, was complete, however; but he deemed it necessary to remain two years in Turkestan, leaving his son Habibullah to rule in his stead at Cabul. Returning in 1890, he sent his troops into the south to counteract British encroachments. This involved him in a serious dispute with England, and when it was proposed that he should go to India or that Lord Roberts should go to Cabul to talk about a settlement, he declined both propositions. Sir Mortimer Durand finally arranged and carried out a compromise which gave Kafiristan to the Ameer and Chitral and the passes of the Kunar valley to Great Britain. On receiving the order of the

Bath in 1895 he sent his son Nasrullah Khan to England to arrange for a permanent diplomatic representation of Afghanistan by an accredited agent in London, but to this the British Government would not accede. His eldest son, Habibullah Khan, whom he chose to succeed him, he trained in high military commands and in judicial and executive offices and the management of the treasury to continue his iron rule over an undivided Afghanistan by means of his powerful army equipped with modern weapons. Besides the allowance from the Indian Government, Abdurrahman established monopolies and collected taxes such as no ameer of Cabul had ventured to impose before, and the revenue he spent mainly in improving the army, buying munitions, building arsenals, and establishing manufacturing establishments at Cabul, which in turn produce revenue. He also sought to make the nation strong by improving the condition of the people and introducing civilized arts. He made roads, extended irrigation, promoted agriculture, and encouraged suitable industries. His attention to all details of government was systematic and assiduous despite poor health. He was a man of lofty stature, and in his prime he had enormous strength and vitality. Later he became corpulent, and his strength was undermined by chronic disease. His score of well-armed regiments are formidable for the defense of Afghanistan on either frontier. The British, who originally lent him the means to consolidate his power, were under no illusion as to his subservience or that of the Afghans under any ruler to any policy of theirs that did not coincide with the interests and was not based on the independence of Afghanistan. Habibullah Khan, who succeeded his father without having to encounter the usual opposition, is a man of twenty-eight years, pleasing in person and manners, and has the name of being capable. (See portrait on page 4.)

Arthur, William, English clergyman, born in Kells, Ireland, Feb. 3, 1819; died in Cannes, France, March 9, 1901. At the age of sixteen he began preaching as a Wesleyan Methodist, and a year later he entered Hoxton Theological College, near London. At twenty-one he went as a missionary to southern India, returning three years later. His experiences during this period are narrated in his *A History of the Mysore* (1847). He also published *The Successful Merchant* (1852); *The Tongue of Fire* (1856); *Addresses in New York* (1856); *Italy in Transition* (1860; sixth edition, 1877); *The Modern Jove* (1873); *The Pope, the Kings, and the People* (1877); *On the Difference between the Physical and the Moral Law* (1883); *Religion without God: Part I, Positivism and Mr. Frederic Harrison; Part II, Agnosticism and Mr. Herbert Spencer* (1884); *The People's Day* (1885); *God without Religion: Deism and Sir James Stephen* (1887).

Audran, Edmond, a French composer, born in Lyons, April 11, 1842; died in August, 1901. He was educated at the École Niedermeyer in Lyons and began his professional career as organist of the Church of St. Joseph, at Marseilles. He was a prolific composer of marches, overtures, masses, etc., but his reputation is mainly founded upon the many light operas of which he was the author. He removed to Paris in 1861, and after that date produced an oratorio, *La Sulamite* (1876), and the following operas and operettas: *L'Ours et le Pasha* (1862); *La Chercheuse d'esprit* (1864); *La Nivernoise* (1866); *Le Petit Poucet* (1868); *Les Noces d'Olivette* (1879); *La Mascotte* (1881); *Les Pommes d'Or* (1883); *Le*

Grand Mogol (1884); *La Dormeuse Éveillée* (1885); *Pervenche* (1885); *Le Paradis de Mahomet* (1887); *Gillette d'Narbonne* (1890); *Miss Helyett* (1890); *La Cigale*; and *La Poupée*. Audran's music is well known to English and American frequenters of the opera. It is thoroughly popular in cast and excellent of its kind. A rippling, sparkling gaiety is characteristic of all his operas.

Baden-Powell, Baden Henry, a British Indian jurist, born in Oxford in 1841; died there, Jan. 2, 1901. He was the eldest son of an Oxford professor and a half-brother of Gen. Baden-Powell of South African fame. He received his education at St. Paul's School, London, entered the Bengal civil service at the age of twenty, and retired in 1889 as chief judge of the Punjab. He gave attention to Indian forestry, and he cooperated with Dr. Leitner in the establishment of the Oriental University at Lahore. The principal subject of his studies was land tenures in India, and his important works are *Land Systems of British India* and *The Indian Village Community*.

Bagshawe, John Bernard, an English clergyman, died in Brighton, England, Oct. 30, 1901. He was ordained to the Roman Catholic priesthood in 1851, and after serving two years as chaplain in the English army during the Crimean War was rector of St. Elizabeth's Church, in Richmond, Surrey, for the forty-four years preceding his death. His more important works include *The Threshold of the Catholic Church* (1873); *The Catechism Illustrated by Passages from Holy Scripture* (1879); *The Credentials of the Catholic Church* (1879); *Catholic Sermons* (1881); and *The Treasure of the Church*.

Balaguer, Victor, a Spanish poet, born in 1825; died in Madrid, Jan. 14, 1901. He was a native of Catalonia, and endeavored to revive the flower games, the picturesque Limousinian speech, and the spirit of the troubadours. Faith, love, and country furnished the burden of his songs. His collected works make 33 volumes. The drama *Don Juan de Serrallonga* he wrote in his youth. Under the designation of *Tragedies* he pictured a series of historical episodes. His *History of the Troubadours* gained for him a seat in the Historical Academy, and his works in belles-lettres his election to the Spanish Academy. He was an earnest political thinker, who believed in a strong, undivided Spain, to which some of his poems were consecrated, while others celebrated the special glories of his narrower Catalonian land. After the victory of the September revolution of 1868 he was appointed vice-president of the revolutionary committee in Barcelona, and henceforth was elected a Deputy many times, mostly by the city of Villanueva y Geltru, to which in gratitude he gave a library and museum, devoting to the foundation the major part of his fortune. He filled many important administrative posts. When Amadeus was king he was several times Minister of Education and Ecclesiastical Affairs and Colonial Minister in the Cabinets of the Duke de la Torre and Sagasta. In 1889 he was nominated a Senator for life.

Baratieri, Oreste, an Italian soldier, born in Condino in the Austrian Tyrol, Nov. 13, 1841; died in Sterzing, in the same province, Aug. 8, 1901. When Garibaldi raised the flag of insurrection in 1859 he joined the thousand at Marsala, and made the march into Sicily. In 1866 he fought again under Garibaldi in the Tyrol, and then entered the Italian army. In 1887 he went to Eritrea in the San Marzano expedition as colonel of *bersaglieri*. He officiated as Governor of Eritrea for a few months in 1891, and

then returned to Italy, where with Count Salimbeni he drew up the code of regulations for the colony which were entrusted to him to put into operation in the following year. He entered on his duties as civil governor on March 30, 1892, and his administration was so successful that after his report was received, in November, 1893, he was proposed for Minister of Foreign Affairs in the Cabinet that Zanardelli undertook to form in 1894, and was only excluded because it was not thought wise, out of consideration to Austria, to appoint an Irredentist of Austrian birth. He achieved important military successes both against the dervishes and against the Abyssinians, occupying Kassala on July 17, 1894, and twice defeating Ras Mangascia in January, 1895. For these services he was promoted lieutenant-general. In March, 1896, he occupied Adigrat, penetrated Tigre, and in October of that year won a battle at Debra Ailat, took possession of Makalle and Amba Alagi, and occupied the whole of that Abyssinian province. His forces were scattered far from their base, and the Shoa army of the Negus Menelek threatened his flanks. He marched from Massowah with reinforcements, formed a junction with Arimondi's beaten troops, and then sat down. In December, 1895, Major Toselli's detachment was beaten at Amba Alagi, and in January, 1896, Makalle had to capitulate. The Government then decided to supersede Gen. Baratieri, but the order was to be kept secret until Gen. Baldissera arrived to take command. He is believed to have learned or to have divined what was impending. At any rate, after a long period of inactivity, he advanced his army by quick marches through a rugged country, intending to strike a decisive blow before his successor could arrive. The three columns could not keep in touch. On March 1 he came upon King Menelek's main army encamped before Adowa, and decided to attack at once, expecting to win the day by surprise and sudden dash. The result was disastrous. The Abyssinians took up the attack, surrounded the Italians, and at the end of the fight 250 officers and 7,000 men were killed, wounded, or prisoners in the hands of the enemy. Gen. Baratieri's military career was ended, and Italy's ambitious colonial dream gave place to bitter disappointment and dismay. He was acquitted by a court-martial, but retired in August, 1896, broken in health from his African experiences. In 1897 he published a book entitled *Memorie d'Africa*, explaining and defending his actions.

Barbier, Paul Jules, a French dramatist, born in Paris, March 8, 1825; died in January, 1901. He produced his first play, *L'Ombre de Molière*, at the Comédie Française in January, 1847. This was followed the next April by *Un Poète*, a five-act drama in verse. Later plays of Barbier's are *Amour et Bergerie* (1848); *André Chénier* (1849); *Bon gré, Mal gré* (1849); *Les Amoureux sans le Savoir* (1850); *Graziella* (1849); *Un Drame de Famille* (1849); *Jenny l'Ouvrière* (1850); *Les Derniers Adieux* (1851); *Les Contes d'Hoffmann* (1851); *Les Marionnettes du Docteur* (1852); *Le Mémorial de Sainte-Hélène* (1852); *Le Maître de la Maison* (1866); *Cora, ou l'Esclavage* (1866); *La Loterie du Mariage* (1866); *Maxwel* (1867). In collaboration with Carré, Labiche, and others he produced many dramas for the Parisian theaters, and he supplied the librettos of such well-known operas as *Les Noces de Figaro*, *Le Pardon de Ploërmel*, *Gounod's Faust*, *Mignon*, *Les Joyeuses Commères de Windsor*, and others. He also wrote several volumes of verse: *Le Franc-tireur*; *Chants de*

Guerre (1871); *The Sheaf* (1882); *Plays in Verse* (1879); *Faded Flowers* (1890).

Bennett, Alexander Hughes, a Scottish physician, born in 1847; died in London, Nov. 1, 1901. He was the son of an Edinburgh professor, and obtained his education in Edinburgh, London, and Paris. He was admitted to the Royal College of Physicians in London in 1871, his specialty being the treatment of epilepsy and paralysis, upon which subjects he had written much. For many years he had been head physician in the Regent's Park Epileptic Hospital, in London. His published works include *Practical Treatise on Electro-Diagnosis in Diseases of the Nervous System* (1882); *Illustrations of the Superficial Nerves and Muscles, with their Motor Points*; *A Statistical Inquiry into the Nature and Treatment of Epilepsy* (1884); *Spastic Paralysis*; *Muscular Hypertonicity in Paralysis*; and *An Experimental Inquiry into the Physiological Actions of Theine*.

Benoît, Pierre, a Belgian composer, born in Harlebeke, Aug. 17, 1834; died in Antwerp, March 18, 1901. He won the Roman prize at the Brussels Conservatory in 1857, became director of an orchestra in Paris in 1861, composed religious and chamber music, and, under the influence of the Flemish literary movement, founded a Flemish school of music which was exemplified in oratorios and cantatas entitled *Lucifer*, *De Schelde*, *Oorlog*, *Le Rhin*, *Onze Vader*, and *Rubens*, and the operas *Charlotte Corday* and *Karel van Gelderland*. He was director of the School of Music at Antwerp from 1867.

Besant, Sir Walter, an English novelist, born at Portsmouth, England, Aug. 14, 1836; died in London, June 9, 1901. He was educated at King's College, London, and Christ's College, Cambridge, and from 1861 to 1867 was a professor in the Royal College on the island of Mauritius. On his return to London he formed a literary partnership with James Rice (1844-'82). The most popular of their collaborations is *The Golden Butterfly*. It seems probable that the lighter and more amusing portions of their fictions were the work of Rice, and it is not unlikely that the motive was Rice's also.

Taking Besant's known work into consideration, it does not entitle him to a place within the first, or even the second class of novelists, although it has many merits and is always entertaining. Besant did not take himself with undue seriousness, however, and the establishment of the People's Palace in 1886, an enterprise directly traceable to the Palace of Delight outlined in his *All Sorts and Conditions of Men*, presumably afforded him more satisfaction than contemplation of his literary popularity. He esteemed Dorothy Forster his best novel, but among the most popular appear to have been *All Sorts and Conditions of Men* and *Children of Gibeon*. He was a stanch, if not invariably a wise, champion

of the claims of authors to fair treatment from their publishers, and devoted an immense amount of time and thought to the work of the Society of Authors, an organization of which he was chairman in 1887-92. He had also been secretary of the Palestine Exploration Fund from 1868. In 1896 he was knighted. With Edward H. Palmer, Besant wrote *Jerusalem, the City of Herod and Saladin* (1871), and with Walter H. Pollock *The Charm and Other Drawing-room Plays* (1898). A list of the works written by Besant and Rice includes *Ready Money Mortiboy* (1871); *My Little Girl* (1873); *This Son of Vulcan* (1876); *The Golden Butterfly* (1876); *The Case of Mr. Lucraft, and Other Tales* (1876); *With Harp and Crown* (1877); *The Monks of Thelema* (1878); *By Celia's Arbor* (1878); *'Twas in Trafalgar's Bay* (1879); *The Seamy Side* (1880); *Sir Richard Whittington, Lord Mayor of London* (1881); *The Ten Years' Tenant, and Other Stories* (1881); and *The Chaplain of the Fleet* (1881). The various books of which Besant was sole author comprise *Studies in Early French Poetry* (1868); *When George the Third was King* (1872); *The French Humorists from the Twelfth to the Nineteenth Century* (1873); *Book of French* (1877); *Gaspard de Coligny* (1879); *Rabelais, for Classics Series* (1879); *The Revolt of Man* (1882); *All Sorts and Conditions of Men* (1882); *Readings in Rabelais* (1883); *All in a Garden Fair* (1883); *Life and Achievements of Edward H. Palmer* (1883); *The Captain's Room* (1883); *The Art of Fiction, a lecture* (1884); *Dorothy Forster* (1884); *Uncle Jack* (1885); *Children of Gibeon* (1886); *To Call Her Mine* (1886); *Katherine Regina* (1887); *The World Went very Well Then* (1887); *The Holy Rose* (1887); *The Eulogy of Richard Jefferies* (1888); *Fifty Years Ago* (1888); *Herr Paulus* (1888); *The Inner House* (1888); *For Faith and Freedom* (1888); *The Bell of Saint Paul's* (1889); *The Lament of Dives* (1889); *Captain Cook* (1890); *Armored of Lyonesse* (1890); *The Demoniac* (1890); *The Chaplain's Secret* (1891); *Saint Katherine's by the Tower* (1891); *The Ivory Gate* (1892); *London* (1892); *Verbena Camellia Stephanotis, and Other Stories* (1892); *Dorothy Wallis* (1892); *The Rebel Queen* (1893); *History of London, abridged* (1893); *Beyond the Dreams of Avarice* (1895); *In Deacon's Orders, and Other Stories* (1895); *Westminster* (1895); *The City of Refuge* (1896); *Master Craftsman* (1896); *The Rise of the Empire* (1897); *A Fountain Sealed* (1897); *The Queen's Reign* (1897); *The Changeling* (1898); *The Pen and the Book* (1898); *South London* (1898); *The Orange Girl* (1899); *The Alabaster Box* (1900); *The Fourth Generation* (1900); *East London* (1901); *The Lady of Lynn* (1901); *The Way Out* (1901); *The Story of King Alfred* (1901).

Bhopal, Shah Jehan, Begum of, born in 1838; died June 16, 1901. Her mother, Sikandar Begum, resisted the efforts of her advisers in 1857 to induce her to join the Indian mutiny, instead of which she sheltered at great risk the English officers fleeing from Indore. The daughter succeeded to the throne in 1868. Her second husband, Sirdar Mohammed Sadik Hussein, while she was in retirement, mismanaged the state and was deprived of power about 1882 by the Indian Government, which sent Col. Ward to conduct the administration and the finances. Her own rule had been firm and just, and since that period the state has made great progress with native ministers. She was fond of Europeans, and was noted for liberality and benevolence as well as for administrative qualities. Her daughter and

successor, the Nawab Sultan Jehan, born in 1867, is the third consecutive female ruler of Bhopal.

Bismarck, Count Wilhelm, a Prussian administrator, born in Frankfurt-on-the-Main in 1852; died in Varzin, May 30, 1901. He was the younger son of Prince Bismarck. He studied at Bonn, entered the dragoon regiment of the guards as a one-year volunteer, went to the front in 1870, and with his brother took part in the charge at Mars la Tour, winning a lieutenancy. In 1873 he was attached as a civilian to the staff of Gen. von Manteuffel, Statthalter of the Reichsland of Alsace-Lorraine, and at the same time was elected member of the Reichstag for Mühlhausen, Thuringia, which he represented till 1881, after which he represented Schlaw Rummelsberg in the Prussian Chamber till 1885, rising meanwhile in the administration to be subpresident of the province of Hanover. When his father was dismissed he did not, like his brother Herbert, who was in the political service, quit office, and in a short time he was advanced to be chief president of East Prussia. He held this office till his death, and in quarrels with the municipality of Königsberg his conduct was considered arbitrary, although his character was genial like that of his father, to whom he bore a striking likeness. From his father he inherited the estate of Varzin.

Block, Maurice, a French statistician, born in Berlin, Prussia, Feb. 16, 1816; died in Paris, Jan. 15, 1901. He lived in Paris from the age of five years, became a naturalized Frenchman, entered the Bureau of Statistics of the Department of Agriculture and Commerce, became assistant superintendent of the bureau, left the public service to write for French and foreign periodicals, won the Montyon prize for statistics in 1861, published a great number of articles and studies on statistical and economical subjects, and was elected to the Academy of Moral and Political Sciences as successor to Léonce de Lavergne.

Böcklin, Arnold, a Swiss painter, born in Basel, Oct. 16, 1827; died in Fiesole, Tuscany, Jan. 23, 1901. He was a silk-merchant's son, and was driven out by his relatives when they could not break his resolution to become an artist. He was the pupil first of the romantic Düsseldorf painter Schirmer, from whose methods as a colorist he gradually departed until no trace of his master's influence can be discerned in his ripper works. He had received a good education in the gymnasium when he arrived without a heller in Düsseldorf, whence he wandered, penniless still, first to Antwerp, then to Paris, and when the terrors of the revolution and his extreme poverty drove him from there to Rome at last, where his characteristic style unfolded. Neither classic nor Renaissance examples attracted him, but the landscape under the Italian sky, as seen in the country around Rome; and then the pagan mysteries of the ancient world began to work upon his romantic spirit. He put figures in his landscapes, not classic in conception but transformed by German fancy and humor into singular grotesque shapes. Needy as ever, simple and ignorant of the world, careless and light-hearted as a child, he astonished his brother artists who commiserated his eccentricity and his lack of worldly wisdom and of worldly goods by his brilliant flashes of thought and imagination, his philosophical reflections, and the extent of his learning. He took a beautiful wife to share his wretched state. Lenbach and Heyse, recognizing his high artistic gifts, induced him to go to Munich, where Count Schack became interested in him, and the few who believed in his

original genius encouraged him to fare forth on his lonely way, producing works that made the general public laugh. His Roman sketches and memories were metamorphosed in his imagination into an unending series of dream pictures. He produced enormously, struggling with colors, not in the way of the modern painters but like an alchemist delving in ancient lore, growing into a colorist whose power and technique were recognized even by many to whom his paintings repelled as fantastic images of a lunatic brain. Wagner, when the world scorned and ridiculed his art, took up the cudgels in its defense, but Böcklin was a shy and lonely soul, who had no answer to make to ridicule and contempt. An easier life as professor in the Weimar Academy enabled him to develop his powers to maturity. He did not stay long there, but took up his final abode under the blue Italian sky again in Florence, where he reproduced its azure depths and the grim cliffs, the translucent sea, the slim poplars, with nymphs, fauns, centaurs in tragic episodes or bucolic scenes, uncertain in drawing, but having qualities of color, line, and composition that impressed and charmed more and more the German lovers of art, but still jarred upon the taste of those schooled in classic forms and modern technique. Less of landscape and more of the grand figure painting characterize his later Italian period, and continued research for the color secrets of the old masters. Recondite and scientific in his technical experiments and processes, as is apparent in his later more studied and ambitious and less exuberant and spontaneous productions, the imagination which conjured up a living, moving world of pagan myth and the riotous, joyous sense of the magic of color are the marks of his genius.

Bogoliepoff, Nicholas Pavlovich, a Russian statesman, born in Serokhof, in the province of Moscow, in 1846; died in St. Petersburg, March 15, 1901. He was the son of a police officer, passed through the law course of Moscow University after receiving a medal in the gymnasium, studied also abroad, became a professor of the university, and was its rector in 1883 and again in 1891, and in 1895 became curator of the educational district. On the death of Count Delianoff, in 1898, the Czar appointed him Minister of Education. He aimed at a reform of intermediate education in which the study of Russian and modern subjects should supplant the classical languages. The students held him responsible for the new regulations adopted at the Moscow and other universities and for the harsh measures adopted to curb and discipline them, and thus he was killed by an assassin's bullet.

Bornier, Vicomte Henri de, a French poet, born in Lunel, Hérault, Dec. 25, 1825; died in Paris, Jan. 21, 1901. He began his literary career by publishing a collection of verse about 1845, followed by a five-act drama, *Le Mariage de Luther*. Some of his later writings obtained prizes from the Institut, and the *Théâtre Français* accepted, in 1868, his *Agamemnon*. He wrote the libretto of Victorin Joncière's *Dimitri*. His most famous work is *Fille de Rolland*, presented at the *Comédie Française* in 1875, with Sarah Bernhardt in the principal rôle, in which the qualities of human interest, realism, skilful construction, dramatic force, strong situations, and clearly drawn characters were set forth by well-turned polished verse in the classical method. After winning the Jean Reynaud prize with this piece he wrote *Les Noces d'Attila*, *La Moabite*, *L'Apôtre*, and *Le Fils d'Arétin*, all dramas in verse. His *Mahomet* was not allowed to be pro-

duced for diplomatic reasons. In 1893 he was elected to the French Academy as the successor of Xavier Marmier, and he held the post of librarian and afterward that of administrator of the arsenal.

Boyle, George David, a British divine, born in Edinburgh, May 17, 1828; died in Salisbury, March 21, 1901. He was the son of an eminent Scottish advocate, afterward Lord Justice-General. He was educated at the Edinburgh Academy, the Charterhouse School, and Exeter College, Oxford, took his degree in 1851, became curate of Kidderminster in 1853, and of Hagley in 1857, and in 1861 perpetual curate of St. Michael, Handsworth. In 1867 he returned to Kidderminster as vicar, was appointed an honorary canon of Worcester in 1872, and in 1880 was made Dean of Salisbury. He was interested in education, a churchman of moderate views, an entertaining talker, full of anecdote and humor, a scholar of wide reading, and a man of many friends. He published a volume entitled *Likes and Dislikes and Characters, and Episodes of the Great Rebellion*.

Brereton, Joseph Lloyd, an English clergyman, born in Little Massingham in 1822; died there, Aug. 15, 1901. His education was obtained at Rugby and at Oxford, where in 1842 he won the Newdigate prize for a poem on the battle of the Nile. He was ordained in the English Church in 1847 and held curacies in Norwich and London in 1847-50. In 1852 he became rector of West Buckland, North Devon, where he established the earliest of the county schools, institutions aiming to give a comprehensive education to children of the middle class, and established upon a county basis as distinguished from a diocesan one. In 1858 he received a prebend's stall in the cathedral of Exeter, and in 1867 succeeded his father as rector of Little Massingham. Soon after this date he founded the Norfolk County School at Elmham, and subsequently he founded Cavendish College, a similar institution, in Cambridgeshire. By the establishment of a graduated county schools association he endeavored to call into existence self-supporting schools for women and girls, and thus work out a complete system of national education. While resident in Devon he founded the Barnstaple Farmers' Club. His published books include *The Battle of the Nile* (1844); *County Education: A Contribution of Experiments, Estimates, and Suggestions* (1874); *The Higher Life: Attempts at the Apostolic Teaching for English Disciples* (1874).

Bretschneider, E., a Russian sinologist, died in St. Petersburg, May 14, 1901. He was a medical man by profession, physician for many years to the Russian legation at Peking, where he devoted himself to the study of Chinese archeology, history, language, and geography. He published *Fu-sang, or Who Discovered China? The Knowledge Possessed by the Ancient Chinese of the Arabs and Arabian Colonies, Chinese Medieval Travels to the West, Archeological and Historical Researches in Peking, Medieval Researches from Eastern Asiatic Sources, On the Study and Value of Chinese Botanical Works, and History of European Botanical Discoveries in China*. He also made one of the best maps of China.

Bright, William, an English ecclesiastic, born in Doncaster in 1824; died in Oxford, March 6, 1901. He was the son of the town clerk, was sent to Rugby school at the age of thirteen, and having been prepared for Oxford under Dr. Arnold, entered University College, was graduated with classical honors in 1846, took a theological

scholarship and was elected a fellow of his college in 1847, was ordained deacon in 1848 and priest in 1850, and in 1851 became theological tutor at Trinity College, Glenalmond, in 1851. For eight years he directed the theological training of all candidates for holy orders in the Scottish Episcopal Church, and was also lecturer on ecclesiastical history. At the end of that period the Scottish College of Bishops dismissed him because he said in a private letter that in some respects the English Reformation was a mistake. He returned to Oxford, where he was still a tutor in University College, and in 1868 was appointed Regius Professor of Ecclesiastical History and a canon of Christ Church. Till that time he had published only a collection of ancient collects from various rituals and a Latin version of the Prayer-Book. He possessed an unrivalled knowledge of the ancient councils and patristic literature, and subsequently he prepared editions of Eusebius and Socrates, works on Athanasius, Augustine, and Leo the Great, and two volumes of sacred poetry—Hymns and other Verses (1874) and Iona and other Verses (1886).

Broglie, Albert, Duc de, a French statesman, born in 1821; died Jan. 19, 1901. He was descended from the Italian family Broglia, long naturalized in France, having furnished under the monarchy a series of ministers, marshals, and diplomatists. Prince Albert was trained for diplomacy, and the fact that his father was a prince of the Holy Roman Empire secured him a good reception at German courts. His career was cut short by the revolution of 1848 just as he had received the appointment from the Government of Louis Philippe of secretary of legation. During the second empire he was as an Orleanist condemned to political inactivity except as an Opposition writer. He wrote for the *Revue des Deux Mondes*, became a historian, publishing *L'Eglise et l'Empire Romain au IV Siècle* in 1856, and was elected to the French Academy in 1862, succeeding to the chair of *Lacordaire*. Although he detested parliamentarism, he came forward as a candidate for the Chamber when the empire was nearing its end. In 1871 he was elected to the National Assembly in the Department of the Eure, where the hereditary seat of the Broglie family was. Thiers kept him away from the Chamber by giving him the appointment of ambassador to London, but he returned occasionally to Versailles, and finally resigned his post in order to engage in active opposition to Thiers and work for the restoration of the monarchy. He was successful in bringing about the resignation of Thiers and the election of MacMahon as President of the French Republic. He was made Premier and Minister, first of Foreign Affairs, then of the Interior. The refusal of the Comte de Chambord to give up the white flag was the first check to his plan to restore the Bourbon throne. When, after the fall of Jules Simon's ministry, the reactionary Broglie-Fourtou Cabinet was ready to attempt a state stroke, President MacMahon would not resort to violent illegality, and thus the republic was once more saved from upheaval and civil conflict. The Chamber was dissolved with the approval of the Senate, but in the succeeding elections the Republicans triumphed. The Duc de Broglie resigned the premiership on May 16, 1877, and retired into private life, discredited and reprobated until the passions he had excited were stilled and he passed into history. His haughty and repellent manners, his small, insignificant figure, his shrill voice and awkward gesticulation, and his contempt for oratorical allurements and flour-

ishes and for all other devices for gaining popularity, would have made him and the cause of the monarchy before the public almost contemptible and ridiculous when he was matched against the genial and brilliant Gambetta, and of the inherent weakness and dissension of the monarchists, contending with three pretensions to two flags for a single crown, did not render the cause hopeless under any leader. The Duc de Broglie was an acute, energetic, and fearless statesman, the most sincere and courageous of the monarchist politicians, whose unattractive personality would not have stood in the way of the restoration of the Bourbons, which he was the most competent to direct, if France could have lived again under the old *régime*, though a more popular politician might in his place have overturned the republic and brought to pass a restoration more untimely and unnatural than the one that the allies forced upon France in 1814, but it would not have survived one free election or the first popular uprising. Broglie retained his seat in the Chamber, keeping silence, however, until the law of Jules Ferry, restricting the clergy, brought him to his feet, after which he subsided again, and was not reelected in 1885. After his exit from the political stage the Duc de Broglie attended the Thursday meetings of the Academy with the utmost regularity, discoursed on politics with the sympathetic ladies of the Faubourg St. Germain, and returned to his historical studies, the fruits of which were *Marie Thérèse* (1888), *Histoire et Diplomatie* (1889), and *Mémoires de Talleyrand* (1891). He left four sons.

Brooks, James, an English architect, born in Hatford, England, March 30, 1825; died in London, Oct. 7, 1901. His early education was obtained at the grammar school at Abingdon, and in 1847 he studied at the Royal Academy schools. He began the practise of architecture a few years later, and in 1860 had become a fellow of the Royal Institute of British Architects, and from 1892 to 1896 was its vice-president. In 1884 he became a member of the Architectural Association. He was appointed architect to the diocese of Canterbury and consulting architect to the Incorporated Society for Building Churches. He was mainly a church architect, and by preference a Gothic church architect, but he treated Gothic after a manner of his own, and was aware that medieval designs could be carried out in brick as well as in stone. He depended for effect on mass and composition rather than on ornament, and his churches are uniformly solid and dignified, with no trace of sham. Among many important churches erected by him may be named St. Michael's, Shoreditch, 1869; Church of the Annunciation, at Chiselhurst, 1870; Holy Innocents, Hammersmith; St. Mary's, Hornsey; All Saints, Southend, Essex; and St. Luke's, Enfield, Middlesex. In 1886 he submitted a design for the proposed Cathedral of Liverpool which exhibited much picturesqueness of treatment in addition to strength and thought in the conception.

Brozik, Vasclav, a Bohemian painter, born in Pilsen in 1851; died in Paris, April 14, 1901. He studied in the Academy of Art at Prague and under Piloty in Munich, went to Paris in 1876, and in 1878 exhibited *The Embassy of Ladislas at the Court of Charles VII of France*, now in the Berlin Museum, which won a gold medal. Most of his canvases are large compositions. Some of the more famous are *The Condemnation of John Huss*, bought by the city of Prague; *Petrarch and Laura at Avignon*; *A Feast in the House of Rubens*; *Christopher Columbus at the Court of Ferdinand and Isabella*, presented to

the Metropolitan Museum of New York by Morris K. Jesup; and Rudolf II of Austria and the Alchemist, in the Stuart collection of the Lenox Library of New York, where also hangs the smaller picture of Grandmother's Birthday.

Brydon, John McKean, a Scottish architect, born in Dunfermline, Scotland, in 1840; died May 28, 1901. He was educated in his native town and began his professional career in Liverpool at the age of sixteen. He soon went to London and became a fellow of the Royal Institute of British Architects in 1881, and a member of the council of the institute many years. His specialty was the designing of public buildings, and at Bath, where he was employed seven or eight years, he built the municipal buildings, the technical schools, the extension of the pump-room, and the Victoria Art Gallery. Important works of his elsewhere are the Southwest London Polytechnic, at Chelsea; Chelsea Vestry Hall; Chelsea Free Library and Victoria Galleries; and the London School of Medicine for Women. In 1898 he was one of eight architects recommended to the Government by the Royal Institute for the new public offices, and to him was assigned the block for the Local Government Board and the Board of Education. Like the late Mr. Young, appointed at the same time to execute the War Office block, he died before completing his work. Brydon's work at Bath is thoroughly in harmony with the older architecture of that city, and better than any one else he understood the Bath phase of English classic.

Buchanan, Robert Williams, English author, born in Caverswall, Staffordshire, England, Aug. 18, 1841; died in London, June 10, 1901. He was the son of a Socialist editor and lecturer,

and obtained his education at the high school in Glasgow and at Glasgow University. In 1860 he went to London with his friend David Gray, the Scottish poet, and the two young men lived in a garret together until Gray presently died of consumption. Buchanan, befriended by Sydney Dobell and Richard Monckton Milnes, soon began to make his way in literature,

attaining in the sixties and early seventies considerable fame as a poet. In 1871 he secured an undeniable notoriety by a savage attack upon Swinburne and Rossetti in the *Contemporary Review*, in an article entitled *The Fleshly School of Poetry*. The paper was not without some excuse, so far as certain of its assumptions were concerned, but its value was much impaired by intemperate language, and it is generally believed that its publication shortened Rossetti's life. Buchanan repented of his harshness in later years and dedicated his romance *God and the Man* to the memory of Rossetti. Buchanan showed singularly little appreciation of the work of his contemporaries, and, although warm-hearted and generous in certain respects, displayed great bitterness in his journalistic writing, and was too much given to violence of expression. His novels are entertaining, though only of ephemeral interest, and he was a clever playwright, but he is seen at his best in his earlier poems, and it is by them that

he will be longest remembered. Exclusive of his plays, his writings include *Undertones* (1863); *Idylls and Legends of Inverburn* (1865); *London Poems* (1866); *Ballad Stories of the Affections*, from the Scandinavian (1866); *The North Coast, and Other Poems* (1867); *Life of Audubon*, edited (1868); *David Gray, and Other Essays* (1868); *The Book of Orm: A Prelude to the Epic* (1870); *Napoleon Fallen: A Lyrical Drama* (1871); *The Land of Lorne* (1871); *The Drama of Kings* (1871); *The Fleshly School of Poetry* (1872); *Saint Abe and his Seven Wives* (1872); *Master Spirits*, a collection of literary studies (1873); *White Rose and Red* (1873); *Poetical Works* (3 vols., 1874); *The Shadow of the Sword: A Romance* (1876); *Balder the Beautiful: A Song of Divine Death* (1877); *A Child of Nature* (1881); *God and the Man* (1881); *Ballads of Love, Life, and Humor* (1882); *The Martyrdom of Madeline* (1882); *Selected Poems* (1882); *Love Me Forever* (1883); *A Poet's Sketch-Book*, selections from his prose (1883); *Annan Water* (1883); *Foxglove Manor* (1884); *The New Abelard* (1884); *Poetical Works* (1884); *The Earthquake, or Six Days and a Sabbath* (1885); *Matt: A Story of a Caravan* (1885); *Stormy Waters* (1885); *The Master of the Mine* (1885); *That Winter Night* (1886); *A Look Round Literature* (1887); *The Heir of Linne* (1887); *The City of Dreams: An Epic Poem* (1888); *The Coming Terror, and Other Essays* (1891); *The Wedding-Ring* (1891); *Come Live with Me and be my Love* (1892); *Rachel Dene* (1894); *Diana's Hunting* (1896); *Effie Hetherington* (1896); *A Marriage by Capture* (1896); *Lady Kilpatrick* (1897); *The Reverend Annabel Lee* (1898); *Andromeda* (1900); *Father Anthony* (1900). *Storm-Beaten*, by Buchanan and Gibson, was published in 1869, and *The Charlatan*, the work of Buchanan and H. Murray, appeared in 1895. The more important of Buchanan's dramas are *The Witchfinder*, *A Nine Days' Queen*, *Lady Clare*, *Alone in London*, *Joseph's Sweetheart*, *A Man's Shadow*, *Dick Sheridan*, and *Sophia*, the last-named an adaptation from Fielding's *Tom Jones*. He gave readings from his poems, and he visited the United States in 1884.

Burr, Mrs. Katherine Douglas (King), an English novelist, died in Rushall, Staffordshire, England, Nov. 27, 1901. She was best known as Katherine King, her marriage to the Rev. Godfrey Burr, vicar of Rushall, having taken place within a year of her death. Her published books include *Petite's Romance* (1870); *Ethel Mildmay's Follies* (1872); *The Queen of the Regiment* (1872); *Lost for Gold* (1873); *Cruel Constaney* (1873); *Off the Roll* (1875); *Our Detachment* (1875); *The Bubble Reputation* (1878); *A Fallen Foe* (1883); *The Law Forbids* (1885); *Sweet is True Love* (1888); *The Scripture Reader of St. Mark's*; *A Bitter Vintage*; *Ursula*; and *Father Hilarion*. The proceeds from several of Mrs. Burr's novels were contributed by her to a hospital for children in the East End of London.

Campoamor, Ramon de, a Spanish poet, born in Navia, Asturias, in 1818; died in Madrid, Feb. 11, 1901. He first intended to enter the Jesuit order, changed his mind and studied medicine in Madrid, was appointed to a political office, and rose to be Governor first of Castellón de la Plana, then of Alicante, and lastly of Valencia. He was attached to the Moderate party, and became in time a pronounced Conservative. In 1862 he elucidated his political opinions in *Polemicas con la Democracia*. His first poetical publication was a collection of idyllic verses, brought out in 1840 under the title of *Ternezas y Flores*, admirable

in technical form. *Ayes del Alma* and *Fábulas Morales y Políticas*, both printed in 1842, sustained his reputation without revealing new powers. In 1853 he completed the epic poem of *Colón*, in 16 cantos. He wrote plays also that were seriously conceived but are deficient in dramatic qualities. He applied himself to philosophical questions, and in *La Filosofía de las Leyes* (1846), *El Personalismo* (1855), *Lo Absoluto* (1865), and *El Idealismo* (1883) he indulged in introspective studies and subjective psychological and emotional revelations that suggested to him the genus of poetical reveries that he called *doloras*, *humoradas*, and *pequeños poemas*.

Carte, Richard d'Oyly, an English operative manager, born in London in 1844; died there, April 3, 1901. He was the son of a maker of musical instruments. He left London University without completing his course in order to enter his father's business, composed songs and theatrical pieces, started a concert agency, and about 1870 began to devote himself to the development and encouragement of an English school of comic opera, founding the Savoy Theater for the production of the pieces of Gilbert and Sullivan. When the composer and librettist quarreled he tried the music of Sir A. C. Mackenzie, Ernest Ford, and M. Messenger without much success, and when he founded an English opera-house for serious music he met with failure.

Carter, Thomas Thellusson, an English divine, born in Eton in 1808; died in Clewer, Oct. 28, 1901. He was educated at Eton, where his father was vice-provost of the college, and at Christ Church, Oxford, graduating in 1830 with a first-class in humane letters, was ordained in 1832, and after holding two curacies, and from 1837 till 1844 the rectorship of Puddle-Hinton, in Dorsetshire, became rector of Clewer. From his Oxford days he was a zealous controversialist among the Tractarians who reclaimed for the English Church the Catholic character it lost at the Reformation and sought to restore the teachings and practises of the Fathers of the Church. From 1860 till 1899 he published a continuous series of works dealing with sacramental teaching, sisterhoods and their devotions, night offices, and the lives of Anglican devotees. He was one of the leaders of the ritualists in the controversy with the bishops and the subsequent litigation. With Lord Halifax he proposed in 1877 a concordat with the bishops which they regarded as a demand for their surrender. In 1880 Canon Carter was charged by one of his parishioners with illegal ritualistic practises, first before the Bishop of Oxford, Dr. Mackarness, who for the peace of the parish refused to grant a commission under the church discipline act; then the accuser, Dr. Julius, applied to the courts for a mandamus, which was issued in spite of the objections of the bishop, but the right of the bishop to forbid the prosecution was sustained on appeal, and the House of Lords confirmed it, a decision which stopped the prosecution of ritualists in the courts. Dr. Carter, however, thought it best to resign his benefice, retaining the wardenship of the House of Mercy at Clewer.

Cates, Arthur, an English architect, born in London, April 29, 1829; died there, May 15, 1901. He was educated at King's College School, London, and became an associate of the Royal Institute of British Architects in 1856 and a fellow in 1874. In 1870 he was made architect to the Land Revenues of the Crown, and, beside being surveyor to the Honorable Society of the Inner Temple, he held other appointments. He was honorary secretary to the Architectural Publi-

cation Society, which issued the Dictionary of Architecture, and he founded the Arthur Cates prizes for students admitted to the final examination.

Cazin, Jean Charles, a French painter, born in Samer, Pas-de-Calais, in 1841; died March 29, 1901. He was the son of a physician of Boulogne, and began his artistic work as a decorator of pottery. He studied painting with Léon de Boisbaudran, became Professor of Drawing in the special school of architecture founded by Émile Trélat in 1865, and director in 1869 of the fine-art school in Tours. When the war was over in 1871 he went to London as Professor of Drawing at South Kensington. He sent to the Salon from London his *Chantier*, which was followed after his return to Paris in 1876 by *La Fuite en Égypte*, the *Voyage de Tobie*, and *Le Départ*, three works that by refined simplicity of composition and decorative beauty made a sensation. In the Salon of 1880 his *Agar et Ismaël* won the first medal and was purchased by the state for the Luxembourg. His *Judith sortant de Béthulie*, exhibited in 1883, was criticized by many, but found more admirers when it was hung in the French centennial exposition. After that Cazin devoted himself to landscape, and his latest compositions show in their hasty execution the pressure of orders. His best works show an original and sincere master, a natural colorist of refined and cultivated mind.

Chisholm, Henry William, an English statistician, born in London, July 29, 1809; died there, Jan. 16, 1901. He was the son of a Government clerk, was educated for the civil service, and entered the Exchequer in 1824, became assistant and in 1842 successor to Beaumont Smith, chief of the bill department, who forged exchequer bills to the amount of £400,000. In 1859, on completing a statistical paper on the origin and progress of the national debt of Great Britain, he set to work on a great account of the national income and expenditure since 1688, which was completed in 1869, and after his retirement was continued down to the present time. He was chief clerk of the Exchequer when the old office of the Exchequer was abolished in 1865, and after the standards act was passed in 1867 was made warden of the standards, an office created for him and abolished when he retired in 1877. On his recommendation the trial of the pyx was continued. He was British delegate to the International Metric Commission in Paris in 1870 and 1872, and the diplomatic conference of 1875. He published a book on Weighing and Measuring.

Christie, Richard Copley, an English scholar, born in Lenton, England, July 22, 1830; died in Ribsden, Jan. 9, 1901. He took his degree at Oxford, and, settling in Manchester, engaged in educational work and held the chairs of History, Political Economy, and Jurisprudence in the newly established Owens College, in 1854-'69. He had been called to the bar from Lincoln's Inn, and in addition to his college duties he practised his profession in 1857-'77. From 1872 to 1894 he was chancellor of the diocese of Manchester. After his retirement from his profession in 1877 he gave a large part of his time to bibliographical researches, editing important bibliographical works and contributing to reviews and to the Dictionary of National Biography. The careful sketch of Mark Pattison in that publication is by him. In 1880 he published *Étienne Dolet, the Martyr of the Renaissance* (revised ed., 1899). He was a constant benefactor to Owens College, the beautiful Christie Library, designed by Waterhouse and completed in 1898, being his gift. His library,

containing 75,000 volumes, rich in Aldines, editions of Horace, and specimens of Renaissance literature, was bequeathed to the college.

Chrysander, Franz Karl Friedrich, a German musical scholar, born in Lüththeen, Mecklenburg, July 8, 1826; died in Bergedorf, Sept. 3, 1901. He was educated at the University of Rostock, and after a residence of some years in England returned to Germany and made his home in Bergedorf. He was the chief Handelian scholar of his time, and will be longest remembered for his biography of Handel, the first volume of which was issued in 1858, the second in 1860, and the first part of the third in 1867. Chrysander edited all the works of Handel for the *Handel Gesellschaft*, and editions of Bach's clavier works, and of several of Carissimi's oratorios. He also published *Über die Moll-Tonart in Volksgesängen und Über das Oratorium* (1853).

Commerell, Sir John Edmund, an English naval officer, born in Horsham, Jan. 13, 1829; died in London, May 21, 1901. Entering the navy at the age of thirteen, he served in China. He attained a lieutenancy in 1848, commanded a gunboat in the Crimean War, and won the Victoria Cross for landing with two seamen on the shore of the Sea of Azof and destroying a great store of grain. In 1859 he commanded a vessel in the China seas and distinguished himself in a brave and unsuccessful land attack on the Taku forts, for which he was made a captain. In command of the *Terrible*, he assisted in laying the Atlantic cable in 1866, and was selected in 1869 to try the turret-ship *Monarch*. In 1871 he was commodore and commander-in-chief on the west coast of Africa, which he had to leave in 1873, having received a dangerous bullet wound while reconnoitering the position of the *Ashantis* on the *Prah* river. In 1877 he was second in command in the Mediterranean, with the rank of rear-admiral. As vice-admiral he commanded on the North American and West Indian station from 1882 till 1885, then returned to England and sat in Parliament for Southampton and endeavored to impress on the public and legislators the needs of the navy. He resigned his seat in 1888 on being appointed commander-in-chief at Portsmouth, having been made admiral in 1886. After the death of Sir Provo Wallis, in 1892, he was, at the Queen's desire, promoted over the heads of one or more senior admirals to be Admiral of the Fleet, and in 1899 he was retired.

Coronini, Count Franz, an Austrian politician, born in Görz in 1833; died there in August, 1901. His father, Gen. Coronini, was the preceptor of Franz Josef, and he himself and Count Taaffe were youthful companions of the future Emperor. Entering the army, he served in the campaigns of 1859 and 1866, and retired in 1867 with the rank of lieutenant-colonel. The electors of his native place then sent him to the provincial diet and next to the Austrian Reichsrath, where he sat with the Constitutional party, but showed extremely moderate tendencies and leanings toward the Government, and even toward clericalism. In 1878 he broke away from the Germans when they opposed the expedition to Bosnia and Herzegovina. When Count Taaffe succeeded in 1879 in inducing the Czechs to re-enter the Reichstag, Count Coronini was elected president, and retained the office until the attacks of the German Liberal press drove him in 1881 to give up his place to Herr Smolka. Having been reelected a Deputy, he attempted to form a Left Center group which should act with the Constitutional majority. The Coronini Club was composed mainly of Italian members from

the coast land, and till it broke up, in 1895, it held the balance between Conservative principles and Constitutional ideas, and often had a decisive influence. When Count Coronini, in the debate that brought about the fall of the Windischgrätz ministry, supported the Slovenes in their demand for a gymnasium, his Italian followers deserted him and voted with the Germans.

Creighton, Mandell, an English historian, born in Carlisle, England, July 5, 1843; died in Fulham, England, Jan. 14, 1901. He was educated at Oxford, and was a fellow and tutor there in 1867-'75. After being ordained priest in the Church of England in 1875, he was vicar of Embleton, Northumberland, 1875-'84, and for the last seven years of this period was also rural Dean of Alnwick. From 1885 to 1891 he was canon residentiary of Worcester cathedral, holding the post of Dixie Professor of Ecclesiastical History at Cambridge University for the same time. He was also Hulsean lecturer at that university in 1893 and Rede lecturer in 1895. At Oxford he was select preacher to the university for eight years, and was Romanes lecturer in 1896. As a fellowship at Emmanuel College was attached to his professorship at Cambridge, he represented that college at the two hundred and fiftieth anniversary of Harvard University in 1886. In 1896 he represented the English Church at the coronation of the Emperor of Russia. In 1891 he was consecrated Bishop of Peterborough, and on Nov. 1, 1896, was translated to the see of London. At the moment of his promotion to this see, some of the clergy within the diocese had become conspicuous for their extravagances of ritual, but Bishop Creighton, through the exercise of moderation and firmness, was presently able to restore order. He held that the Church rested on an appeal to sound learning, and, while willing to allow all reasonable latitude, he insisted upon "a recognizable type" of service, and that no doctrine should be taught exhibiting a tendency toward either Roman Catholicism or medievalism, or in any way contrary to the distinguishing features of the English Church. As a writer, Bishop Creighton will be longest remembered by his *History of the Papacy*, the literary charm of which is very marked. It exhibits perfect comprehension of the subject, completeness of detail, and a clear style. It is not lacking in touches of humor, or passages of even brilliant narration, but accuracy is never sacrificed to picturesque effect. The bishop was a man of wide culture, but, like many another brilliant scholar, sometimes displayed traces of intellectual intolerance, and the playful humor that he did not always repress perplexed extremely literal persons. His published writings include *A Primer of Roman History* (1875); *The Age of Elizabeth* (1876); *The Life of Simon de Montfort* (1876); *The Tudors and the Reformation* (1877); *A History of the Papacy during the Period of the Reformation* (1882-'94); *Cardinal Wolsey* (1888); *Carlisle, in the Historic Towns series* (1889); *Persecution and Tolerance* (1895); *The Early Renaissance in England* (1895); *Queen Elizabeth* (1896); *The English National Character* (1896); *The Heritage of the Spirit, and Other Sermons* (1896); *Church and State* (1897); *The Story of some English Shires, a work of much importance* (1897); *Lessons from the Cross* (1898).

Crispi, Francesco, an Italian statesman, born in Ribera, Sicily, Oct. 4, 1819; died in Naples, Aug. 11, 1901. His family, of Albanian and Greek descent, had formerly been prominent in the landholding aristocracy of Sicily. His father was an advocate and mayor of Ribera. His uncle, a

bishop, undertook to educate the boy, and in the monastery and seminary of Monreale brought him up to be a priest. Young Crispi chose rather to be a lawyer, studied in the University of Palermo, took his degree at the age of eighteen, continued his studies in preparation for entering the

magistracy, but married rashly a beautiful girl, and, having offended the procurator-general by disputing with him the theory of taxation, opened an office as advocate and made a forensic reputation at once by saving a brigand from the gallows. He removed to Naples, his young wife and her child having both died, and his legal career

was wrecked by the interest he took in the revolutionary movement of Young Italy which was stirred into a blaze in the two Sicilies by the repressive violence of the bigot Ferdinand II. The suicide of his friend Arcto, whom he celebrated in a touching political sonnet, and the execution of the Bandiera brothers in 1844 helped to make Crispi, not without a mental conflict between revolutionary ideas and the priestly training of his youth, a champion of Italian unity and a Republican, for he was not yet won over to the leadership of Piedmont. He first joined Poerio's revolutionary society, an open body with secret political aims, in 1843, and when insurrections broke out in different parts of the peninsula in 1846 he alone of the leading members escaped arrest, and thus became the chief organizer and director of the revolutionary propaganda. He reached Palermo on the day after its seizure by the insurgents on Jan. 12, 1848, and for the next year he was one of the heads of the revolutionary Government, and as Secretary of War organized the Sicilian army. He founded a newspaper to advocate his ideas, and in the Chamber of Commons he advanced a policy in which Sicilians were generally in agreement—administrative independence of Sicily in a confederation of the Italian peoples. The victory of the Austrians at Novara, the successes of the Bourbon troops, and the widening chasm between the Moderates and the Radicals and Republicans impelled the Moderates, who were in the majority, to vote in the Sicilian Chambers, in April, 1849, to accept the mediation of France and England. Crispi abstained from voting, but he was excluded by name from the amnesty, and fled to Turin, where he wrote with Depretis and other ardent advocates of Italian unity for the *Progresso* newspaper until Piedmont itself was closed to him in consequence of the outbreak at Milan in 1853. He stayed a short time in Malta. In London, his next refuge, he came in contact with Mazzini. After a year of starvation he went to Paris, where he remained until the police expelled him in consequence of Orsini's attempt in 1858 on Napoleon III. The peace of Villafranca, forced upon Sardinia, provoked insurrections in Parma, Modena, and Tuscany in favor of annexation to Piedmont and brought back exiled leaders who entered Tuscany and Emilia secretly to take charge of the movement. Crispi, disguised

as a gray-bearded Argentine merchant, with a pass procured by Mazzini, landed in Messina, and went through Sicily organizing bands of patriots, teaching them to make bombs, and promising to return to head the rising on Oct. 4, 1859. His friends lost heart as soon as he turned his back, and, going first to London to provide himself with another disguise and a new forged passport, he traveled all over Italy seeking assistance for the deliverance of his native Sicily from the yoke of the Bourbons. In Modena, Farini promised him 1,000,000 francs, and in Turin he won over Ratazzi, the Prime Minister. He went with his friend Pilo to Genoa to appeal to Garibaldi to reassemble the disbanded volunteers who were menacing the papal states and lead an expedition to Sicily. When Garibaldi made a Sicilian rising the condition, Pilo undertook to get up a sufficient movement. If the King of Sardinia and Cavour knew what was going on, they shut their eyes. On May 5, 1860, Garibaldi sailed with his thousand men from Quarto to invade Sicily and defy an army of 36,000 regulars and a fleet of 24 frigates. He almost drew back at the last moment, but Crispi's confidence gave him hope. Landing on May 11, Garibaldi's legion won the fight at Calatafimi four days, and on May 27 the revolutionists were masters of Palermo. Garibaldi crossed over to Naples, and on Oct. 1, with the watchword of Italy and Victor Emanuel, he defeated the Bourbon army at Voltorno. Garibaldi had taken the head of the provisional Government and named Crispi his Secretary of State on May 17. Crispi had accepted the monarchy because that would unite, while the republic would divide Italy. Garibaldi always acknowledged that the winning of the Sicilies and the final union of the Italian lands into one kingdom was due in a greater degree to the untiring energy and fiery zeal of Francesco Crispi than to his own action. He steadfastly refused to part from him, although suspicion and calumny reached his ear from all sides. La Farina, who was Cavour's representative in Sicily, was unwilling to yield the fruits of victory to another, although he himself had shrunk from the fight. Cavour could not be induced to countenance a Red Republican, the emissary of Mazzini. Garibaldi made Crispi Minister of the Interior and Finance, and in this office he developed an astonishing degree of energy and organizing talent; yet, when Victor Emanuel entered Naples, he had to go, and he surrendered his office without an effort to assert his claims and merits. In February, 1861, he entered the Italian Parliament at Turin and took his seat with the Extreme Left. As a Sicilian among Piedmontese bureaucrats, shunned by the Republicans as a turncoat and suspected by the Ministerialists as a Mazzinist, his position was a lonely one, and he neither claimed nor was claimed by any party. He attacked the Prime Ministers, Ratazzi in 1862 and Minghetti in 1863, accused the Government in 1864 of procuring the plot against Napoleon III of which Mazzini was accused, was denounced in 1865 by Mazzini as a renegade, in reply to which he avowed his sincere conversion to the monarchy, was defeated as the candidate of the Left for the presidency of the Chamber in 1866, and in 1867 became the acknowledged leader of the party. His means of living came from his profession, and when the seat of Government was transferred to Florence in 1865 and to Rome in 1870 he had to build up a new practise in each place. When the Left came into power in 1876 Depretis was called upon to form a ministry, and Crispi was chosen president of the Chamber.

In December, 1877, he entered the Cabinet as Minister of the Interior in succession to Nicotera. Crispi, the most masterful, impetuous, energetic, and eloquent of Italian politicians, the greatest organizer and administrator, born to act and to command, had waited until others were passing from the scene before reaching a position in which his talents and his authority could be displayed. But this day was even yet not come. He was soon driven from office by a scandal started by a Neapolitan whom he had dismissed from a post in the Ministry of the Interior. In the days of his revolutionary activity he had gone through a form of marriage in Malta with Rosalie Montmasson, with whom he lived nearly twenty years, then separated from her, making her a satisfactory allowance. The marriage was not in legal form, and in January, 1878, he married the widow Lina Barbagallo, of Syracuse. His enemies accused him of bigamy and brought him before the Neapolitan court. Although acquitted on the criminal charge, his moral reputation suffered to such a degree that his political prestige and influence seemed forever shattered. In March he resigned his office. In a short time he regained his power in the Chamber. He joined the pentarchy in 1883, a combination of groups which lost control as the result of the election of 1886. The defeat of the Italian expedition into Abyssinia, at Dogali, in January, 1887, led to a reconstitution of the Depretis Cabinet. Crispi became Minister of the Interior and Zanardelli Minister of Justice. When Depretis died in July the voice of the people designated Crispi as his successor. He represented in Italy the idea of a democratic monarchy and he represented the south. His coming to power at the age of sixty-eight signified therefore the triumph of democracy over monarchical and aristocratic traditions and the shifting of the political center of gravity from Piedmont to Sicily. King Humbert with reluctance commissioned him to form a ministry, which was completed on Aug. 7, 1887. He took the portfolio of Foreign Affairs. The triple alliance, into which Italy had entered after the French occupation of Tunis in 1881, was in danger owing to the menaces of France and the vacillating mood of Italian opinion. Crispi took a bold stand where Depretis had been weak. He visited Bismarck at Friedrichsruhe to signify to the world Italy's adhesion to the alliance. He denounced the commercial treaty with France instead of waiting for French action. He made overtures with England for a Mediterranean naval understanding or alliance. Even in Abyssinia he gained a triumph in the treaty of Ucciali signed in May, 1889. The mightiest man in Italy since Cavour, he seemed to have given vigor and power to the kingdom and did impart a prestige among nations that it never possessed before. The tariff war with France had unfortunate economical consequences, and foreign prestige imposed financial burdens. The deficits of the treasury grew enormous, yet Crispi would not listen to proposals for reducing the national armaments. In 1891 he had to give way to a Government of the Right under the Marquis Rudini, who was succeeded in the following year by Giolitti with a coalition Cabinet. Neither of them accomplished any financial reforms, reduction of armaments, or changes in foreign and colonial policy. The triple alliance was renewed on terms which Crispi called unfavorable to Italy. The financial and economic situation grew worse, and finally came the crash of 1893, revealing bank scandals. Giolitti had to withdraw under a cloud, and Crispi returned to power in November, 1893.

He put down the disturbances in Sicily with an iron hand, and dissolved Socialist associations, incurring the enmity of the Socialists and Radicals, who brought accusations involving him in the bank scandals. He could not rebut the charges of having shielded forgers and embezzlers and countenanced the use of the bank funds for electoral purposes, if not for his private benefit. To hush up the scandal he suddenly dissolved Parliament at the end of 1894 and ordered the prosecution of Giolitti, who had given form to the charges by revealing official secrets. Crispi's former foes were those on whom he now relied. He even offered the hand of friendship to the Church, declaring religion to be a conservative force which should act with the civil authority. The elections of 1895 gave him once more a great majority in the Chamber, but Radicals and Conservatives united in bitter personal attacks, against which he still had force to resist. The Adowa disaster brought about his downfall. It was the strangest fortuity of his career that he had to bear, nor did he attempt in the least to escape the full responsibility for the Abyssinian adventures against which he had been the foremost to warn the country. He resigned on March 5, 1896. A parliamentary investigation resulted in 1898 in exonerating him from the charges that were made against his personal integrity, but not of financial irregularities committed for party purposes. Although it was a matter of common knowledge that many Italian ministers are equally blameworthy with himself on this score, he immediately resigned his seat in the Chamber. Palermo re-elected him with an overwhelming majority.

Cutts, Edward Lewes, an English author, born in 1824; died in London, Sept. 3, 1901. After receiving a university training he took orders in the English Church in 1848, and was successively curate at Coggeshall and Billericay, in Essex. He served as secretary of the Additional Curates Society in 1865-'71, and from the last-named year until his death was vicar of Holy Trinity parish, Haverstock Hill. His writings include *A Manual of Sepulchral Slabs and Crosses* (1849); *Colchester Castle not a Roman Temple* (1853); *Essay on Church Furniture and Decoration* (1855); *Essay on Christmas Decoration of Churches* (1859); *Home Missions and Church Extension* (1861); *The Villa of Claudine: A Tale* (1861); *Scenes and Characters of the Middle Ages* (1872); *The First Rector of Burgstead: A Tale* (1874); *Turning-points of English History* (1874); *Some Chief Truths of Religion* (1875); *Pastoral Counsels* (1876); *Christians under the Crescent in Asia* (1877); *Saint Jerome* (1879); *Saint Augustine* (1881); *The Breaking of the Bread: An Explanation of the Holy Communion* (1881); *Constantine the Great* (1881); *Charlemagne* (1882); *A Devotional Life of Christ* (1882); *Addresses to Candidates for Confirmation* (1882); *Perfecting Holiness* (1883); *A Dictionary of the Church of England* (1887); *Colchester, in Historic Towns Series* (1888); *Saint Cedd's Cross: A Tale* (1890); *A Handy Book of the Church of England* (1892); *History of Early Christian Art* (1892); *Augustine of Canterbury* (1895); *Parish Priests and their People in the Middle Ages* (1898).

Dawson, George Mercer, a Canadian geologist, born in Pictou, Nova Scotia, Aug. 1, 1849; died in Ottawa, March 2, 1901. He was a son of Sir John William Dawson, the naturalist, was educated at McGill University, Montreal, and the Royal School of Mines, London, graduating in 1872 at the head of his class. On returning to Canada he made mining surveys in Nova Scotia; lectured at Morrin College, Quebec, and in 1873

was appointed geologist and botanist to the North American Boundary Commission charged with the survey of the United States boundary from the Lake of the Woods to the Rocky mountains. At the end of his labors, lasting two years, he prepared a report, with maps and plates, on the geology and natural resources of the region along the forty-ninth parallel, and in connection with this he prepared a report on the tertiary lignite formation, a memoir on the superficial deposits of the great interior plains of America, and papers on locust visitations, on the fresh-water sponges of Canada, and on the fluctuations of the Great Lakes. In 1875 he was appointed to the staff of the Geological Survey of Canada, of which he became assistant director in 1883 and director in 1895. He explored a great part of British Columbia, and made long trips in the Northwestern Territory, on one of them going by boat 1,300 miles up the Liard and down the Yukon rivers. As one of the Bering Sea Commissioners he spent the summer of 1892 in studying seal life, and on his report was based the British case. Besides his official reports he published many papers on geological, geographical, and ethnological subjects.

Dickson, Sir James Robert, an Australian statesman, born in Plymouth in 1832; died Jan. 9, 1901. He was educated in Glasgow, emigrated to Victoria in 1854, established himself in business, conducted a mortgage bank in Queensland, engaged in politics, entering the Queensland Parliament in 1873, in which he represented Ennangora for some years, was minister in several Cabinets, holding the portfolio of Public Works in 1876, was Treasurer till 1879, and again from 1883 to 1887. He became Premier and Chief Secretary in 1898, and remained for fourteen months at the head of the Government. He was an active participant in the movement for federation, and in 1900 he went to London as Delegate for Queensland to assist in procuring the passage of the Australian federation act by the Imperial Parliament. He received the portfolio of Defense in the first Federal Cabinet. His knighthood dates from 1898.

Dickson, William Purdie, a Scottish clergyman, born in Pettinam Manse, Lanarkshire, Oct. 22, 1823; died in March, 1901. He was graduated at the University of St. Andrews in 1851, and was minister of Cameron, Fifeshire, in 1851-'63. He was Professor of Biblical Criticism at Glasgow University in 1863-'73, and of Divinity in 1873-'95, and had been emeritus professor from 1895. He was also curator of the university library in 1866-'97. He published a translation of Mommson's History of Rome (1862-'67); Mommson's Roman Provinces (1887); and St. Paul's Use of the Terms "Flesh and Spirit" (1884).

Dompierre d'Hornoy, Admiral, a French naval officer, born in 1816; died March 21, 1901. He took part in African campaigns, the bombardment of Sebastopol, and in the expedition to Mexico. During the siege of Paris, having the rank of vice-admiral, he was a delegate of the Ministry of Marine, and in 1873 he became minister himself in the Broglie Cabinet, and kept the place till May 22, 1874. In 1871 he was elected to the National Assembly from the Somme, and sat with the Legitimist Right. From 1877 to 1881 he was a Senator, and from 1885 to 1889 a Deputy.

Drayson, Alfred Wilks, an English soldier and astronomer, born April 17, 1827; died in Portsmouth, England, Sept. 27, 1901. He received his first commission in the English army in 1846,

and in 1882 he retired, receiving the honorary rank of major-general the next year. During this period he served in Africa, India, and Canada, and was for many years Professor of Astronomy in the Royal Military Academy at Woolwich. Some time since he propounded the theory of the earth having a second rotation, and the reasons for his belief are set forth in a pamphlet entitled *The History of an Astronomical Discovery* (1901). He wrote books of adventure, and his books upon military topics have met with general acceptance. He was an enthusiastic naturalist, and, although a keen sportsman, had the greatest dislike to useless slaughter. His *Art of Practical Whist* is recognized as a standard work. His published writings include *Description of the Patent Elongating Tunnel Telegraph Cable*, with C. R. Binney (1858); *Sporting Scenes among the Kaffirs of South Africa* (1858); *Great Britain has been and will be again within the Tropics* (1859); *The Earth we Inhabit: Its Past, Present, and Probable Future* (1859); *The Common Lights in the Heavens and How to See and Know Them* (1862); *Practical Military Surveying and Sketching* (1862); *Tales at the Outspan* (1862); *Adventures of Hans Stork, the South African Hunter and Pioneer* (1868; new ed., entitled *Among the Zulus*, 1879); *The Young Dragoon* (1870); *On the Cause, Date, and Duration of the Last Glacial Epoch of Geology and the Probable Antiquity of Man* (1873); *The Cause of the Supposed Proper Motion of the Fixed Stars* (1874); *The Gentleman Cadet: A Tale* (1874); *The Art of Practical Whist* (1879); *Experiences of a Woolwich Professor at the Royal Military Academy* (1886); *The White Chief of the Caffres* (1886); *From Keeper to Captain* (1888); *Thirty Thousand Years of the Earth's History* (1888); *The Diamond Hunters of South Africa* (1889); *Untrodden Ground in Astronomy and Geology* (1890); *Whist Laws and Whist Decisions* (1890); *Intellectual Whist* (1899); *The History of an Astronomical Discovery* (1901).

Duthiers, Baron Henri de Lacaze, a French naturalist, born in 1821; died in Las Fous, Périgord, July 22, 1901. He studied medicine in Paris, became Professor of Zoology at Lille in 1854, was sent on a scientific mission to the Mediterranean in 1862, and on his return published his book *Le Corail*, which gave him a world-wide reputation. He was appointed Professor of Natural History at the Museum in Paris in 1865, and obtained a chair at the Sorbonne in 1868. In 1871 he succeeded M. Longuet at the Academy of Sciences. He was instrumental in founding marine laboratories at Roscoff and Banyuls.

Elliot, Sir George, an English naval officer, born in 1813; died in London, Dec. 13, 1901. He was the eldest son of Admiral Sir George Elliot, and entered the navy in 1827. In 1834 he was promoted to the rank of lieutenant, and he rose through successive promotions to be rear-admiral in 1858, vice-admiral in 1865, and admiral in 1870. From 1874 to 1877 he was commander-in-chief at Portsmouth, receiving the order of K. C. B. in 1877, and retiring from the service in the following year. In 1885 Admiral Elliot published a valuable Treatise on Future Naval Battles, and How to Fight Them.

Ellis, Mrs. Annie (Raine), an English author, born in Durham, England, in 1828; died Sept. 2, 1901. She was the daughter of James Raine, of Durham, a noted antiquary, and an elder sister of Canon Raine, of York, and of Mrs. Alfred Hunt, the novelist. She received a good classical education and passed much of her life in an antiquarian atmosphere. Beside edit-

ing reprints of Evelina and Cecilia, with notes, and also editing Miss Burney's Early Diaries, Mrs. Ellis wrote *Marie, or Glimpses of Life in France* (1879); *Sylvestra: Studies of Manners in England from 1770 to 1880* (1880); and *Mariette* (1884).

Errazuriz, Federico, President of Chile, born in Santiago in 1850; died in July, 1901. He was educated as a lawyer with a view to political life. Inheriting a large estate, he gave much study to improvements in agriculture. He sat in Congress as a Deputy from 1876 till 1889, when he was elected Senator for the Province of Maule. Under President Balmaceda he was appointed Minister of War, and displayed tact as well as energy in that office. In 1891 he joined the revolutionists, and when the congressional party finally won he was foremost in advocating a general amnesty. He was elected President in June, 1896.

Eyre, Edward John, an English administrator, born in Yorkshire in August, 1815; died in Tavistock, Dec. 21, 1901. He was the son of a clergyman and was educated for the army, but on failing to get a commission emigrated to Australia in 1833 and engaged in raising cattle and sheep. He acquired an estate on Murray river, became an advocate of the rights of the natives, and distinguished himself by explorations which he described in *Discoveries in Central Australia* (1845). He was then appointed Lieutenant-Governor of New Zealand, and in 1853 of St. Vincent, and in 1856 was transferred to Antigua, where he acted for two years as Governor of the Leeward Islands. He returned to England with impaired health, but was sent out in 1862 to act as Governor of Jamaica in the absence of Sir Charles Darling, and in 1864 was appointed Governor. The island was passing through evil days, the civil war in the United States having made food dear. The Governor quarreled with the Legislature, in which the negro element was in the ascendancy, and the colored population attributed their sufferings to the oppression of the whites. On Oct. 11, 1865, a serious riot occurred at Morant Bay. Negroes killed the magistrates of the parish and many volunteer soldiers and civilians who came to their assistance, and then proceeded inland, committing robberies and atrocities. Gov. Eyre proclaimed martial law in the eastern county where these events occurred, and in a few days the troops had checked the insurrection. George William Gordon, a negro member of the Legislative Assembly, was arrested in Kingston, where martial law was not in force, as an instigator of sedition, and was taken to Morant Bay, tried by court-martial, and summarily executed, and the same punishment was meted out to 354 persons in the disturbed district, while 85 were shot down without trial, 600 were flogged, and 1,000 houses were burned. The levity and ferocity displayed in these proceedings shocked public opinion in all civilized countries. Commissioners were sent from England, who found that the majority of the persons tried were condemned without a semblance of evidence. In England, John Stuart Mill took the lead of an agitation for the trial of Gov. Eyre as a murderer. Thomas Carlyle wrote in his defense and extolled him as a hero who with British resolution and intrepidity had rescued a British colony from massacre and the horrors of a negro rebellion. The Government recalled Gov. Eyre, appointing as his successor Sir Henry K. Storks, chairman of the royal commission that had pronounced the punishments excessive, the continuance of martial law unnecessary, the hangings unnecessarily frequent, the floggings reckless and barbarous, and

the burning of houses wanton and cruel. John Stuart Mill's Jamaica committee raised funds to prosecute Eyre and his subordinates. Complaints and trials took place, but neither Eyre nor Gen. Nelson, who commanded the troops in Jamaica, nor Lieut. Brand, who presided at the courts-martial, could be convicted. Mr. Eyre retired on a pension.

Faber du Faur, Otto, a German painter, born in Ludwigsburg in 1828; died in Munich in August, 1901. He was the son of a Württemberg general who was a good painter of battle scenes, and he too attempted to combine art with a military career, but gave up the latter, and in 1867 resigned his commission and began the serious study of art at Munich with Kotzebue, at Paris with Yvon, and at Munich again with Piloty. He became one of the strongest battle painters in Germany. He began with historical pictures in Piloty's manner, such as the Departure of the Elector Frederick V from Prague, but soon quitted this field and devoted himself to depicting battles of the Napoleonic wars in which his father had borne a part. The Retreat from Moscow furnished him with numerous subjects. His aquarelle representing the Passage of the Beresina is in the Luxembourg gallery in Paris. The war of 1870 gave him material for some of his best paintings, among which are the Battle of Champigny, the Panorama of the Battle of Wörth (McMahon's defeat, Aug. 6), now in Hamburg, and the Ambulance behind a Barricade.

Farmer, John, English organist and composer, born in Nottingham, England, Aug. 16, 1835; died in Oxford, July 17, 1901. After pursuing his education at Nottingham, Leipzig, and Coblenz, he taught music in Zurich in 1856-'61. He was organist at Harrow School from 1882 until 1885, when he was appointed organist of Balliol College, Oxford, a post which he retained at the time of his death. His work was thorough and scholarly. He published Harrow School Songs; Christ and his Soldiers, an oratorio for children (1878); Cinderella, a fairy opera for children (1882); Requiem, for departed Harrow scholars; Gaudeamus, songs for schools and colleges (1890); Dulce Domum, songs and rhymes for children; and Songs for Soldiers and Sailors.

Fick, Adolf, a German physiologist, born in Cassel in 1829; died in Blankenberge, Aug. 21, 1901. He obtained his doctor's degree at Zurich in 1852, became Professor of Physiology there in 1856, and left that university in 1868 to take the same chair at Würzburg, retiring in 1901. He was the author of many works. His treatise on medical physics appeared in 1857, a compendium of physiology in 1860, a work on the anatomy and physiology of the organs of sense in 1862, one on mechanical work of muscular action and the production of heat in 1882, and books on cause and effect and the theory of probabilities in that and the following year.

Fitzgerald, George Francis, an Irish scientist, born in Dublin in 1851; died there, Feb. 21, 1901. He was the son of Dr. Fitzgerald, Anglican Bishop of Cork, and was educated at Trinity College, Dublin, where he won scholarships in mathematics and experimental science and in 1877 a fellowship, and in 1881 became Professor of Natural Philosophy. Besides his contributions to the progress of physical science, he gave practical aid to Irish industry by his suggestions on applied science, and took a great interest in the reform of university education, in the higher education of women, in the proposal for a Roman Catholic university, and in Irish education in general.

Foa, Édouard, a French explorer, died in Paris in June, 1901, at the age of thirty-eight. He was decorated by the French Government for his journey across Central Africa, and received the grand gold medal of the French Geographical Society. He was the author of two volumes, *Mes Grandes Chasses dans l'Afrique Centrale* and *Du Cap au Lac Nyassa*, for which the French Academy awarded him a prize of 1,500 francs.

Ford, Edward Onslow, an English sculptor, born in London July 27, 1852; died there, Dec. 23, 1901. He studied at Antwerp and Munich, and after a few years became a regular exhibitor

at the Royal Academy. His earliest work to attract general attention was a seated statue of Sir Henry Irving as Hamlet, now in the London Guildhall Gallery. Other important works of his are a standing statue of Gladstone, seated statues of Huxley, Dr. Dale, and the Duke of Norfolk, the Shelley Memorial, the Jowett Memorial, the Marlowe Memorial at Canterbury, the Strathnairn monument in

Knightsbridge, and the great statue of Queen Victoria for the city of Manchester. Besides these, Ford executed many portrait busts and imaginative designs. His figures are infused with the perception of beauty of line or expression, rather than with great originality or power.

Fuller, Morris Joseph, an English clergyman, born at Lewes, Sussex, about 1835; died in Brighton, July 25, 1901. After receiving an education at Brighton College and at Cambridge, he was an assistant master at the former institution in 1855-'60. He took orders in the English Church in 1857, and for a time was curate of Buckland Monachorum, Devonshire. He was rector of Lydford, 1867-'79; vicar of East Moulsey, 1879-'84; rector of Ryburgh, 1884-'89; vicar of Bishops Tawton, 1889-'93; and vicar of St. Mark's, Marylebone Road, London, 1893-1901. He was an extreme ritualist and a very ardent controversialist, and in consequence was continually involved in ecclesiastical disputes. He published *The Court of Final Appeal*, or the Appellate Jurisdiction of the Crown in Ecclesiastical Cases (1865); *Our Established Church* (1878); *The Lord's Day: Its Unity, Philosophy, and Perpetual Obligations* (1883); *Life, Times, and Writings of Thomas Fuller, the Church Historian* (1884); *Letters on the Disestablishment Question* (1885); *Our Lady of Walsingham* (1886); *The Throne of Canterbury, or the Archbishop's Jurisdiction* (1891); and *Life, Letters, and Writings of John Davenant, 1621-1641, Lord Bishop of Salisbury* (1897).

Gilbert, Sir Henry, an English agricultural chemist, born in Hull, in 1817; died in St. Albans, Nov. 23, 1901. He was the son of a clergyman, studied chemistry at Glasgow and London Universities, and under Liebig at Giessen, and after assisting in the laboratory of University College, London, took charge in 1843 of the chemical laboratory of the experimental agricultural station of Rothamsted started by John Bennett Lawes, with whom he was associated for fifty-seven

years, making the agricultural investigations the main work of his life.

Goltz, Graf Karl von der, a German soldier, born April 12, 1815; died in Paris, Feb. 21, 1901. He entered the Prussian army in 1832, served with the cuirassiers, commanded a regiment of hussars from 1859 to 1864, then a cavalry brigade till 1872, when he was appointed acting adjutant-general to the Emperor, serving till the death of Wilhelm I.

Got, Edmond, a French actor, born in Lignerolles, Orne, Oct. 1, 1822; died in Passy, March 21, 1901. He was educated in the Charlemagne Lyceum, graduating as laureate; was then employed in the prefecture of the Seine until he entered the conservatory in 1841. He went into the Théâtre Français in 1844, playing servants' rôles and becoming a *sociétaire* in 1850. He won the public and the critics from the start by the studied naturalness of his comic acting and by his talent for stage business and the picturesque relief he gave even to the most insignificant parts. The abbé in *Il ne faut jurer de rien* was one of his earliest triumphs, Tibia in *Le Caprice de Marianne* another. He put his mark on the valets of the classical drama of Molière, Regnard, Lesage, Marivaux, and Beaumarchais; but modern creations added more to his reputation, one of the first of which was *Duc Job* of Léon Laya in 1859. Still stronger was his Giboyer, *Les Effrontés* and *Le Fils de Giboyer* of Emile Augier, his college friend, whose favorite interpreter he became. When the Comédie Française hesitated to produce *La Contagion* in 1866, he got permission to take it to the Odéon and create the rôle of André Lagarde, whose phrase meaning that the hour will come when smothered truth will burst forth in a thunderclap was frantically applauded by the students as a protest against the absolutism of the second empire, to the dismay of the author, who stood well at court. In *Léons et Renards* and the subsequent pieces of Augier he created the most striking rôles. One of his greatest successes was as the rabbi in *L'Ami Fritz* of Ereckmann-Chatrian. His *Triboulet* in Victor Hugo's *Le Roi s'amuse* was a failure, and *Bellac* in *Le Monde ou l'on s'amuse* he had to transfer to Prudhon. Edmond Got was a man of letters also. He wrote two books of opera for Edmond Mentrée, *L'Esclave* and *François Villon*. He was professor in the conservatory.

Gramme, Zénobe, a Belgian electrician, born in Jehay-Bodignée, Huy, April 4, 1826; died in Paris, Jan. 20, 1901. He was the son of an official in the tax office who had a small salary, but spared nothing in the education of his three girls, who became eminent teachers. The son learned first the carpenter's trade, which he carried on when his parents removed to Liège. There he attended the trade-school. In 1855 he went to Paris and was employed as a pattern-maker in the works of the Alliance Company, which constructed electrical apparatus, especially the Rollet electro-magnetic machines for the generation of electric illumination for lighthouses. The phenomenon of induction struck his attention, and when he found that his independent conclusions coincided with those of Faraday and Ampère he sought further instruction from Ruhmkorff and Disderi, having no theoretical knowledge till then except what he had drawn from Ganot's treatise on physics and a few other books. With a poor apparatus installed in a kitchen he began to experiment, and in 1867 he obtained his first patent, which did not relieve his want, which was extreme, for he had given up his trade and the

labor of the wife supported the family. In 1869 he produced the earliest machine with constant current, and took out a patent for it. With this his future was assured. Gramme's discovery consisted in the application of the dynamo-electric principle to Pacinotti's circuit, whereby a practical machine could be made giving a strong continuous current without a commutator. His machines that were on exhibition in Philadelphia in 1876 were bought by the United States Government. He took the first prize at the Paris exposition of 1878, and with it a reward of 20,000 francs from the French Government. The cross of the Legion of Honor was bestowed upon him, but he declined the proffered naturalization as a French citizen.

Gras, Basile, a French soldier, born Jan. 2, 1836; died in Chablis, April 14, 1901. He studied in the École Polytechnique, entered the army, served in the Italian war with distinction, began to experiment on the construction of small arms in 1864 when attached to the manufactory of arms at Tulle, served in the field during the Franco-German War, and then devoted himself once more to designing a weapon to take the place of the heavy and complicated chassepot. The French Government adopted the Gras rifle in 1874 after a competition in which over 100 models were tested. In 1886 Gen. Boulanger sent Gen. Gras on a mission to the United States, whence he brought back various inventions which were utilized in designing the Lebel rifle.

Gras, Félix, a French poet, born in 1845; died in Avignon in March, 1901. He was a police justice in Avignon and one of the

and one of the school of Mistral and Roumanille, the revivers of Provençal poetry; wrote some noted poems himself, and was the director of the Provençal Society after Roumanille's death. He was the author of a curious book, *Rouges du Midi*, which had the remarkable

fortune to be published, in an English translation, in an American periodical before the Provençal original appeared.

Greenaway, Kate, an English artist, born in London in 1846; died there, Nov. 6, 1901. She was the daughter of a noted wood-engraver, and studied in the London art schools. She became a favorite designer of Christmas cards and illustrations for story-books, in all of which the figures were children arrayed in the fashions of the Directory. In 1879 she produced a book of her own called *Under the Window*, and in 1881 the *Kate Greenaway Birthday Book*. Her reputation was spread abroad by the praise of John Ruskin, and the influence of her decorative conceptions affected popular taste and artistic activity as well, not only in England and America, but notably in France. The style of dress reproduced in her drawings became the fashion for children's wear. She produced a series of almanacs and illustrated a great number of books for children in which modern methods of color-printing were first successfully applied.

Grekoff, M., a Bulgarian statesman, born about 1845; died in Sofia. He was president of

the Chamber in 1883, became a leader of the Conservative party, was Minister of Foreign Affairs in more than one Cabinet, and in 1899 was for a short time Prime Minister. He was a jurist of ability, and was well known outside of Bulgaria, having been educated in France.

Grumbkow Pasha, a Turkish soldier, born in Germany in 1849; died about July 1, 1901. Victor von Grumbkow was an officer in the Prussian army, in which he attained the rank of lieutenant-colonel. With the approval of the Kaiser he entered the Ottoman service and with Gen. von der Goltz Pasha, who returned to the German service, he elaborated the reforms introduced in the Turkish army, especially in the artillery. In the Greco-Turkish War of 1897 he received the Osmanieh order on the field of battle in recognition of his services in preparing the army for victory. He held the rank of lieutenant-general in the Turkish army and was aide-de-camp to the Sultan. Having resigned on account of ill health, he was returning to Germany when he died suddenly on the railroad train.

Gurko, Joseph Vladimirovich, a Russian soldier, born Nov. 15, 1828; died on his estate at Sacharow, near Tver, Jan. 29, 1901. He belonged to an ancient Lithuanian family, was educated in the pages' corps at St. Petersburg, received a commission in the hussar regiment of the Imperial Guards in 1846, served in the infantry of the line during the Crimean War, then returned to his old regiment, was made aide-de-camp to the Emperor in 1860 and promoted colonel in 1861, and in 1866 was assigned to the command of the hussar regiment, having distinguished himself by his energy and capability in the Polish insurrection of 1863. He rose steadily, and in 1876 he commanded a division of the Imperial Guard. When the Turkish war broke out in 1877 he was placed in command of the vanguard, consisting mainly of cavalry. He crossed the Balkans with swift marches, having the intention of seizing Adrianople and advancing to Constantinople before the widely scattered Turkish forces could be concentrated for its defense. The bold advance, condemned from the first by orthodox strategists, was checked at the Roumelian Railroad by the combined forces of Reuf Pasha and Suleiman Pasha, a powerful Turkish force having been brought round by sea from the Montenegrin frontier and sent up from Dedeagatch by rail. The celerity of the Russians had been admirable, but the Turks developed a mobility of which they were supposed to be incapable. Having come almost within sight of Adrianople, Gen. Gurko was obliged to fight a pitched battle against superior forces, and at Eski Saghra and Kesanlyk the advanced guard and the troops that had followed them were driven back to the Shipka pass, the occupation of which was the only fruit of the costly initial movement. The lines of communication were threatened by Osman Pasha, whose presence in northwestern Bulgaria had been ignored, but who now appeared on the Russian right flank and took up a strong position at Plevna, compelling the Russians to abandon Gen. Gurko's plan of operations altogether. Gen. Gurko was called to St. Petersburg to superintend the mobilization of the guards, then returned to take part in the siege of Plevna. He displayed good generalship in his later operations, and was only less successful than Gen. Skobelev. By the taking of Gorny Dubniak he hastened the fall of Plevna, and by advancing with the guards and cavalry through Sofia and Philippopolis to Adrianople he ended the war. In Bulgaria and Eastern Roumelia he was hailed as a liberator, and after the war he was made a

general of cavalry and adjutant-general. When the nihilists made an attempt to kill the Czar in April, 1879, Gen. Gurko was appointed governor-general with unlimited powers for the repression of disorders. He established a state of siege and used military means without stint. Yet he could not cope with the secret revolutionary societies, and after the explosion in the Winter Palace in February, 1880, he was dismissed in disgrace and retired from active service. His successors did no better, and after the assassination of Alexander II, in March, 1881, he was called back, advanced to the grade of field-marshal, and in 1883 was appointed Governor-General of Poland, where he dealt with the resistance offered to Russification by using stern and vigorous measures. Retiring with broken health in 1894, he lived henceforth in seclusion.

Hall, Fittedward, an English lexicographer, born in Troy, N. Y., in 1825; died in February, 1901. He resided in Oxford, published *Modern English* (1873) and other philological works, and began in 1879 to collect references and other materials for Dr. Murray's *Oxford English Dictionary*, to which he gave gratuitously four hours of labor every day from the beginning of its preparation.

Hanbury, Mrs. Elizabeth (Sanderson), an English philanthropist, born in London, June 9, 1793; died in Richmond, Oct. 31, 1901. She was of Quaker parentage, and when Mrs. Elizabeth Fry began the systematic visiting of Newgate prison she was joined by Miss Sanderson, who devoted herself to such labor for many years, being especially assiduous in visiting convict ships for women. Until she undertook this work the condition of these convict ships was most deplorable, but, largely through her efforts, much was done to better the surroundings of the prisoners upon them. She was associated with the Gurney and Buxton families in their philanthropic work, as well as with Clarkson, the famous abolitionist. She married Cornelius Hanbury in 1826, and spent much of her after life in Stoke Newington, London, becoming in course of time an "acknowledged minister" among the Friends. Throughout her long life she maintained a deep interest in religious and benevolent undertakings, and she was still able to read and write after passing her hundredth year.

Harvey, Moses, British clergyman, born near Armagh, Ireland, in 1820; died in St. Johns, Newfoundland, Sept. 3, 1901. He received his education at Queen's College, Belfast, and was for eight years Presbyterian minister at Maryport, Cumberland. In 1852 he took charge of the Presbyterian Church in St. Johns, retiring from the ministry in 1878 and devoting himself thereafter to literary work. He was an enthusiastic admirer of his adopted country, and published much in relation to it. In 1873 he discovered the gigantic cuttlefish, since named the *Megalu- tis harveyi*. Besides contributing to the *Encyclopædia Britannica* articles relating to Newfoundland, he published *Thoughts on the Poetry and Literature of the Bible* (1853); *The Testimony of Nineveh to the Veracity of the Bible* (1854); *Lectures on the Harmony of Science and Revelation* (1856); *Lectures on Egypt and its Monuments as Illustrative of Scripture* (1857); *Lectures: Literary and Biographical* (1864); *Across Newfoundland with the Governor* (1878); *Newfoundland: The Oldest British Colony* (1883); *Newfoundland as it is in 1894* (1894); *Text-Book of Newfoundland* (1885); *Whither are we Tending?* (1886); and *Newfoundland in 1897* (1897). He wrote the article *Newfoundland* for this *Cyclopædia* in the years 1890-1900 inclusive.

Haweis, Hugh Reginald, an English author, born in Egham, Surrey, April 3, 1838; died in London, Jan. 29, 1901. He was the son of a canon of Chichester Cathedral. He was educated at Cambridge, but before taking his degree had traveled in Italy and served under Garibaldi in the struggle for independence. He took priest orders in the Established Church in 1862. After holding curacies at St. Peter's, Bethnal Green, St. Peter's, Stepney, and St. James the Less, Westminster, successively, he became in 1866 the incumbent of St. James's, Westmoreland Street, Marylebone, a Crown living, which he held up to the time of his death. He was a man of versatile talents and peculiar pulpit methods at times, but his influence was extensive. At one time he was select preacher at Westminster Abbey; he delivered a course of Lowell lectures in Boston, Mass., in 1885, and was an Anglican delegate to the Parliament of Religions at Chicago in 1893. In 1895 he made a lecturing and preaching tour of the world. He wrote extensively on both religious and secular themes, and his many books have enjoyed a wide circulation. *Music and Morals*, in which the emotional theory of music is expounded, is the best known of all of them. Besides his original work he edited several books and was for some time the editor of Cassell's Magazine. He possessed a vigorous, animated style that was not infrequently brilliant and was always entertaining. His published books comprise *Music and Morals* (London, 1871); *Thoughts for the Times* (1872); *Unsectarian Family Prayers* (1874); *Pet, or Pastimes and Penalties* (1874; enlarged with the title *The New Pet*, 1875); *Ashes to Ashes: A Cremation Prelude* (1874); *Speech in Season* (1875); *Current Coin* (1876); *Arrows in the Air* (1878); *Poets in the Pulpit* (1880); *American Humorists* (1883); *Key of Doctrine and Practise* (1884); *My Musical Life* (1884); *My Musical Memories* (1884); *Winged Words* (1885); *Travels of Dr. Livingstone* (1886); *Christ and Christianity* (5 vols., 1886-'87); *The Broad Church* (1891); *Sir Morell Mackenzie's Memoir* (1893); *Travel and Talk: 1885-'93-'95* (1896); *Ideals for Girls* (1897); *The Dead Pulpit* (1897); and *Old Violins* (1898).

Haym, Rudolf, a German author, born in Grüneberg, Silesia, Oct. 5, 1821; died in Halle, Aug. 28, 1901. He studied theology and philosophy in Halle and Berlin, taught in a gymnasium in Berlin and in a commercial school, went to Halle in 1846 to write a book on the orators of the first Prussian Diet, which on its appearance in the following year drew the attention of political circles to the author and led to his being elected from Mansfeld to the Frankfort Parliament, in which as an Old Liberal he took his seat in the Right Center. After the Parliament was broken up he conducted in Berlin the *Constitutionelle Zeitung* until he was expelled by the police. He published a history of the German National Assembly. Returning to Halle in 1851, he was made tutor of philosophy and modern literary history, and became in 1860 extraordinary and in 1868 ordinary professor. He was once sent from Halle, in 1866, to the Prussian Diet. His professorship lasted until his death. He published *Wilhelm von Humboldt* (1856); *Hegel und seine Zeit* (1857); *Arthur Schopenhauer* (1864); *Die romantische Schule* (1870); *Herder nach seinem Leben und seinen Werken* (1877-1885); and *Das Leben Max Dunckers* (1890). He was the founder of the *Preussische Jahrbücher*, and editor of the magazine from 1858 till 1864.

Hellmuth, Isaac, an Anglican clergyman, born in Warsaw, Poland, Dec. 14, 1826; died in

Weston-super-Mare, England, May 30, 1901. He was of Jewish parentage, and at the rabbinical schools to which he was sent in childhood he was notably proficient. After studying at the University of Breslau, where he became interested in Christianity, he went to England in 1841 and was received into the Christian faith. In 1844, after three years spent in the study of theology, he went to Canada, and in 1846 entered the priesthood of the Anglican Church. For some years he was rector of Sherbrooke, in the province of Quebec, and at the same time Professor of Hebrew at Bishops' College, Lenoxville. In 1863 Huron College, at London, Ontario, was opened, with Dr. Hellmuth as its president. He founded in 1867 a school for boys at London, called Hellmuth Boys' College, and in 1869 the Hellmuth Ladies' College also, his own large private fortune being unsparingly used in these enterprises. In 1871, after he had been successively archdeacon and dean of Huron, he was consecrated Bishop of Huron. Some time later he conceived the idea of founding a Western University in connection with Huron College, and in 1880 he visited England to solicit funds for that object. The institution was opened the next year. He resigned his bishopric in 1883 to become suffragan to the Bishop of Ripon in England, with the title of Bishop of Hull, but two months after his resignation it was discovered that the Act of Henry VIII regarding suffragan bishops was inapplicable to persons already consecrated as bishops. To relieve him in part from his anomalous position he was appointed assistant bishop, or coadjutor to the Bishop of Ripon, but in 1884, when the Bishop of Ripon died, Bishop Hellmuth's commission as bishop coadjutor expired. He was rector of Bridlington, Yorkshire, in 1885-'91; chaplain of Trinity Church at Pau, France, in 1891-'97; and rector of Compton Pauncefoot, Somerset, in 1897-'99. Bishop Hellmuth was a strong evangelical throughout his long career, and sympathized very little with the newer schools of thought within the Established Church. He published *The Divine Dispensations and their Gradual Development* (1866); *The Genuineness and Authenticity of the Pentateuch* (1867); and *Biblical Thesaurus* (1884).

Hemying, Samuel Bracebridge, an English author, born about 1840; died in London in November, 1901. He was called to the bar in 1862, but his time was mainly given to the writing of sensational fiction, and as Jack Harkaway he became widely known. Besides contributing largely to periodicals, he published more than 40 volumes, the chief of which are *The Castle of Ivinsk* (1860); *The Dark Cloud with a Silver Lining* (1861); *Gaspar Trenchard* (1864); *Eton School Days* (1864); *The Orange Girl* (1865); *Butler Burke at Eton* (1865); *Called to the Bar* (1867); *Secrets of the Dead Letter Office* (1868); *Contesting the County and Other Tales* (1868); *Secrets of the Turf* (1868); *The Danger Signal and Other Tales* (1868); *The Favorite Scratched* (1869); *Held in Thrall* (1869); *The Girl of the Period: Her Fortunes and Misfortunes* (1869); *The Man of the Period* (1870); *The Season at Brighton* (1870); *Curious Crimes* (edited) (1871); *The Commune in London, or Thirty Years Hence* (1871); *Too Sharp by Half* (1871); *Telegraph Secrets* (1877); *River Secrets* (1880); *On the Road, or the Adventures of a Cabman* (1880); *Strange Journeys* (1880); *In the Force* (1880); *The Bondage of Brandon* (1881); *The Women of London* (1884); *The Women of Paris* (1884); *The Stockbroker's Wife and Other Sensational Tales* (1885); *Tried for his Life and*

Other Stories (1885); *A Dead Heat* (1887); *The Demon Jockey* (1888); *Sharks of Society* (1888).

Herbette, Jules, a French diplomatist, born in 1839; died in Paris, Dec. 18, 1901. He was a consul under the empire, though a Republican, and became secretary to Jules Favre, the first Minister of Foreign Affairs under the republic. He remained at the Foreign Office, becoming chief secretary under M. de Freycinet, and succeeded Baron de Courcel as ambassador at Berlin.

Hermite, Charles, a French mathematician, born in Dieuze, Lorraine, Dec. 25, 1822; died Jan. 14, 1901. He studied at Nancy and Paris, spent his life in mathematical pursuits, and became professor at the Sorbonne of higher algebra and honorary professor at the École Polytechnique. His papers in the mathematical journals treat of the theory of numbers, algebraic forms, elliptic functions, and most of the subjects connected with higher mathematics. With Gerretet he made a new edition of the *Differential and Integral Calculus* of Lacroix (1867).

Hohenlohe-Schillingsfürst, Prince Chlodwig von, a German statesman, born in Rothenburg on the Fulda, March 31, 1819; died in Ragaz, Switzerland, July 5, 1901. He studied law in Heidelberg, Göttingen, and Bonn, entered the Prussian judicial service at Ehrenbreitstein in 1842, was attached to the courts at Potsdam and Breslau, but in 1846 his fortunes called him back to Bavaria. As a younger son he had looked forward only to a life of official routine and small emolument. The death of his eldest brother changed his fate. By a compact with his brother Victor, Duke of Ratibor, he received the domain of Schillingsfürst, making him a Bavarian magnate with a seat in the upper house of the Diet. In his friendship toward Prussia he stood alone among the members, who were suspicious of him on that account. In 1849 he was sent as Bavarian envoy to London, but soon returned, and since his liberalism and his belief in German unity under Prussian headship found no echo in the sentiments of the Bavarian aristocracy, he took little part in public affairs, though his political sagacity came to be appreciated gradually. There were a great many adherents among the middle classes of the idea of a democratic Great Germany under a Federal Parliament. In Government circles a dream was entertained of a joint control which Bavaria should share with Austria and Prussia. In the war of 1866, Bavaria refusing the favorable terms that Prussia offered in return for an attitude of benevolent neutrality, took up arms with Austria. After the crushing victory of Königgrätz, the moderate terms of peace imposed by Prussia—only a war indemnity of 30,000,000 gulden and an offensive and defensive alliance—produced a reaction in favor of Prussia, henceforth Bavaria's ally. Prince Hohenlohe, Prussia's friend, the living bridge over the Main, as he came to be called, was the man of the hour. On Dec. 31, 1866, he was appointed Prime Minister. His policy was to complete a military alliance giving the Prussian monarch command over all the armed forces of Germany and to form a South German Confederation, in which Bavaria would hold a position of more influence and dignity than if she entered the North German Confederation, which indeed Prussia did not desire, as it would alarm France. The Ultramontanes of Bavaria were opposed to the Prussian tendency, and opposed the Zollverein. Prince Hohenlohe offended them also by his school-reform projects, and while the Ecumenical Council was sitting he addressed a circular note to the powers, in which he argued that

the doctrine of papal infallibility would endanger the civil power. The Council of the Vatican created as much tension in south Germany as the question of German unity. Catholics were divided into two parties, and some were ready to secede from the Church. Princes of the Church, like Cardinal Hohenlohe, the minister's brother, strove to prevent the inevitable decision. The minister himself was in association with Catholics of the most Liberal stripe, like Dr. Döllinger. His note met with no positive response from the other cabinets. It embittered the Ultramontanes against him. They obtained a small majority in the election of 1869, and a dissolution increased it. The King still desired to retain him, and reluctantly accepted his resignation on Feb. 15, 1870, after a vote of censure had passed both houses. His influence and counsel were still potent in the great era of transformation. From his seat in the upper house he impressively advocated the participation of the Bavarian army in the war against France, and in 1871 he took the foremost part in securing the adoption by Bavaria of the Constitution of the German Empire. Being elected to the first German Reichstag from Forchheim, he was chosen vice-president. From this position Prince Bismarck called him in 1874 to represent the empire at the capital of France, after the recall and disgrace of Count Harry von Arnim. Von Arnim had closer relations with the aristocracy of the Faubourg St. Germain than with the statesmen of the republic, which he looked upon as ephemeral. He believed it to be in Germany's interest to hasten the restoration of the monarchy. Bismarck intended to pursue the contrary policy, and Prince Hohenlohe, a man belonging to the highest aristocracy, surprised both his acquaintances of the French nobility and the Republican politicians by cultivating social relations with the official world and with the constantly changing ministers of the republic, who were all alike in being sensitive and suspicious in regard to Germany. His suavity and tact smoothed away many a difficulty, and Frenchmen came to look upon him as a guardian of peace. When he was finally called away from Paris in 1885 to become Statthalter of the Reichsland much of the bitterness that Manteuffel's régime engendered passed away because Frenchmen felt that the lost provinces were now in tender hands. His administration was indeed milder than that of his predecessor, and his conciliatory efforts had such marked success that the passport system was abolished, and the hatred of German domination and the dangerous international friction which it created died out. At the end of October, 1894, on the resignation of Count von Caprivi, the Emperor summoned Prince Hohenlohe to be the third German Chancellor. His acceptance of the chancellorship of the empire and minister-presidency of Prussia averted a serious internal crisis by appeasing the Agrarians, the Bismarckians, and the Liberals at once, all of whom claimed political affinities to the new Chancellor, and he relieved the anxieties entertained abroad that the young Emperor would plunge into foreign adventures. His chancellorship was a period of transition and conflict in internal politics, but the régime of absolutism and reaction and the military ambitions which were threatened before he took office were not heard of again, and his remaining in office was a guarantee that no extreme or eccentric policy would be carried out at home or abroad. He could not restrain the jealousies and intrigues among the ministers or check their clashing party alliances that were undermining and disorganizing the ad-

ministration, and his grasp, already more supple than strong, had grown weaker with age. After a change of ministry, which came to relieve the situation, hampered, obstructed, and delayed by Dr. von Miquel and circumvented by Count Potemodowsky, the aged Chancellor, who had already resigned the conduct of foreign affairs into the hands of Count von Bülow, let the other ministers tangle up the public business till he could neither approve nor explain the Government measures. He wanted to resign, and when Count von Bülow showed qualities indicating that he could fill the office, the Emperor, Oct. 17, 1900, relieved Prince Hohenlohe of the post that he originally accepted after much solicitation for patriotic reasons.

Hood, Arthur William Acland, Lord, an English naval officer, born in Somersetshire, July 14, 1824; died in Glastonbury, Nov. 15, 1901. He entered the navy, in which several members of his family had gained distinction, in 1836, saw fighting in Spain and on the coast of Syria, became a lieutenant in 1846, was promoted commander in 1854 for services with the naval brigade before Sebastopol and captain in 1858 for services in the capture of Canton, was director of naval ordnance from 1869 till 1874, became rear-admiral in 1876, received a seat in the Admiralty, was first naval lord from 1885 till 1889, and after retiring from active service succeeded by seniority to the rank of vice-admiral in 1880 and admiral in 1886. He was knighted in 1885, and in 1892 raised to the peerage with the title of Baron Hood of Avalon.

Hopkins, Edward John, an English organist, born in London, June 13, 1818; died in February, 1901. At the age of eight he was a chorister in the Chapel Royal, and presently he became a pupil of Walmisley, the organist of St. Martin's-in-the-Fields. At sixteen he became organist of Mitcham Church, in Surrey, and at twenty was organist of St. Peter's, Islington. At this period he gained the Gresham gold medal for his anthem *God is Gone Up*. He was organist of St. Luke's, Berwick Street, in 1841-43, became organist of the famous Temple Church in London in the year last named, and retained this place till his resignation in 1898. Besides composing many anthems, voluntaries, etc., he was the author of a standard work entitled *The Organ: Its History and Construction* (1855), and of many articles in *Grove's Dictionary of Music*. His latest years were devoted to writing *An Entirely New and Comprehensive Treatise on the History and Construction of the Organ*, which at the time of his death was practically completed. His hymn tunes, which have been widely circulated, are devotional and dignified, and wholly free from sentimentality.

Hopkins, William Jeffrey, an English architect, born in 1821; died in Worcester, England, May 28, 1901. He settled in Worcester in early life, and one of his first works was the erection of the Corn Exchange (now the Worcester Public Hall). He restored churches at Norton and elsewhere in Worcestershire and built many new ones, among which are Holy Trinity, Worcester, to which he adapted the beautiful fourteenth-century roof of the ruined Guesten Hall near the cathedral; Blackheath, near Birmingham; and Hallow, near Worcester. Among country-seats designed by him are Parkfield, Worcester, and Kildangan, County Kildare, Ireland. He was a fellow of the Royal Institute of British Architects, and diocesan architect of Worcester.

Hoskins, Sir Anthony, an English naval officer, born in 1828; died in Capel, Surrey, June 21.

1901. He entered the navy in 1845, became captain in 1863, after taking an active part in the Chinese war, was a lord of the Admiralty in 1880, and in 1882 was charged with the operations for the protection of the Suez Canal previous to the arrival of Lord Wolseley's forces, in which he acquitted himself in a manner to deserve the thanks of Parliament. He was admiral commanding the naval reserves till 1885, commanded the Mediterranean squadron from 1889 till 1891, then First Lord of the Admiralty for two years, at the end of which he retired.

Ingram, Thomas Dunbar, an English jurist, born in 1826; died in Dublin, Ireland, Dec. 30, 1901. He was educated at Queen's College, Belfast, and at London University, and was called to the bar in 1854. He went to India, where he was for some time Professor of Jurisprudence in the Presidency College at Calcutta, and an advocate of the High Court of Judicature of India. He was the author of *Compensation to Land and House Owners* (1864); *Two Letters on some Recent Proceedings of the Indian Government* (1871); *A History of the Legislative Union of England and Ireland* (1887); *Two Chapters of Irish History* (1888); *England and Rome: A History of the Relations between the Papacy and the English State and Church from the Norman Conquest to the Revolution of 1688* (1892); and *A Critical Examination of Irish History* (1900).

Jack, Mrs. Agnes Jane (Nichol), a Scottish novelist, born in Glasgow, Scotland, in 1837; died there in November, 1901. She was the daughter of John Pringle Nichol, for many years Professor of Astronomy in Glasgow University, and a younger sister of the late John Nichol, the well-known Scottish critic. She married William Jack, a professor in the university in which her father and brother were long prominent. Her novels, *Brother and Sister* and *A Passion Flower*, were published anonymously.

Jacobs, Henry, an English clergyman, born in the Isle of Wight in 1824; died in Christ Church, New Zealand, in March, 1901. He was educated at Oxford, and after taking orders in the Established Church was successively curate of Bussage, Gloucestershire, head master of St. Nicholas's School, at Shoreham, and curate of Poplar. He went to New Zealand at the close of 1850, and was master of the newly established grammar school in Christ Church for eleven years. He became Dean of Christ Church in 1866, resigning in 1891. He was the author of a *History of the New Zealand Church* and edited the *New Zealand Church News* for many years.

Jeaffreson, John Cordy, an English author, born in Framlingham, Suffolk, England, Jan. 14, 1831; died in London, Feb. 2, 1901. He was the son of a surgeon, and received his university education at Oxford. After spending some time as a tutor, he studied law and was called to the bar in 1859, but practised his profession slightly if at all. He had begun to write novels soon after taking his university degree, and after becoming popular as a novelist he continued to put forth novels, biographies, and other works at frequent intervals for nearly forty years, besides contributing largely to periodicals. For many years he was inspector of records and documents for her Majesty's Commissions on Historical Manuscripts. His work in fiction includes *Crew Rise* (1854); *Isabel, the Young Wife and the Old Love* (1856); *Miriam Copley* (1859); *Sir Everard's Daughter* (1860); *Olive Blake's Good Work* (1862); *Live it Down: A Story of the Light Levels* (1863); *Not Dead Yet* (1864); *A Noble Woman* (1868); *A Woman in Spite of Herself*

(1871); *Lottie Darling* (1873); *The Rapiers of Regent's Park* (1882); and *Cutting for Partners* (1890). His remaining works are *Novels and Novelists from Elizabeth to Victoria* (1858); *A Book about Doctors* (1860); *Life of Robert Stephenson* (1864); *A Book about Lawyers* (1866); *A Book about the Clergy* (1870); *Annals of Oxford* (1870); *Brides and Bridals* (1872); *A Book about the Table* (1874); *A Young Squire of the Seventeenth Century*, edited (1878); *The Real Lord Byron* (1885); *The Real Shelley* (1885); *Lady Hamilton and Lord Nelson* (1887); *The Queen of Naples and Lord Nelson* (1889); *Victoria, Queen and Empress* (1893); and *A Book of Recollections* (1893).

Jellett, Henry, an Irish clergyman, born in Ireland about 1820; died in Dublin, Dec. 31, 1901. He was graduated at Trinity College, Dublin, in 1842, and took orders in the Irish Episcopal Church in 1844, his ministry being subsequently in the south of Ireland. He was already a canon of St. Patrick's Cathedral, Dublin, when in 1884 he became Archdeacon of Cloyne, and in 1889 he succeeded to the deanery of St. Patrick's. Dean Jellett was prominent in Irish Church affairs, and took an active part in the reorganization of the Church after its disestablishment in 1869. He was a staunch theologian and a most effective preacher. His published works are *The Irish Church and the Articles of 1615* (1850) and *Some Thoughts on the Christian Life* (1884).

Kaizl, Joseph, an Austrian statesman, born in Bohemia in 1854; died in Miskowitz, Aug. 20, 1901. He studied in Strassburg, taught political economy in Prague University while it was German, and became professor when it was converted into a Czech institution. Being a ready and elegant speaker equipped with modern social science and political knowledge, he became prominent in politics, first attaching himself to the Old Czechs, and going over to the Young Czech party like many of his associates when the conflict over languages became earnest. When it became necessary to give a ministerial post to the Czech group Dr. Kaizl, although he had been known as a Socialist of the chair and a Radical, entered the Thun Cabinet as Minister of Finance.

Karl, Alexander, Grand Duke of Saxe-Weimar, born June 24, 1818; died in Weimar, Jan. 5, 1901. He was the youngest child of the hereditary Grand-Duke Karl Friedrich and Maria Paulowna, Grand Duchess of Russia. The golden days of the reign of Karl August passed away during his childhood, but Goethe was still alive and celebrated the birth of the fortunate prince with a poem entitled *Die Künste*, and took particular interest in the early education of Karl August's grandson. The young hereditary, after a long journey in Italy, studied for one year at the University of Leipsic, then at Jena for one year, after which he visited the courts of Berlin, St. Petersburg, Paris, London, and The Hague, and in 1840, having been passed through the subordinate grades, entered the Prussian army as colonel of cuirassiers, and in two years of active service in command of a regiment was advanced to the rank of field-marshal. On Oct. 8, 1842, he married Sophia, Princess of the Netherlands, then eighteen years of age, who bore him three children. The eldest was the hereditary Grand-Duke Karl August, born July 31, 1844, who died Nov. 20, 1894, leaving two sons by Princess Pauline of Saxe-Weimar, his first cousin, whom he married in 1873. Of the daughters of Karl Alexander the elder, Princess Marie, married the Prince of Reuss-Schleiz and the younger, Princess Elisabeth, Duke Johann Albrecht of Mecklenburg, afterward Re-

gent of Mecklenburg-Schwerin. The death in 1900 as the result of a carriage accident of Prince Bernhard Heinrich, the late hereditary grand duke's younger son, left the elder son, Prince Wilhelm Ernst, born June 10, 1876, as his grandfather's only direct male descendant, who was still unmarried when he succeeded him as grand duke. When Karl Alexander succeeded his father on July 8, 1853, he swore to observe the revised Constitution of Oct. 15, 1850. With the assistance of his Minister Watzdorf he saved his principality from casting its lot with Austria in 1866, and in 1870 and 1871 he shared the perils and hardships of the campaign of the German army in France. When the deliberations over the Constitution of the German Empire came to a deadlock in the Federal Council and the German Parliament, he telegraphed on Dec. 7, 1870, to the Weimar delegation in the Federal Council to formulate the measure that solved the question of the imperial prerogative in the constitutional manner laid down in the resolutions of the North German Federal Council and the Reichstag. The Empress Augusta was his sister, and Bismarck was his lifelong friend. In his own principality he promoted communal self-government, the formation of agricultural associations, the extinction of feudal privileges, the construction of a complete railroad network, and the establishment of institutions for the general good, especially the people's schools, for which considerable sums were found in spite of a strict and even parsimonious economy in the state finances, pursued for the purpose of paying off old debts. The system of popular education introduced in 1874 was in its principal features adopted by other German states. The grand duke took a direct interest in the higher schools and in the development of art industry. He cultivated his inherited artistic taste, and from his youth aided and encouraged the patriotic and romantic movement in German art, learning, and literature—the music of Wagner and of Liszt, who was chapel-master of the Weimar court theater; the paintings of Schwind and Böcklin, the literary creations of Hoffmann von Fallersleben, Theodor Storm, and Franz Dingelstedt. The restoration of the Wartburg was the work of his youth, the foundation of the Weimar art school and museum the plan of later years.

Key, Bransby Lewis, an English colonial prelate, born in 1838; died in London, Jan. 12, 1901. He was ordained in 1864, and at once began his labors in the missionary field, having been assigned to the Transkei district in South Africa. After nineteen years spent in this work, he was in 1883 consecrated bishop coadjutor to the bishop of St. John's, Kaffraria. He succeeded to the bishopric in 1886, his jurisdiction extending over the districts of Transkei, Tembuland, Griqualand East, and Pondoland.

Koenig, Rudolf, a German physicist and acoustician; born in Königsberg in 1833; died in Paris, Oct. 2, 1901. In 1860 he was established in Paris as a constructor of acoustical instruments, and here he did his life work. The phonograph or phonautograph of M. Scott de Martinville, for recording the vibrations of tones and words, was brought to Koenig for completion. The idea of using these records for audibly reproducing the words, as was done nearly twenty years afterward by Edison and others, seems never to have occurred to Koenig. He constructed a series of standard tuning-forks, improved the construction of the Seebeck siren, invented the manometric flame, repeated the famous experiments of Philipp Reis with his primitive tele-

phone, and revised a new stethoscope. In 1862 he began the publication of his experimental researches in acoustics, which lasted nearly forty years. In 1876 he exhibited his instruments at the Centennial Exposition in Philadelphia. Among them was a tonometer consisting of 670 tuning-forks. In 1882 he reconstructed and enlarged this, extending the lower forks down to a vibrative frequency of only 16, and the upper ones beyond the superior limits of audition. The fact that Koenig was a practical acoustician and earned his livelihood in his shop prevented the general recognition of his great talents as an original investigator. The only official recognition his work ever did receive came from the Physical Society of London, which made him an honorary fellow in February, 1901. In 1882, under the title *Quelques Experiences d'acoustique*, he published a volume describing his acoustical researches. A paper published in Poggendorff's *Annalen*, in 1876, on the phenomena produced by the interference of two tones, is one of the classics of science, and is perhaps his most important contribution to pure science.

Kruger, Susanna Du Plessis, wife of the President of the South African Republic, died in Pretoria, July 20, 1901. She was the second wife of Paul Kruger, the niece of his first wife. Her family, which was the same as that of Armand du Plessis, Cardinal Richelieu, has numerous branches in South Africa. She was married at the age of sixteen, and bore her husband 16 children, of whom 10 were living at the time of her death. Tante Sanna, as she was universally called, was known throughout South Africa, although she concerned herself about neither politics nor society, and kept up the simple habits of a frugal and laborious farmer's wife after her husband had become a wealthy man and President of the republic, attending to the washing and other housework in black gown and sunbonnet, with sleeves rolled up. She drove sharp bargains in selling the tobacco grown on their estate in the Magaliesberg. She knit all her husband's stockings and made his coats after the pattern of one that a tailor cut for him after the battle of Majuba Hill. When a visitor found the pair sitting on the veranda the President presented him to Mevrouw Kruger, who immediately arose and with a courtesy retired into the house, where she could be heard chiding the Kaffir servants. Cooking, mending, and making coffee were her daily occupations. She was a woman of great kindness of heart, and while Kruger was very stingy she often gave in secret out of her niggardly allowance for household expenses. Whoever came to the house at any hour of the day was served with coffee. When Kruger had departed for Europe and the British occupied Pretoria, Lord Roberts placed a guard in front of the house to protect her from annoyance, and she prepared coffee daily for the sentries and made them cakes.

Lewis, John Travers, a Canadian prelate, born in Cork, Ireland, in 1825; died at sea, May 6, 1901. His father was an Anglican clergyman. The son was graduated with high honors at Trinity College, Dublin, in 1848, took orders, and in 1850 went to Canada, where his mother was living; was a missionary at West Hawkesbury till 1854, then rector of Brockville. In 1862 he was consecrated at Kingston as the first Bishop of Ontario. In 1893, a synod held in Toronto having resolved that the Canadian Church should be divided into two provinces, Dr. Lewis was made Archbishop of Ontario and Metropolitan of Canada, while to Bishop Machray were given the

titles of Archbishop of Rupertsland and Primate of all Canada. In the beginning of 1900 Dr. Lewis resigned his episcopal office.

Lissagaray, M., a French journalist, born in Auch in 1838; died in Paris, Jan. 25, 1901. He lived for several years in the United States in his early life, returning in 1864 to Paris, where he lectured and wrote for the press and was a Republican in politics. He was challenged by Paul de Cassagnac for attacking the empire, and was wounded in a duel. During the Commune he published the *Action* newspaper, and when the Commune fell he fled to London, where he subsisted miserably by giving lessons and writing letters to newspapers. He wrote a history of the Commune which was printed in Brussels. After the amnesty of 1880 he returned to France and started the *Bataille* newspaper, in which he inveighed against Gen. Boulanger, leading to a duel with Henri Rochefort.

MacCormac, Sir William, surgeon, born in Belfast, Ireland, Jan. 17, 1836; died in Bath, England, Dec. 4, 1901. He was the eldest son of Dr. Henry MacCormac, a practitioner of Belfast and a professor in the Belfast Institute. In 1856 he was graduated at the Queen's University of Ireland, and in 1864 became a fellow of the Royal College of Surgeons of Ireland. In the same year he was elected surgeon to the Royal Belfast Hospital. He subsequently became a member of the senate of Queen's University, and received its gold medal. He received honors from the University of Dublin. In 1871 he was admitted *ad eundem* a fellow of the Royal College of Surgeons of England. In 1881 he was knighted as a recognition of his services in connection with the International Medical Congress. In 1897 he was created a baronet, and appointed surgeon-in-ordinary to the then Prince of Wales. In 1898 he received from Queen Victoria the knighthood of the Royal Victorian order in recognition of his services to the Prince of Wales. In 1901 he received the knighthood of the Bath. He also held many foreign honors. He was president of the Royal College of Surgeons in England five years. He led a life of great activity, participating in the Franco-Prussian War in 1870; in the Turko-Servian War of 1876, where he was associated in the Anglo-American ambulance corps with Dr. Marion Sims, of New York; and in the Boer War in 1899. He was surgeon to St. Thomas's Hospital in London for a number of years, and was an examiner for the Royal College of Surgeons of England, and also for the University of London. His early life abroad had made him an accomplished linguist. His successful management of the International Medical Congress, which he organized, was largely due to the friendships and knowledge gained during his student years on the Continent. He was a contributor to the medical journals, but left only a few completed volumes. Work Under the Red Cross was abstracted from his diary during the Franco-Prussian War. In 1879 he was instrumental in starting a debate regarding the then comparatively new antiseptic surgery. He subsequently combined the addresses and discussions of this congress with a general chapter on the antiseptic theory, and published them in book form. In 1895 he published the first section of an extensive treatise upon Surgical Operations. He, however, never finished the remaining sections. He was a very successful teacher and was much beloved by his students.

McKenzie, Sir John, a New Zealand statesman, born in Ardross, Scotland, in 1838; died in Wellington, Aug. 6, 1901. He emigrated to New Zealand in 1860, took employment in Otago prov-

ince, became working manager of a station near Palmerston, and afterward carried on farming on his own account in the Shag valley. He was a candidate for the Otago Council in 1868, and in 1871 he was elected, and represented Waihemo until the provinces were abolished. He was elected to the New Zealand House of Representatives for Moeraki in 1881, and in later years for other constituencies in his section of the country, never being without a seat. He was appointed Minister of Lands and Immigration in 1891 in the Ballance ministry.

Maclagan, Christian, a Scottish archeologist, died May 10, 1901, at the age of ninety. She had long been lady associate of the Society of Antiquaries of Scotland. In her opinion, the Druid circles, so called, were the skeleton uprights of prehistoric forts, and in her antiquarian enthusiasm she had taken rubbings of most of the engraved stones of Scotland. These rubbings have now become extremely valuable, as many of the inscriptions on the stones have since been worn away. Miss Maclagan published *The Hill Forts, Stone Circles, and Other Structural Remains of Ancient Scotland* (1875); and *Chips from Old Stones* (1881).

Macpherson, Hugh Alexander, a Scottish clergyman, born in 1848; died at Pitlochry, Nov. 26, 1901. He was educated at Oxford, and was ordained to the Anglican ministry in 1882. After being successively curate of St. James, Carlisle, 1882-'85; St. John's, Upper Holloway; and Holy Trinity, Paddington, he was appointed chaplain to the Government prison at Carlisle, 1888-'96. From 1896 to 1899 he was vicar of Allonby, Cumberland, and from 1899 incumbent of Pitlochry. He was a naturalist of note, and besides publishing *A Vertebrate Fauna of Lakeland*, including Cumberland and Westmoreland, with Lancashire North of the Sands (1892) and *A History of Fowling* (1897), contributed natural history chapters to the volumes of the *Fur and Feathers Series*—viz., *The Partridge* (1893); *The Grouse* (1894); *The Pheasant* (1895); *The Red Deer* (1896).

Madan, Henry George, an English scientist, born Sept. 6, 1838; died in Gloucester, Dec. 22, 1901. He was educated at Oxford, and for twenty years was head of the science department of Eton College. Subsequently he was junior bursar of Queen's College, Oxford. He was the author of *Exercises in Practical Chemistry*, with A. G. V. Harcourt; *Tables of Qualitative Analysis* (1881); *Wilson's Inorganic Chemistry*, revised and enlarged (1883); *Lessons in Elementary Dynamics* (1886); and *Elementary Treatise on Heat* (1889).

Manuel, Eugène, a French poet, born in 1823; died in Paris, June 2, 1901. He entered at an early age the Normal School, became professor at Dijon after completing his studies, and afterward at Grenoble and at Jouy. In 1852 he published an edition of the lyrical works of Jean Jacques Rousseau. In 1860 he published a book of poems called *Pages Intimes*, which by their simple grace and touching sentiment won their way to the hearts of hosts of readers. Jules Simon called him into the Ministry of Education, in which he remained till his death, rising to be Inspector-General of Education. He published *Poèmes Populaires* in 1871, and his *Henri Regnault, Pigeons de la République, Pendant la Guerre, and L'Absent* made him the most popular poet in France. For the stage he wrote *Les Ouvriers*, which is in the repertoire of the Comédie Française.

Mathews, Sir Lloyd William, a British administrator, born in 1850; died in Zanzibar, Oct. 11, 1901. He entered the British navy at an early

age, served in the Ashanti war of 1873, and afterward was employed in capturing Arab dhows carrying slaves from the east coast of Africa to Arabia. In 1883 he entered the service of the Sultan of Zanzibar, who made him his general. He raised and equipped 1,000 regular and 5,000 irregular soldiers, and ultimately obtained control over the civil as well as the military administration. When Great Britain assumed a protectorate over Zanzibar in 1890 Gen. Mathews was appointed British consul-general, but gave up the post to another, while he became the real ruler of the country with the title of Prime Minister, and thoroughly reorganized and Anglicized the administration, of which the Sultan was deprived of control.

Mapleson, James Henry, an English operatic impresario, born in London, May 4, 1830; died in that city, Nov. 14, 1901. Col. Mapleson was wont to say that he made his theatrical debut at the age of two months, when for three weeks he appeared as the infant in Henry VIII in the company with Edmund Kean. He began his education in music as a student in the Royal Academy of Music in London. He made an unsuccessful attempt as a singer, and then for a time played the viola in an orchestra. Subsequently he organized concert companies, with which he made extended tours throughout Great Britain. In 1861 he became sole manager of the Lyceum Theater, London, and opened it, June 8, with a performance of *Il Trovatore*, with Tietjens and Alboni in the cast. In 1862 he began his famous career as the manager of Her Majesty's Theater, when, with a company of famous singers, he produced Italian and French operas seven seasons, after which the theater was burned. In 1871 he took the Drury Lane Theater in partnership with the elder Gye, with whom he remained about two years, returning to the new building called Her Majesty's Theater, in 1877, as sole manager. In 1878 he brought an opera company to America, opening at the Academy of Music, New York, Oct. 16, with *La Traviata*. After this he came to America for several seasons, bringing such great singers as Patti, Nilsson, Gerster, Campanini, Del Puente, Minnie Hauck, Galassi, and Mme. Sealehi, and introducing many operas new to American audiences. In 1885, however, Col. Mapleson found his enterprise overshadowed by the new German company, presenting Wagner's operas at the Metropolitan Opera House, New York, and he returned to England at the close of that season. He gave concerts in the British provinces for a few months, and in 1888 he had one season of opera at Covent Garden Theater, London. In 1896 he came again to New York, and closed his career as an impresario with a series of performances in Italian by the New Imperial Opera Company, which he had formed in Italy. After a few appearances in New York and Boston the company disbanded, and he returned to England, where, during the few years before his death, he organized small concert companies from time to time, with which he toured the English provinces. His military title was due to the fact that at one time he commanded a London volunteer regiment.

Milan, ex-King of Serbia, born in Jassy in 1854; died in Vienna, Feb. 11, 1901. Milano Obrenovich was the nephew and adopted son and heir of Prince Michael, and after the assassination of the latter in 1868 he was called by the Skupshtina to succeed him as reigning Prince of Serbia. The Council of Regency which managed the public business during his minority took care to preserve the internal peace and to seek a pacific

solution of the questions pending between the principality and Turkey. Milan meanwhile pursued his studies at the Lyceum of Louis le Grand in France, where he imbibed Liberal principles. He was declared of age in 1872, and began his active reign by appointing a Cabinet of pronounced Liberal tendencies, in which Blaznavatz was president of the Council, and Ristich, a partizan of an alliance with Russia, was Minister of Foreign Affairs. Milan, who received many proofs of the sympathy of the Russian Cabinet in the quarrels of Servia with the Porte, made journeys to Vienna and Paris in the hope of obtaining from the powers the suppression of Turkish suzerainty, leaving Servia perfectly independent. A year after his marriage to Natalie Kechko, daughter of a Russian officer, he offered open defiance to Turkey, taking his directions from St. Petersburg. On July 3, 1876, the Servian troops passed the Turkish frontier, but they were disgracefully beaten in the first encounters. Gen. Tcherniaeff, the commander-in-chief, defeated at Bjelina, retreated upon Alexinatz. Milan hastily reorganized his army, but the second stage of the war was still more disastrous. After the lost battle of Alexinatz, Prince Milan had to listen to the pacific counsel of the powers and conclude a truce with Turkey. The Servians took advantage of the armistice to reorganize, and soon renewed hostilities. A succession of fresh defeats compelled Milan to negotiate directly with Turkey. Peace was concluded at Constantinople in March, 1877. The Russians intervened on behalf of the Bulgarians, obtaining the necessary aid of the Roumanians, whose territory they had to pass through, and the cooperation of the Montenegrins also. After defeating the Turkish army and concluding the peace of San Stefano, Russia was constrained to bow to the will of Europe and consent to the Berlin Congress, which drew up new terms of peace. Milan assumed the title of Sovereign Prince on March 3, 1878, and the independence of Servia, stipulated in the treaty of San Stefano, was confirmed by the treaty of Berlin. The Prince who was always defeated was proclaimed King of Servia by act of the Skupshtina on March 6, 1882. In 1885 he intervened in the Roumelian revolution, and the Servian army, under his personal command, was beaten by the Bulgarians at Tsaribrod and Dragoman. The interference of Austria-Hungary, which threatened armed intervention if the Bulgarians refused to grant an armistice, saved Milan this time from the consequences of his military disasters. In 1886, when the European concert called upon Servia, Greece, and Bulgaria to disarm and henceforth cease to endanger the peace of the world by the incessant agitation of the Balkan States, King Milan at first refused to comply with the wishes of the powers, as he had the entire Radical party of Servia at his back. A second collective note caused him to reflect, and in March he issued orders for demobilization. This was the epoch when the conflict between Russian and Austrian influence at Belgrade became acute, and Ristich and Garashanin, the respective advocates of the rival policies, took turns in the premiership. The financial and economic situation of the country suffered greatly from these sudden changes until King Milan, who in the beginning of his reign was a popular ruler, incurred the strong dislike of the majority of his subjects. Contempt and shame were felt, too, by many Servians when a vulgar domestic quarrel broke out between the King and Queen Natalie, which culminated in a divorce. The political sympathy of the Queen for Russia during the time when the King veered

around to an Austrophile policy had something to do with the estrangement, the private misconduct of Milan much more. While Natalie made an official visit to the court of St. Petersburg, the King took a political journey to Vienna, where the Emperor of Austria counseled him to seek a reconciliation with the Queen. The affair was apparently settled when suddenly, while Queen Natalie was in Wiesbaden, toward the middle of 1888, the King gave her public notice not to return to Serbia. At this time he flouted the majority of the Skupshtina, which opposed his plans for reorganizing the army. The scandal of the divorce filled the measure of his unpopularity. Queen Natalie had Prince Alexander with her at Wiesbaden, and when she received the decree of banishment she refused to be separated from her son, but by the aid of the law he was torn from her arms. Milan demanded a divorce from the Servian synod, although the bishops unanimously asserted that the synod was incompetent to pronounce the decree. The King thereupon removed the bishops and appointed a metropolitan who was willing to serve him in the matter. By this proceeding he destroyed all vestiges of prestige and respect that remained for him. He tried to break the force of the coming storm by further arbitrary expedients. When the elections resulted in an overwhelming victory for the Radicals he simply annulled them. The situation grew more critical, and on March 6, 1889, he abdicated in favor of his son Alexander, reserving for himself the regency during the minority of the new King. He scarcely attempted to exercise his rights, plunged deeper than ever into the pleasures and dissipations of Parisian life, and in 1892 renounced the regency, as he had before resigned the throne, in consideration of a sum of money voted by the Skupshtina. The Servian people to be rid of him gave him 3,000,000 francs. When this money was gone he returned to Serbia repeatedly and asserted the strong influence that he possessed over his son. Each time, with menaces and bribes combined, the Servians induced him to return to his exile. In 1898, King Alexander, having by his father's incitement, on April 13, 1893, dismissed the regents and taken up the reins of authority, recalled him and appointed him generalissimo of the Servian army. When he abdicated the throne, on Sept. 30, 1891, he renounced his titles, rank, and Servian nationality. From 1892 he was known as Count of Takovo, but after his return to Serbia he took again the name of King Milan. His divorce had been annulled, and on March 7, 1893, he was formally reconciled with his wife. His return to Belgrade and assumption of the chief command of the active army and his reassertion of a tutelage over his son caused fresh political storms. In order to avert revolution or civil war he made the Knezevich plot the pretext for imprisoning and condemning to jail or exile every politician who combated his influence. The effects of these violent proceedings opened the eyes of King Alexander at last, and he took a course similar to that which Milan had employed with Queen Natalie. While his father was sojourning abroad the young King took the occasion to announce officially his approaching marriage to the widow Draga Machin. This drew from the ex-King the expected vehement protest, upon which King Alexander simply deprived him of his rank of generalissimo and forbade him ever to reenter Servian territory. The banished King, after his fresh disgrace, began to intrigue against his son and to organize plots with the object of regaining the Crown for himself, counting on the aid of some

of the military officers who still remained faithful to him and on the support of Austria, since Alexander after his marriage had fallen under Russian influence. His unexpected death was the result of an attack of influenza which was epidemic in Vienna. Milan was the son of Miloch Yephremovich and grandnephew of Miloch, the first hereditary Prince of Serbia, who took the name of Obrenovich from his mother's first husband, was a farmer and breeder of hogs before he took the lead in the rebellion against Turkey, was recognized as Prince by the Sublime Porte in 1830, having been elected by the National Assembly in 1817, abdicated in 1839, was restored to the throne in 1858, the Karageorgevich family having reigned in the interval, and died in 1860.

Miquel, Johannes von, a German statesman, born in Neuenhaus, Hanover, Feb. 19, 1829; died in Frankfurt-on-the-Main, Sept. 8, 1901. He came from a family of French *émigrés*. He studied law at Heidelberg and Göttingen, and in the revolutionary movement of 1848 he was an ardent revolutionist of extreme views, an atheist, and a Socialist, who proposed to lead a peasant's revolt. As soon as Germany was reduced to something like the old order under the old rulers, who had the military, when he saw that the path to greatness through revolution was closed, if he did not forget his Marxist ideals, he hid them in his mind, and studied the means of entering political life under the conditions that he found. While practising law he was studying politics, and when struggling for bread he aimed to be minister. He was elected to the Hanoverian Diet first in 1864, after having won a high reputation as an advocate in Göttingen. As Bürgermeister of Osabrück in 1865 he exhibited remarkable administrative ability. In the Hanoverian Diet he made himself a master of finance, and his disclosures of the mismanagement under the Guelphs spread his fame throughout Germany. All Germany was the sphere of his political hopes and plans. With Bennigsen he founded the National German Union which set forth the means and conditions of accomplishing the unification of Germany. Their program was accepted by the practical politicians of all the states, so that when Prussia annexed Hanover it was said that Hanover had annexed Prussia. His parliamentary and political reputation was already established when he entered the Prussian Chamber, and his services in having smoothed the way for the incorporation of Hanover gave him a position of importance in the Diet and afterward in the Reichstag, which he turned to good account. He was one of the most loyal and useful of Bismarck's lieutenants, carrying a doubtful vote oftentimes by his facts, arguments, and eloquent appeals. He was chairman of the Committee on the Reform and Unification of Judicial Procedure, and this great work was in a great measure his. In 1869 the Berlin Discontogesellschaft engaged him as legal director, but after four years he gave up the position in order to devote himself entirely to legislative labors. In 1882 he accepted the office of head Bürgermeister of Frankfurt, and for eight years he administered the affairs of that city to the satisfaction even of the burghers who were bitterly opposed to him in politics. The post made him *ex officio* a member of the Prussian House of Lords, in which he gave serviceable aid to Prince Bismarck in bringing to an end the Kulturkampf. In 1884 he pressed upon the National Liberals a program involving a compromise with political and economic theories with a view to their coming into office by absorbing the Moderates of other parties. His plan was successful,

and yet its author was repudiated as a leader. The young Kaiser, however, needed a man to counterbalance the influence of the Conservatives and to stand before the country as a pledge that no purely reactionary policy would be followed. Therefore Miquel was appointed Prussian Minister of Finance, and was known throughout Germany as the Kaiser's man. Finance was his own peculiar branch, and in Prussia there was a peculiar opportunity to display both his constructive ability and his political adroitness. His management of the finances was remarkably able, sound, and safe, and in proportion as it preserved and enlarged the pecuniary resources of the Government his own political power and authority increased. His planned reforms were far more original and important, and of such magnitude that he was able to accomplish only a small part of the task he set before himself. He endeavored to make the imperial treasury independent of the finances of the individual states, but the increase of the bourse tax and some new stamp duties were all the new resources he succeeded in unlocking, as he encountered the opposition of the Center. In reforming the Prussian system of taxation he was more successful, but only by adapting his plans to the demands of the Agrarians, and in becoming their instrument he sought to make them the instrument for his elevation to the chancellorship. The direct income tax was made more productive by imposing on taxpayers the responsibility of assessing their own incomes, by making the rate of progression much steeper, and by imposing an additional tax on incomes from investments. Communal taxes were readjusted for the relief of overtaxed communities, and the taxes on land, buildings, and trades were surrendered for the benefit of all, the trade tax being altered to the advantage of small industries. For completing the railroad network and for mines, canals, and all reproductive works and public improvements from which he could calculate a future increase of revenue, Miquel could find any amount of money; to all proposals for temporary relief or for increasing current expenses he was obdurate, saying, when the surplus mounted up, that he must be ready for lean years to come. He would not give doles even to the Agrarians, although the political subservience to them of the old National Liberal leader, and to the Conservatives in their educational and general reactionary policy, and to the Kaiser in all his whims, furnished a curious example of political opportunism. In abandoning his convictions he abandoned also his prudent self-restraint and practical sagacity. He grasped at the reward for so great a sacrifice, and by his sly intrigues to upset Caprivi, Hohenzollern, and Bülow, his ambition growing more restless and reckless with each disappointment, he plunged the Government into chaos, lost his control over the Prussian Chamber when he tried to force through the Elbe Canal bill to please the Emperor, or perhaps only pretended to try. After the third rejection of this measure, which he probably as a financier inwardly condemned, he had to lay down his office only three months before his death.

Monkhouse, Harry (real name, John Adolph Mekie), English actor, born in Newcastle-on-Tyne, March 17, 1854; died in London, Dec. 18, 1901. He made his first appearance at Blyth, England, in October, 1871, at Tyne's Theater. After four years' experience on the provincial circuits he made his London debut at the Elephant and Castle, where he remained until the theater was burned, three years later. After brief engagements at the Victoria and the Marylebone

Theaters, he went to the Grecian Theater, where he played low-comedy rôles for three years. His next important engagement was at the Gaiety Theater, Nov. 1, 1882, in *More than Ever*; after which he acted in *Fra Diavolo*, also in *Blackboard* and in *Ariel*. He then became the star in a highly successful play called *Larks*, which ran for three years. In 1888 Mr. Monkhouse leased the Tyne Theater, Newcastle, and played there for three months in a repertoire of Dion Boucicault's Irish dramas. He then returned to London and became a member of Carl Rosa's Opera Company, opening at the Prince of Wales's Theater, Jan. 12, 1889, in the opera of Paul Jones, in which Mr. Monkhouse made a great hit as Bouilleteise. He afterward scored another notable success in *The Rose and the Ring*, in 1890, at the Prince of Wales's Theater, under the management of Horace Ledger; after which, under the same management, he played important rôles in *Maid Marian*, *La Cigale*, *Poor Jonathan*, *The Mountebanks*, and *The Magic Ring*. In 1893 he was engaged by George Edwardes to play Dr. Brierly in *A Gaiety Girl* at the Prince of Wales's Theater, and his success in that rôle was so pronounced that his services were secured for the American tour of that popular musical comedy. He appeared in New York at Daly's Theater, Sept. 18, 1894, and became a favorite with metropolitan theatergoers. When the Edwardes company returned to England in the spring of 1895, Mr. Monkhouse assumed the leading rôles in *The Shop Girl*, *An Artist's Model*, and *The Geisha*. After this he leased the Art Theater, at Newcastle, for a time, and then appeared again in London in *The Circus Girl* and *A Runaway Girl*. These engagements were followed by another tour in *Larks*, his early triumph, and an appearance in the pantomime *Cinderella*, at Manchester. He then rejoined the Edwardes company, to play *Hooker Pasha* in *A Messenger Boy*, and the *King of Illyria* in *Kitty Grey*. His last appearance was in *Florodora*, in which he played Anthony Tweedlepunch. Mr. Monkhouse was the author of several bright comedies and sketches; he also wrote the libretto of a comic opera, *La Rosière*, produced at the Shaftesbury Theater in 1893. His last work was a pantomime arranged for Paul Martinetti. He was one of the greatest favorites of the modern English stage and was equally popular in private life; he had a commanding presence and a fine voice, and was a celebrated *raconteur*.

Monkhouse, William Cosmo, an English author, born in 1840; died in Skegness, Lincolnshire, England, July 20, 1901. He was educated at St. Paul's School, London, and in 1857 entered the Board of Trade Office as a junior clerk, remaining in the service of that institution until his death, at which time he had been for several years a secretary in the financial department. Among the minor English poets of the Victorian era he occupied an honored place, and he won some prominence as an art critic. Besides contributing 137 articles to the *Dictionary of National Biography*, practically covering the whole field of English art, he published *A Question of Honor*, a novel (1868); *Masterpieces of English Art* (1868); *The Works of John Henry Foley* (1875); *Sir Charles Eastlake* (1877); *Sketches by Sir Edwin Landseer, with a History of his Art Life* (1877); *Key to Exercises in the Précis Book* (1877); *Turner, in the Great Artist Series* (1879); *The Italian Pre-Raphaelites* (1887); *The Earlier English Water-Color Painters* (1890); *Leigh Hunt, in Great Writers Series* (1893); *In the National Gallery* (1895); *British Contem-*

porary Artists (1899); and the following volumes of verse: *A Dream of Idleness* (1865); *Corn and Poppies* (1890); *The Christ upon the Hill* (1895). He will be best remembered for his services to art.

Moreau de Tours, Georges, a French painter, born in Ivry, in 1848; died in Bois le Roi, Jan. 17, 1901. He was a pupil of Marquerie and Cabanel in the *École des Beaux Arts*, became a member of the Society of French Artists, and obtained his second medal in 1879. The majority of his works have been purchased by the French Government, among them *Le Drapeau*, in the *Élysée*, and the *Death of Vaneau*, in the *École Polytechnique*. Some of his best-known canvases are *L'Extatique*, *Death of Pichegru*, *Departure of the Conscript*, *Le Cabaret*, and *Evocation*.

Morris, Michael, Baron of Killanin, an Irish jurist, born in Galway, Nov. 14, 1827; died there, Sept. 8, 1901. He was descended from an ancient Irish family, was educated in Trinity College, Dublin, graduating with honor in 1847, called to the bar in 1849, made a Queen's counsel in 1863, elected to Parliament as a Conservative in 1865, appointed Solicitor-General for Ireland by Lord Derby in 1866, becoming Attorney-General a few months later, and made a puisne judge in 1867, Chief Justice of Common Pleas in 1876; and Lord Chief Justice of Ireland in 1887. He was created a baronet in 1885, and received a hereditary peerage on retiring from the bench in 1900. His advancement was due to his being a Catholic and to his popularity in Galway, to which his genial humor and ready wit contributed, rather than to his political or his legal ability.

Myers, Frederic William Henry, an English author, born in Duffield, Derbyshire, Feb. 6, 1843; died in Rome, Italy, Jan. 17, 1901. He was the son of the Rev. Frederic Myers, a writer of note, and received his education at Cambridge. He was classical lecturer at Trinity in 1865-'69, and held the post of school inspector from 1872 until his death. He was one of the founders in 1882 of the Society for Physical Research, which aimed to collect evidence and to carry on systematic experiments in hypnotism, thought transference, and clairvoyance, and he contributed a long series of papers on the Subliminal Self to the Proceedings of the society. At the time of his death he was president of the society and had been its honorary secretary for a long period. His writings in book form include *Saint Paul*, a poem (1867); *Poems* (1870); *Wordsworth*, in *English Men of Letters Series* (1880); *The Renewal of Youth and Other Poems* (1882); *Essays Classical* (1883); *Essays Modern* (1883); *Science and a Future Life* (1893); *Human Personality and its Survival of Bodily Death* (1901). With E. Gurney and F. Podmore he published *Phantasms of the Living*, in 1886. Myers's essays display much literary strength as well as a finished style, and he is worthy of remembrance as a poet also.

Nordenskiöld, Baron Adolf Erik, explorer and cartographer, born in Helsingfors, Finland, Nov. 18, 1832; died Aug. 12, 1901. His ancestors came originally from Sweden, several of them being noted for their scientific work. His father, Nils Gustav, was an accomplished mineralogist, and in 1824 became head of the Mining Office in Finland. His early education was conducted by private tuition. He was then sent to a gymnasium, to prepare for the university, where, in the rector's words, he distinguished himself "only by absolute idleness." He, however, entered the University of Helsingfors in 1849, where he gave special attention to chemical and mineralogical work. He spent his vacations in geological excursions, and in 1853 visited the Ural mountains

with his father. He had obtained salaried appointments at both the University and the Mining Office; but he aroused the suspicion of the Russian authorities, and these were suddenly withdrawn. He now went to Berlin and worked in Rose's laboratory at mineral analysis.

Next year he returned to Finland and obtained the Alexander traveling stipend of the Helsingfors University. At a university meeting where he was to have received his doctor's degree before setting out on his travels he again incurred the suspicion of the Russian officials, and was forced to leave the country. He settled in Stockholm in the winter of 1857-'58, and although the prohibition to visit Finland was eventually withdrawn he continued to live in Sweden. In the spring of 1858 he accompanied the first expedition of the Swedish geologist, Otto Torell, to Spitzbergen, which proved very successful, and returned with much important scientific material. At Bell Sound, Nordenskiöld discovered the remains of several tertiary plants, whose study led to important new conclusions regarding the early climatic conditions of the region. Upon the return of the expedition Nordenskiöld was made professor and curator of the mineralogical department of the Swedish Riksmuseum. In 1861 he accompanied Torell's second Spitzbergen expedition, which also brought back material of great scientific importance. In 1864, at the request of the Swedish Academy, he took command of an expedition for testing the practicability of the measurement of an arc of the meridian, as suggested by the president of the Royal Society of London. Much valuable botanical and zoological material was obtained during this voyage; but, although an attempt was made to reach a high northern latitude, it was not successful. In 1867 the iron steamer *Sofia* was placed at Nordenskiöld's disposal, and in her he subsequently attained a latitude of 81° 42' N., the most northerly point that at that time had been reached in the eastern hemisphere. In 1870 he was able, through the munificence of Oscar Dickson, to begin the organization of a large expedition to Greenland. He set out during this year on a preliminary exploration. The vast inland ice-sheet of Greenland was for the first time trodden by a scientific observer; and its scanty vegetation of algæ was described by Dr. Berggren. The second and main expedition did not start until 1872. It was unexpectedly caught in the ice, with several walrus sloops, and its store of provisions was used up in feeding their inmates. In 1875 Mr. Dickson furnished the money for an expedition up the Yenesei river to Yeniseisk. This and several subsequent expeditions to neighboring regions finally led to the inauguration of the most important geographical work with which Nordenskiöld's name is connected—the voyage of the *Vega*, which accomplished the northeast passage. The *Vega* left Karlskrona on June 22, 1878, doubled the most northerly point

of the Old World, Cape Chelyuskin, in the following August, and approached within 100 miles of Bering strait, where she was frozen in the ice in September, and forced to winter in the arctic. The voyage was successfully continued during the following summer, and on Sept. 2, 1879, Nordenskiöld dropped anchor at Yokohama, and announced to the world that the dream of hundreds of daring explorers during three centuries was an accomplished fact. Nordenskiöld's last expedition was that to Greenland in 1883. During his later years he devoted much attention to the early history of cartography and published two large works on the subject.

Nyssens, Albert, a Belgian statesman, born in Ypern, June 20, 1855; died in Brussels, Aug. 21, 1901. He studied law in Ghent, Paris, and Bologna, and made a reputation by his works on jurisprudence. In 1881 he founded an association for proportional electoral representation. He was appointed Professor of Commercial and Fiscal Law at the University of Louvain in the same year. In 1892 the town sent him to the Chamber, where he had an important share in revising the state Constitution. When the parties could not agree in 1893 on the electoral law, and the working men went on a general strike as a demonstration in favor of universal suffrage, he proposed his own system of proportional representation, and it was adopted as a compromise by an almost unanimous vote. People nicknamed him Father Plural after that because it introduced plural voting for heads of families and men of education or of property. From May 23, 1897, till Jan. 24, 1899, he was Minister of Commerce and Labor. He proposed a law for the protection of working men modeled on the German act, which was defeated by the Clericals, driving him from office. He returned to his chair in the university and continued in speech and writing to influence public opinion on burning political questions, being a Liberal of the school of Beernaert, although he had held office in a Clerical Cabinet. His death was the act of his own hand.

Oliver, Edward Emmerson, an English civil engineer, born in 1843; died in Boscombe, Hampshire, Nov. 24, 1901. He entered the East Indian public works department in 1868, becoming assistant secretary to the Punjab Government in that department in 1883, and was later transferred to a similar post in the Central Provinces, soon becoming chief secretary, and retiring in 1899. He wrote *Reh Swamp and Drainage*; *The Decline of the Samanis and the Rise of the Ghaznaris*; *Coal and Iron in the Punjab*; *The Chagatai Mughals*; *The Safaris in Persia*; *Coins of Akbar in Karegra*; *Coins of the Mohammedan Kings of Gujrat*; *Across the Border, or Pathan and Baluch* (1890).

Orleans, Prince Henry of, born in Ham, England, Oct. 6, 1867; died in Saigon, Indo-China, Aug. 9, 1901. He was the elder son of the Duc de Chartres, the second son of the Count of Paris, son and heir of Louis Philippe, King of the French. In July, 1883, he started out with Gabriel Bonvalot, the explorer, and journeyed through Siberia and Tibet to Tonquin, earning the medal of the French Geographical Society. He was about to enter the military college of St. Cyr, when he was excluded by the law of 1886 against pretenders. In September, 1887, he went to India, joined the Duke of Orleans, his uncle, in a tiger hunt in Nepal, and visited Bombay, Agra, Delhi, Lahore, Afghanistan, Calcutta, Madras, Ceylon, and subsequently Japan. In 1891 he went to Abyssinia, making the first map of Harrar; then visited China, and made explo-

rations in Tonquin, Laos, and Siam, bringing back collections which were exhibited in Paris. In 1894 he made a journey to Madagascar, and afterward proceeded to Saigon, from where he made excursions into Yunnan and Tibet, exploring the upper Irrawaddy and discovering its source, not returning to France till February, 1896. In 1897 he revisited Abyssinia, and on his return the Count of Turin went to France to demand satisfaction in the name of the Italian army, officers of which who were in captivity in Abyssinia Prince Henry had disparaged. The two princes fought a duel, in which both were wounded. He revisited Abyssinia again in 1898. His visits to that country had political aims. He cooperated with the Russian Leontieff, with whom he had a difference later, and he quarreled with M. Bonvalot because the latter, holding official relations with the French Government, would not join him in an attempt to push forward to the Nile to meet the Marchand expedition from the Congo. Prince Henry in all the recent phases of Anglo-French colonial disputes and rivalry was one of the most ardent and extreme defenders of French claims, and by his active participation in forwarding French pretensions and his zeal in advocating them and in pointing out objects of colonial ambition and the means of attaining them in communications to the press, illumined by knowledge he had gained on the spot as an explorer, he gave more offense than any other writer or politician to the English, who accused him of ingratitude toward the country that had extended hospitality to his family in its exile. In the Siamese troubles and the discussion over a buffer state between Burma and Indo-China his elucidations were most intelligent. The French Government entrusted him with no missions and treated his activity with studied indifference, because his political ambition was apparent, but rewarded his services with the cross of the Legion of Honor. He declared his acceptance of the republic if the French people in the exercise of their sovereign right chose definitely that form of government. The renown and popularity that he won as a patriotic explorer placed him in the position of a rival to his cousin, the Duke of Orleans, in whom the Legitimist and Orleanist claims are now united. Prince Henry did not aim to be King, but could not conceal his hopes of advancing to greatness through a popular movement, perhaps of becoming a plebiscitary President. His relations with the Nationalists and his conduct throughout the Dreyfus affair betrayed his ambition, however adroitly he sought to conceal it, and so did his manifestations of sympathy with the Boers in their war with England. When the troubles in China occurred he begged President Loubet to allow him to accompany the French expedition in a civil capacity since as a member of a dynastic family he was precluded from serving in the army or navy. His request was not granted. In March, 1901, he went to Anam, and in journeying in the interior was seized with a tropical malady to which he eventually succumbed. He published an account of his great journey through Tibet under the title *De Paris au Tonkin à travers le Tibet inconnu*.

Ormerod, Eleanor A., an English entomologist, born in Gloucestershire, May 11, 1828; died in St. Albans, July 19, 1901. She was the daughter of a genealogist and country gentleman. From childhood she had a passion for observing insect life, and when her father grew old and left to her the care of his land she acquired a practical knowledge of agriculture. She took up

the special subject of agricultural entomology, got the farmers and laborers of the estate interested in helping her to collect specimens of injurious insects and of their mischievous work, learned what they could tell her of the subject as well as what was recorded in books, and when the Royal Horticultural Society and the British Government began in 1868 to make a collection of noxious and beneficial insects she contributed what she had and continued to collect with more ardor for ten years. She also made models of insect injuries, which spread her reputation in many countries. She conceived the idea of collecting statistics of insect ravages, which could only be done by the voluntary cooperation of observers in all parts of the country. In a pamphlet entitled *Notes for Observation on Injurious Insects* she unfolded her scheme in 1877, and in the autumn of that year she had enough data to issue a record, which was completed in succeeding years. These annual reports were published as long as she lived. In 1899 a general index was printed of the 22 reports issued up to that year. In 1881 she issued a special report of the ravages of the turnip-fly, which had been very destructive in that year. In 1882 she accepted the appointment of honorary consulting entomologist to the Royal Agricultural Society, which desired her aid in view of the serious and increasing attacks of insects on farm crops. Her reports printed by this society ceased in 1891 in consequence of a disagreement. Information and advice were sought from her and observations and specimens were sent to her from nearly every country in the world until in the spring of 1901 she determined to give up her entomological work. She was engaged in writing a book of *Reminiscences* in the last months of her life. The principal books that she published are *Manual of Injurious Insects*, *Handbook of Insects Injurious to Orchards and to Bush Fruits*, *The Cobham Journals*, *Guide to Methods of Insect Life*, *Injurious Insects of South Africa*, *Text-Book of Agricultural Entomology*, and *Flies Injurious to Stock*. She issued special reports on the Hessian fly, which she was the first to detect in English wheat-fields in 1886, and on the wireworm, the hop aphid, the mustard beetle, and other insect pests, after first sending out circulars of inquiry relating to them. When the ox-warble fly, the eel-worm, and other dangerous insects made their appearance she sent out circulars at her own expense warning farmers how to detect and how to destroy them or how to keep them away. Her investigations into the habits of the warble-fly were the means of saving the cattle-herds of various countries from a serious danger.

Pallavicini di Priola, Marquis Emilio, an Italian soldier, born in Genoa in 1824; died in Rome, Nov. 18, 1901. He left the military academy of Turin with the grade of 2d lieutenant, served in the campaigns of 1848 and 1849 with an infantry regiment, was transferred to the bersaglieri, and as commander of a battalion displayed signal gallantry in the storming of Sebastopol. In the campaign of 1859 he distinguished himself by his bravery, and for his conduct in the battle of San Martino he received the cross of the military order of Savoy. As major commanding a battalion of bersaglieri he drove the Swiss Pontifical Guards out of Perugia on Sept. 14, 1860, received promotion to a lieutenant-colonelcy, and for the capture of Capua and Ancona a gold medal and a colonel's commission. The Government ordered him to Catania to oppose the volunteers who were marching under Garibaldi upon Reggio, and at Aspromonte he took Garibaldi

prisoner. As major-general he was sent to repress brigandage in the south. Afterward he was lieutenant-general commanding army corps at Palermo and Rome, and on the death of Gen. Posi became aide-de-camp to King Humbert. He sat in the Senate from 1880.

Parodi, Alexandre, a French dramatist, born in Canea in 1840; died in Paris, June 23, 1901. He was a son of the Sicilian consul in Crete, became a naturalized Frenchman, resided successively at Milan, Smyrna, Geneva, and finally Paris, where he obtained a post in the prefecture of the Seine. He wrote letters for Italian newspapers, and his poetic style in French was not elegant, but he had a talent for the drama and the gift of producing strong and novel situations. After publishing *Passions et Idées* (1865) and *Nouvelles Messéniennes* (1867), two books of verse, he brought out in 1870 a drama in five acts, *Ulm le Paricide*, which critics pronounced a vigorous work. His *Rome Vaincue*, in 1876, brought celebrity. Yet for years afterward his pieces were refused by the managers, and he had them printed. In 1893 success came again when *La Reine Juana* was played at the Renaissance Theater. He wrote a political romance, *Le Dernier des Papes*, and *Le Pape*, a dramatic poem, in later years. In 1888 he published a volume of criticism on the French drama.

Paton, Sir Joseph Noel, a Scottish painter and poet, born in Dunfermline, Dec. 13, 1821; died in Edinburgh, Dec. 26, 1901. He was admitted to the Royal Academy as a student in 1843, and exhibited his first picture, *Ruth Gleaning*, at the Scottish Royal Academy in 1844. The next year he displayed two pictures there, and obtained a prize of £200 for a cartoon exhibited at Westminster Hall. He was admitted A.R.S.A. in 1847, and full R.S.A. in 1855. He was appointed her Majesty's limner for Scotland in 1866, and was knighted in 1867. His latest pictures were *Vade, Satana*; *Ezekiel's Vision of Dry Bones* (1893); *Oberon and Titania*; *By the Still Waters* (1894); *Puck* (1897); and *Queen Margaret reading the Bible to Malcolm Caenmore* (1900). Paton's pictures were very popular and exerted a strong influence upon persons not usually affected by pictorial art. He was eminent also as an archaeologist, and was the author of *Poems by a Painter* (1861); *Spindrift*, a volume of verse (1867).

Petit, Sir Dinshaw Manockjee, an Indian philanthropist, born in Bombay, June 30, 1823; died there, May 5, 1901. He belonged to a family of Parsee merchants. His grandfather had taken the cognomen Petit from the French on account of his short stature. Dinshaw was trained in the office of an English merchant and in his father's business. When the civil war in the United States broke out he invested 1,250,000 rupees, which he inherited from his father in 1859, in cotton plantations, which yielded immense profits during the cotton famine in Lancashire. Later he built mills in all parts of Bombay. He founded and endowed a hospital in Bombay, another for animals, a female college, a technical institute, and a hospital for lepers, dividing his benefactions between the sick, women, and dumb animals. He gave the land for Elphinstone College, and in Bombay and Surat he built drinking fountains, fire temples, and towers of silence.

Pettenkofer, Max von, a German physiologist, born in 1819; died in 1901. He elaborated with Karl Voit a respiration apparatus for measuring the chemical action in the lungs, and demonstrated that the production of carbonic acid varies between sleeping and waking. He drew attention to the importance of ventila-

tion in closed rooms and published tests for determining the degree of foulness in the air. He experimented with stone and other building materials and discovered that walls are pervious to air if they are dry, but not if they are wet, and to this he attributed partly the unhealthfulness of damp dwellings. The influence on health of the air exhaled from the soil engaged his attention, and he found that organic decay and the generation of carbonic-acid gas occurs near the surface of the ground and diminishes rapidly with the depth. He studied the variations of dampness in the soil and tried to connect them with outbreaks of cholera. His title of nobility was conferred on him in 1883 for his services in founding the science of hygiene.

Pi y Margall, Francisco, a Spanish politician, born in Darna in 1825; died in Madrid, Nov. 28, 1901. He wrote art criticisms while studying law in Madrid, became an ardent Republican politician, was elected Deputy for Darna in 1869, composed the proclamation establishing the republic on Feb. 11, 1873, became Minister of the Interior, and on June 8, 1873, President of the republic. As President he signed decrees for the separation of Church and state and the abolition of slavery in Cuba. After he was succeeded on July 18, 1873, by Nicolas Salmeron he was shot at by the priest Pollete. He held himself aloof from politics in the reign of Alfonso XII until, in 1880, he founded the Federalist party, of which he was the parliamentary leader after his election to the Chamber in 1886.

Powlett (Stanhope) (Primrose), Catherine Lucy Wilhelmina, Duchess of Cleveland, born June 1, 1819; died in Wiesbaden, Germany, May 18, 1901. She was the only daughter of the fourth Lord Stanhope, and in her youth was called one of the most beautiful women in England. She was one of the train-bearers at the coronation of Queen Victoria in 1838, and one of the Queen's bridesmaids in 1840. She married her first husband, Lord Dalmeny, son of the fourth Earl of Rosebery, in 1843, and was left a widow in 1851, when her son, the present Lord Rosebery, was but four years old. In 1854 she married Lord Harry Vane, who succeeded to the dukedom of Cleveland and took the name of Powlett. At his death in 1891, the dukedom became extinct, but Battle Abbey, the family seat, remained in the possession of the duchess during her life. The duchess was an enthusiastic traveler, and took an active interest in affairs. In 1889 she published *The Battle Abbey Roll: With Some Account of the Norman Lineages*, in 3 volumes. In this work, the result of much patient research, the author distinguishes between names properly belonging to the roll of the knights of William the Conqueror and those added subsequently.

Pretorius, Marthinus Wessels, a South African statesman, born in 1827; died in Potchefstroom, May 19, 1901. He was the son of Andries Pretorius, one of the leaders of the great trek, who in 1848, when the British seized Bloemfontein and declared the annexation of the Orange Free State, compelled the British garrison to surrender, but was driven across the Vaal when Sir Harry Smith brought up a British force. He died after signing of the Sand river convention by which Great Britain recognized the independence of the Transvaal, and his son Marthinus succeeded him as commandant-general and continued his policy, the aim of which was to unite the Boer republics. He invaded the Free State with the Potchefstroom commandos in 1857, but was unsuccessful. In 1860 he was elected President of the Free State, and still could not carry

out his plans. When all the Boers north of the Vaal came together and established the South African Republic in 1864, Pretorius left the Free State to become their first President. The Baralong tribes in the west, incited and armed by British missionaries, declared their independence and drove out the Boer settlers. After chastising them more than once, when the trouble broke out again President Pretorius accepted the arbitration of the Governor of Natal. To the consternation of the Boers, Gov. Keate decided against their right to the territory, although they had originally settled the Baralongs there on a tenure of service. He had been reelected in 1869, but the Keate award ruined his chances for the next term. His successor, President Burgers, by undertaking improvements in education and public works, leading to financial difficulties, and by his advanced views brought on civil dissensions which led in 1877 to the occupations of the towns by the British and the proclamation by Sir Theophilus Shepstone of the annexation of the Transvaal to the British Empire. Pretorius joined with Kruger and Joubert in rousing the Boers to resist annexation, but after they had regained independence in 1880, Paul Kruger, who had been their most efficient military chief as well as the most active political leader, was elected President when a regular Government succeeded in 1881 to the triumvirate.

Roberts, Alexander, a Scottish clergyman, born in Kincardineshire, May 12, 1826; died in March, 1901. He was educated at King's College, Aberdeen, and, entering the Presbyterian ministry, held pastorates in Scotland and London in 1852-'71. In the year last named he succeeded Principal Shairp as Professor of Humanity at St. Andrew's University, and he was professor emeritus at the time of his death. He was a member of the New Testament Revision Company in 1870-'81. His great aim in life was to convince the world that Christ in his public teaching habitually used Greek. Prof. Roberts published *The Threefold Life* (1858); *Inquiry into the Original Language of St. Matthew's Gospel* (1859); *Discussions on the Gospels* (1862); *Life and Works of St. Paul* (1867); *Writings of Irenæus and Hippolytus*, translation (1868); *The Bible of Christ and his Apostles* (1879); *Companion to the Revised Version of the English New Testament* (1881); *Old Testament Revision: A Handbook for English Readers* (1883); *Greek the Language of Christ and his Apostles* (1888); and *A Short Proof that Greek was the Language of Christ* (1893).

Robinson, Frederick, an English novelist, born in London, Dec. 23, 1830; died there, Dec. 6, 1901. He was all his life a resident of London, and besides being a prolific writer of novels was a frequent contributor of special articles to periodicals, and for five years dramatic critic on the *Daily News*. He founded the *Home Chimes*, which ran as a weekly for two years, and was then issued as a monthly. He was greatly beloved among his fellow craftsmen in literature, being wholly without envy and invariably generous in his recognition of the merits of others. His plots are skilfully constructed and his stories, which are fluently told, are always entertaining. He was the last of the more important "three-volume" novelists, and with the final extinction of that form of issue he published at less frequent intervals than before. A nearly complete list of his works is believed to be as follows: *The House of Elmore* (1855); *Wildflower* (1867); *One-and-Twenty* (1858); *Woodleigh* (1859); *High Church* (1859); *Grandmother's Money* (1860); *Twelve*

o'clock (1861); No Church (1861); Owen: A Waif (1862); Slaves of the Ring (1862); Female Life in Prison, by a Prison Matron, a very remarkable example of realistic fiction (1862); Jane Cameron (1863); Church and Chapel (1863); Mattie: A Stray (1864); A Woman's Ransom (1864); Carry's Confession (1865); Mr. Stewart's Intentions (1865); Milly's Hero (1866); Prison Characters (1866); Beyond the Church (1866); A Fight for Life (1866); No Man's Friend (1867); Ann Judge, Spinster (1867); Poor Humanity (1868); For Her Sake (1869); Stern Necessity (1870); True to Herself (1870); Wayford's Ward and Other Tales (1872); A Bridge of Glass (1872); Her Face was her Fortune (1873); Little Kate Kirby (1873); Second-Cousin Sarah (1874); As Long as she Lived (1876); The Romance of a Back Street (1878); Coward Conscience (1879); Poor Zeph, and Other Tales (1880); Othello the Second (1880); The Black Speck: A Temperance Tale (1881); Women are Strange, and Other Stories (1883); The Hands of Justice (1883); The Man she Cared For (1884); Lazarus in London (1885); A Fair Maid (1886); The Courting of Mary Smith (1886); In Bad Hands, and Other Tales (1887); A Dark Secret (1887); The Youngest Miss Green (1888); A Very Strange Family (1890); The Keeper of the Keys (1890); Her Love and his Life (1891); The Wrong that was Done (1892); The Fate of Sister Jessica, and Other Tales (1893); Under the Spell (1894); The Secretary (1895); Sweet Nineteen (1896). Many of Robinson's novels were reprinted in the United States, where his popularity was at one time equal to the favor he had won at home.

Rummel, Franz, a German musician, born in 1853; died in Berlin, May 3, 1901. He was a pupil of Liszt and a remarkable virtuoso who made many tours in the United States, on one of which, in 1898, he was taken ill and had to give up playing in public. He married the daughter of Prof. Morse, the electrician.

Salaman, Charles Kensington, an English musical composer, born in London, March 3, 1814; died there, June 23, 1901. He studied in the Royal Academy of Music and with Charles Neate in London and Herz in Paris, gave piano recitals in London till 1837, resided in Rome and other Continental cities, reappeared in London in 1850, began to give musical lectures in 1855, and formed a musical society in 1858. He composed innumerable songs and pieces for the pianoforte from the age of fourteen. He set songs in Hebrew and Greek as well as in English and other modern languages, and always aimed to convey the natural rhythm and accent of the spoken words.

Schamdorf, Sophus, a Danish poet, born in 1837; died in Ringsted in January, 1901. He published volumes of verse, humorous and pathetic, and novels of country life in Denmark, literary studies of Goldoni and Gozzi, and translations of the poetry of Leopardi, Manzoni, and other Italians.

Schenk, Auguste, a French painter, born in Glückstadt, Holstein, April 23, 1828; died in Ecouen in January, 1901. He was educated for mercantile life, traveled in England and Portugal, then went to Paris, studied art with Léon Cogniet, made his mark at the Universal Exposition of 1855, exhibited at every Salon, was made chevalier of the Legion of Honor in 1855, and at the exposition of 1889 his canvases were still admired, but later he faded from public notice. He painted landscapes with animals, flocks of sheep in the mountains in the midst of storms, and critics have never ceased to recognize his talent.

Schwarzkopf, Julius Karl von Gross von, a German soldier, born in Magdeburg in 1850; died in Pekin, April 17, 1901. He was the son of Gen. von Schwarzkopf, became an ensign in the Prussian foot-guards just previous to the Franco-German War, in which he was promoted lieutenant and won the Iron Cross for bravery. He was Prussian *attaché* at Paris at a critical period, commanded a regiment in 1897, and was sent to the Peace Conference at The Hague as German representative. His remarkable speech against the Russian proposal of gradual disarmament had a great effect and won him promotion to the rank of major-general. He commanded a brigade in the expedition to China, and on arriving there was relieved of this command in order to act as chief of staff to Count von Waldersee. He lost his life in trying to rescue the archives of the staff in a fire in the Winter Palace.

Siemens, Georg von, a German financier, born in Torgau in 1839; died in Berlin, Oct. 23, 1901. His father was a lawyer, and the son studied law at Heidelberg and Berlin. He served gallantly in the Austrian and French wars as an infantry officer, winning the Iron Cross for his conduct at Mars la Tour. After returning to civil life he traveled in all parts of the world in connection with the business of his cousins, the electricians, and then became a director in the Deutsche Bank of Berlin shortly after it was started, and in the development of that great financial institution he took the foremost part. Its objects were to free German foreign commerce from its dependence on London for facilities of credit and exchange, and to afford to the German markets and industries sufficient support to enable them to bear the stress of commercial crises at home and escape being swamped by crises abroad through the withdrawal of foreign capital. As the bank expanded, branches were established in Bremen and Hamburg, in London and Paris, in the United States, in South America, and later in Shanghai and Yokohama. This was his work. The enormous amount of foreign bills that the bank put out alarmed German merchants at first, but when they saw that it not only extended its business with extraordinary rapidity, but passed through commercial crises in which older concerns went down, they came to regard it as the strongest financial institution in Germany, and thus it was able to establish prosperous agencies in all parts of the empire. In Mexico it cooperated with American financiers in the conversion of the debt and the development of the country. It became the financial agent of the German Government and the instrument by which German enterprise in distant regions and German political policy were linked together. One of the latest and greatest enterprises which Dr. von Siemens carried out was the building of the Anatolian railroads in Asia Minor.

Silvestre, Paul Armande, French author, born in Paris, April 18, 1837; died in Toulouse, Feb. 21, 1901. He was educated at L'École Polytechnique, in Paris, and for nearly forty years was before the public as journalist, art critic, poet, and dramatist, as well as the extraordinarily prolific author of somewhat Rabelaisian stories. His verse includes *Rimes Neuves et Vieilles* (1866); *Les Renaissances* (1870); *La Gloire du Souvenir*, a poem of love (1872); *La Chanson des Heures*, 1874-'78 (1878); *Les Ailes d'Or*, 1878-'80 (1880); *Le Pays des Roses*, 1880-'82 (1882); *Le Chemin des Étoiles*, 1882-'85 (1885); *Roses d'Octobre*, 1884-'89 (1889); *L'Or des Couchants*, 1889-'92 (1892). The larger number of his collections of stories include *Les Malheurs du Commandant*

Laripètre (1881); *Les Forces de mon ami Jacques* (1881); *Les Mémoires d'un Galopin* (1881); *Le Péché d'Ève* (1882); *Pour faire rire* (1882); *Le Fillène du Docteur Trousse cadet* (1882); *Madame Dandin et Mademoiselle Phryné* (1883); *Les Bêtises de mon Oncle* (1883); *Contes Grassouillets* (1883); *Chroniques du Temps Passé, le Comte de l'Archer* (1883); *En Pleine Fantaisie* (1884); *Contes Pantagruéliques et Galants* (1884); *Le Livre des Joyeusetés* (1884); *Histoires Belles et Honnêtes* (1884); *Le Dessus du Panier* (1885); *Contes de Derrière les Fagots* (1886); *Histoires Inconvenantes* (1887); *Contes Incongrus* (1887); *Le Livre des Fantaisies, Joyeusetés et Mélancolies* (1887); *Gauloiseries Nouvelles* (1888); *Au pays du rire* (1888); *Fablaux Gailliards* (1888); *Contes à la Brune* (1890); *Contes Audacieux* (1890); *Histoire Joviales* (1890); *Contes Sales* (1891); *Le Célèbre Cadet Bitard* (1891); *Histoires Extravagantes* (1892); and *Pour les Amants* (1892). Dramas and operas for which Silvestre furnished the text are *Dimitri* (with Bernier) (1876); *Myrrha* (1880); *Monsieur* (with Burani) (1880); *Sapho* (1881); *Calente Aventure* (with Davye) (1882); *Aline* (with Hennequin) (1883); *Henry VIII* (with Detroyat) (1883); *Pedro de Zamalea* (1884); *La Tesi* (with Maillard) (1887); *Jocelyn* (1888); *Le Commandant Laripètre* (1891); *Griseldis* (with Morand) (1891); *Les Drames Sacrés* (with Morand) (1893). Among Silvestre's collections of art criticisms may be named *Le Nu au Salon de 1888 à 1892*; *Le Nu au Champ de Mars, Exposition de 1889* (1889); and *Le Nu au Louvre* (1890).

Simcox, Edith Jemima, an English literary critic, born in 1844; died in 1901. She was a younger sister of George Augustus Simcox, the poet, and of the late Rev. William Henry Simcox, and early in her career came under the influence of George Eliot, for whose genius Miss Simcox had a passionate admiration. She was one of the first contributors to *The Academy*, and she wrote for the *Fortnightly* and other periodicals, at first under the signature H. Lawrenny, but later over her own name. She was a pronounced agnostic. Her writing is able, but suffers much from obscurity, and the point of view is sometimes difficult to grasp, and to this circumstance may be attributed in some degree the comparative neglect into which it has fallen of recent years. Her published books are *Natural Law: An Essay in Ethics* (1877); *Episodes in the Lives of Men, Women, and Lovers*, a collection of Stories (1882); and *Primitive Civilizations, or Outlines of the History of Ownership in Archaic Communities* (1894).

Slaveikoff, M., a Bulgarian statesman, born about 1830; died in October, 1901. He was the poet and literary champion of Bulgarian independence and was elected president of the second National Assembly in 1880. In politics he was an adherent of Karaveloff, the leader of the Liberal party, and was Minister of the Interior in his second ministry, formed after the annexation of Eastern Roumelia. After that he held no ministerial post until Karaveloff called him into the Cabinet which he formed in March, 1901.

Smith, Edmund William, an English archaeological surveyor of the East Indian Northwest Provinces and Oudh, born in 1857; died in Mohinpurwa, Bahraich, India, Nov. 21, 1901. During Mr. Smith's residence in India he had made a detailed examination of the Mogul architecture of Fathpur Sikri, the ruined capital of Akhbar, and conducted extensive and judicious restorations at Lucknow, Fathpur Sikri, at the Taj Mahal in Agra, and at other places. The results of his investigations appear in his pub-

lished works, which include *The Shargui Architecture of Jaunpur* (1889); *The Mogul Architecture of Fathpur Sikri* (1894-'98); and *Portfolio of Indian Architecture: Drawings, Part 4* (1899).

Smith, George Murray, a British publisher, born in London, March 19, 1824; died in Weybridge, April 6, 1901. His father was chief partner in the firm of Smith, Elder & Co., India merchants and also publishers, and after the son had gone through the Merchant Taylors' school he entered the counting-house, became manager of the publishing department, and after the death of the elder Smith, in 1846, the head and manager of the whole business, which included banking and the general agency of the Overland route to India. He published the works of Charlotte Brontë, of Ruskin, and of Darwin, became Thackeray's publisher, founded the *Cornhill Magazine* in 1859 in order to issue the novels of that author in serial instalments, engaging Thackeray himself as its editor, and secured for the magazine George Eliot's *Romola*, for which he paid £7,000, instead of £10,000, the sum agreed upon if the author had extended the story to 16 parts according to the original agreement, whereas she finished it in 12 instalments. Thackeray retired from the editorship in 1862, and at a later period Leslie Stephen was editor for a time and James Payn after him. In 1865 Smith founded the *Pall Mall Gazette*, edited by Frederick Greenwood, and having the most brilliant English litterateurs for its contributors. Smith, Elder & Co., whose banking business was transferred to Henry S. King & Co., became Robert Browning's publishers, issuing a collected edition in 1868, followed by the first edition of *The Ring and the Book*. Matthew Arnold's prose writings were also printed by this firm, and Queen Victoria's *Leaves from the Journal of Our Life in the Highlands and Early Years of the Prince Consort*, as well as Sir Theodore Martin's *Life of the Prince Consort*, were given to them to publish. In 1882 George Smith, in consultation with Leslie Stephen, projected a *Dictionary of National Biography*, of which the first volume was issued in 1885 and the last in 1900.

Smith, James Hamblin, an English mathematician, born in Rickingham, Suffolk, Dec. 2, 1827; died in Cambridge in July, 1901. He was educated at Cambridge, and was a private tutor there in 1850-'92. He attained a high degree of proficiency as a mathematician, and his textbooks are among the most popular works of their kind. Among them are *Elementary Algebra* (1869); *Elementary Trigonometry* (2d ed., 1870); *A Key to Algebra* (1872); *An Introduction to the Study of Conic Sections* (1887); and *An Elementary Treatise on the Metric System of Weights and Measures* (1897).

Spicer-Jay, Edith Katherine, an English novelist, died in December, 1901. She took a deep interest in the welfare of the soldiers, and, for some years, until prevented by failing health, was honorary lady superintendent of the London Soldiers' Home and Guards' Home. Her fictions, which are mainly tales connected with army life, were written over the signature of E. Livingston Prescott. They were extremely popular in army quarters, and their author was buried with military honors. Her published books include *The Apotheosis of Mr. Tyransley* (1895); *Mask and Martyr* (1896); *Scarlet and Steel* (1897); *Rip's Redemption, a Trooper's Story* (1897); *Red-Coat Romances* (1898); *Dearer than Honor* (1898); *The Measure of a Man* (1898); *A Small, Small Child* (1898); *Helot and Hero* (1899); and *War and Illusion* (1899).

Stainer, Sir John, an English organist and composer, born in London, June 6, 1840; died in Verona, Italy, April 1, 1901. He was the son of a schoolmaster, and at the age of seven entered the choir of St. Paul's Cathedral, remaining chorister there until appointed to the post of organist at St. Michael's College, Tenbury, in 1856. Four years later he became organist of the university church at Oxford, retaining this place with the organistship of Magdalen College, till he succeeded Sir John Coss as organist of St. Paul's Cathedral in 1872. An accident to his eyes obliged him to resign this post in 1888. He was knighted in the same year, and in 1889 he was appointed Professor of Music at Oxford. He did much to vitalize the interest in music at the university, and his Sheldonian lectures on the subject were always fully attended. He was an excellent all-round musician, and enjoyed a wide and well-deserved popularity, but no one work of his stands prominently forth from among the mass of his admirable scholarly compositions. His works, which are very numerous, and include oratorios, cantatas, services, and hymns, are simple in construction, and melodiousness may be called their prevailing characteristic. The most popular of all his compositions is a sevenfold Amen, and among others may be named the oratorios *Gideon*, and *The Crucifixion*, and the cantatas *The Daughter of Jairus*, composed for the Worcester Festival of 1878, and *Mary Magdalen*, written for the Gloucester Festival of 1883. Sir John Stainer was likewise author of the following works upon music: *A Theory of Harmony* founded on the Temporal Scale (1871); *Harmony* (1877); *The Organ* (1877); *The Music of the Bible* (1879); and *Composition* (1880).

Stephens, James, an Irish agitator, born in Kilkenny in 1824; died in Dublin, March 29, 1901. He was a clerk to an engineer when in 1848 he took an active part in the Young Ireland rising under Smith O'Brien in 1848, on the collapse of which he fled to Paris with John O'Mahony. These two planned an oath-bound revolutionary organization which should unite the Irish race in all parts of the world for the overthrow of English rule and the establishment of an Irish republic. Stephens was to go to Ireland to organize the society there and enlist and secretly train the men who were to do the fighting, and as he took the post of danger he insisted that he should have supreme control of the movement at home and abroad. The time for the rising was naturally left for him to choose. O'Mahony's field was America, and his task was to raise the money to support the organization and obtain munitions of war and to select trained military officers who were to lead the insurgent forces into battle. The name that Stephens gave to the society was the Irish Republican Brotherhood. O'Mahony chose to call his branch by the political name of *Fianna Eirionn* after the legendary champions of Ireland; hence the name of Fenians came to be attached to all the members. They were bound by oath to bear true allegiance to the Irish republic, to obey implicitly the orders of their superiors, and to take up arms for the deliverance of Ireland when called upon. O'Mahony went to the United States in 1853, and with other exiles organized lodges in numerous places. Stephens when he first went to Ireland in 1856 had poorer success because the political movement had to be created and it was opposed from the start by the Catholic clergy. The Fenians of America gave it an impetus when they brought over in 1861 the remains of the dead patriot Terence Bellews McManus for a political funeral in Dublin. Stephens

started in 1863 a newspaper organ called the *Irish People*, and in an anonymous pamphlet he sketched in detail a constitution for the Irish republic, with a president, senate, and chamber of representatives, the latter to have one member to 30,000 inhabitants elected every three years by universal male suffrage and paid £300 a year; the senate to consist of 150 members partly elected by the chamber and partly nominated by the president, first for a preliminary term of five years, and after that for life, and to have sole power to impose taxation; the president to be elected by the senate from 3 names presented by the chamber and to draw a salary of £2,000; the seat of administration to be in Limerick, while congress was to meet at Athlone. Stephens, the head center, was exceedingly active, and not less secret, in his movements, going about everywhere to form branches, known to the incautious members who were caught and to the numerous spies and informers who worked among them as *Shewk*, which is the Irish word for hawk, a man of mystery whose real name and abiding-place were unknown, who could not be followed or detected. Other Fenians were not adepts at conspiracy. Most of the plans and secrets came out in print in the newspapers of Cork and Dublin or of Chicago and New York. The day of the rising was to be Sept. 20, 1865. Before that date men who had fought in the civil war of the United States on both sides in various ranks went over to Ireland and in barns and empty stores began drilling recruits in the use of rifles and pistols, of which there was no great provision, although \$400,000 had been remitted from the United States for the purchase of munitions of war. Five days before the appointed day the police seized the office of the *Irish People* and arrested the principal leaders of the movement, all except C. O. I. R., the Chief Organizer of the Irish Republic, as Stephens was styled, for whose apprehension a reward of £23,000 was offered. On Nov. 11 he was found in the person of "Mr. Herbert," a gentleman of fortune, residing with his wife in a villa at Sandymount. His trial was appointed to begin on Nov. 28. On Nov. 25, with the aid of two Fenians who were officials of the prison, he made his escape, and he was not again captured, although he hid himself in Dublin for four months, and in March, 1866, made his way to Paris. When the Fenians of the United States split into two warring factions over the question whether, as Roberts, the New York dry-goods merchant, desired, they should invade Canada, or whether, as O'Mahony insisted, they should make Ireland the sole objective, Stephens went over to try to make peace, but without success. He made a tour through the United States and promised that Ireland would rise on June 1, 1867, and that he would be there to head the rebellion. When that date came and he was found still in New York he was denounced as a traitor or a coward, and his life was threatened, on which he fled to Paris, and his disappointed followers derisively interpreted the initials C. O. I. R., which he had been accustomed to write after his name, to mean Cowardly Old Irish Renegade. The feeling against him subsided, but he played no part in Irish agitations afterward, and when he quietly returned to Dublin in 1891 he was presented with a cottage. His only subsequent action in Irish politics was a declaration in favor of Parnell when a section of the party discarded him as leader.

Stoiloff, Constantin, a Bulgarian statesman, born in Philippopolis in 1852; died April 5, 1901. He took his degree as doctor of laws in the uni-

versity of Heidelberg, took part in the Assembly of Notables which met at Tirnova in 1879 to frame the constitution of the new state, and has been from that epoch one of the chiefs of the Conservative party of Bulgaria. He was one of the delegates who offered the Crown to Prince Alexander at Livadia. He has been by turns Prime Minister, Minister of Foreign Affairs and of Worship, Minister of Justice, and Minister of the Interior. He was a man of European culture, a fine orator, and a statesman of clear views, but as executive head of the Government after the fall of Stamboloff he had not the energy to restrain the wild passions of his countrymen, whose nature he did not comprehend and to whom he appeared as an alien spirit. The murderers of Stamboloff carried out their plans with the active and passive connivance of officials, and the Macedonian committee became so powerful and so lawless as to endanger the public security. The worst episodes in the history of Bulgaria occurred in the administration of a minister who had the least sympathy with such excesses and no interest in suffering them to take place. The reconciliation with Russia occurred also in Stoiloff's administration.

Strachey, Sir Edward, an English author, born Aug. 12, 1812; died Sept. 24, 1900. He was third baronet in the succession, attaining this rank in 1858, and was educated at Haileybury and Eton colleges. He was high sheriff of Somersetshire in 1864, and resided at Sutton Court, Pensford, near Bristol. He edited Malory's *Morte d'Arthur* (1871); and was the author of *Theology, History, and Politics*; *Jewish History and Politics*; *Miracles and Science*; *Essay on Hamlet*; *Talk at a Country House*; and a collection of essays (1894).

Stubbs, William, an English historian, born in Knaresborough, Yorkshire, June 21, 1825; died in Cuddesdon, Oxfordshire, April 22, 1901. He was the son of a solicitor and received his education at Oxford. He took orders in 1848, and held a fellowship in Trinity College in 1848-50. From 1850 to 1866 he was vicar of Navestock in Essex, and for the last six years of this period held the office of diocesan inspector of schools for the diocese of Rochester. He was librarian to the Archbishop of Canterbury at Lambeth in 1862-68, and Regius Professor of Modern History at Oxford in 1866-84. In 1879 he was appointed residentiary canon of St. Paul's Cathedral, resigning the living of Cholderton, Wiltshire, where he had been rector from 1875. In 1884 he was consecrated Bishop of Chester, whence he was translated to the diocese of Oxford in 1889. His latest public appearance was at St. George's Chapel, Windsor, the day after the funeral of Queen Victoria, on which occasion he delivered the sermon. Long before his death he had come to be considered as the world's greatest medieval historian. His *Constitutional History* is indispensable to any one desirous of obtaining a sound knowledge of English history down to the time of the Tudors, but it must be admitted that it furnishes rather dry reading when compared with the work of his fellow historians Freeman and Green. The spirit in which all three men wrote, however, was the same, and was in marked contrast to that which inspired the historical writing of their brilliant contemporary Froude. Bishop Stubbs's publications, original and edited, comprise *Hymnale Secundum Usum Sarum* (1850); *Registrum Sacrum Anglicanum* (1858-97); *Tractatus de Sancta Cruce de Waltham* (1860); *Mosheim's Institutes of Church History* (edited) (1863); *Chronicles of the Reigns of Henry II and Richard I* (edited)

(1867); *Select Charters* (edited); *The Historical Collections of Walter of Coventry* (edited) (1872-73); *The Constitutional History of England in its Origin and Development* (1874-75); *Memorials of St. Dunstan* (edited) (1874); *The Historical Works of Master Ralph de Diceto* (edited) (1876); *The Early Plantagenets* (1876); *The Historical Works of Gervase of Canterbury* (edited) (1879-80); *Chronicles of the Reigns of Edward I and Edward II* (edited) (1882-83); and *Seventeen Lectures on the Study of Medieval and Modern History* (1886).

Stumm, Baron Karl Ferdinand von, a German industrialist, born in Saarbrücken, March 30, 1836; died at Castle Halberg, near that town, March 9, 1901. He studied in Bonn and Berlin, and in 1858 succeeded as head of the family firm which for over half a century had owned the iron-works at Neunkirchen. Under his management they became one of the greatest metallurgical establishments in the world, and he became also president of the Dillinger Furnace Company. In the French war he served as a captain of cavalry. He was always active in politics and was one of the founders of the German Imperial party. He sat in the Prussian Chamber from 1867 till 1870, and then in the Reichstag till 1881, and again from 1889 till the end of his life. He not only made his workshops models of technical progress and business methods, but he exercised a patriarchal sway over his 10,000 workmen in all the details of their lives, even in regard to their marrying, and if any of them read socialistic literature he was dismissed. Their mutual benefit associations were conducted under his personal supervision. He furnished them with model dwellings, gardens, baths, dining-halls, hospitals, technical schools, and a library. If any of them felt aggrieved about anything he wanted them to come directly to him. By such paternal care and discipline he was always able to keep socialists away and had no difficulty in always getting the votes of his work people. He regarded socialism as a baneful doctrine that threatened to destroy the state and disrupt society, and the socialists of the chair were even more obnoxious to him than the Social Democrats. Any interference of the Government in the labor question, any regulation diminishing the authority of the employer, seemed to him to unsettle at the foundations of society and disturb the conditions of industrial development and social progress. The Social Democrats regarded the "King of the Saarland" as their arch-enemy, and bitter controversies took place between him and the Socialist leaders in the Reichstag. He was nevertheless one of the authors and chief promoters of the measure for accident and old age insurance and advocated the principle that the Government should provide for the widows and orphans of working men. He endeavored to secure the reenactment of the exceptional laws against the socialists and proposed the dismissal of all professors in German universities whose doctrines were tinged with socialism. An intimacy subsisted between him and Wilhelm II from the time when the young Kaiser renounced the socialistic leanings which he manifested for a time and turned about in the opposite direction. During the Stumm era, as it was called, when the Baron von Berlepsch was compelled to resign the post of Prussian Minister of Commerce and Industry and the Kaiser contemplated repressive measures against socialism, the supposed political influence which Baron von Stumm was supposed to exercise over the Emperor gave occasion for questions to the ministers which did not come from the Social Democrats

alone. While this phase of the Emperor's mind passed like the rest, Baron von Stumm's dread of socialism grew more intense and overpowering.

Sutton, Henry Septimius, an English journalist, born in 1825; died in Manchester, in May, 1901. He entered journalism in connection with his father's paper, the Nottingham Express, and was editor of the Manchester Alliance News for a long period. He published, a half century ago, *The Evangel of Love and Quinquenergia*, two volumes of verse, which on his becoming a Swedenborgian he suppressed. Selections from these books with other poems were issued in later life by him—*Poems* (1886); *Poems* (1887). He was the author also of *Five Essays for the Student of the Divine Philosophy of Swedenborg* (1896).

Szilagyi, Desider, a Hungarian statesman, born in 1840; died in Budapest, July 31, 1901. He was educated for the law, became eminent in his profession, was appointed to various posts under the Ministry of Justice, was sent to England in 1870 to study the civil and criminal laws of that country as a preparation for the codification of the Hungarian law, in which he subsequently took a prominent part, was elected shortly after his return to the House of Representatives, and by his eloquence and his knowledge of laws and political institutions he made his mark at once as a legislator and political leader. After the work of codification was completed he accepted the chair of criminal law and political science in the University of Budapest. He was the principal author and promoter of the recent laws on marriage, education, and other subjects which were bitterly resisted by the Clericals. In the Wekerle Cabinet his was the dominating spirit. He carried through measures for the purification of elections and many other reforms, some of which were at first opposed on grounds of expediency by his own party.

Tait, Peter Guthrie, a Scottish scientist, born in Dalkeith, in 1831; died in Edinburgh, July 4, 1901. He was educated at the university of his native city, and at Cambridge, becoming a fellow in 1852. He was appointed Professor of Mathematics in Belfast College in 1854, and in 1860 became Professor of Natural Philosophy in Edinburgh University, a chair which he occupied until his death. Prof. Tait's published works include *Dynamics of a Particle* (1856); *Quaternions* (1867); *Thermo-Dynamics* (1868); *Recent Advances in Physical Science* (1876); *Light* (1884); *Heat* (1884); *Properties of Matter* (1885); *Dynamics* (1895); *Scientific Papers* (1898); *Newton's Laws of Motion* (1899). With Balfour Stewart he published *The Unseen Universe* (1875); and a *Treatise on Natural Philosophy*, with Lord Kelvin.

Tanner, Charles Kearns Deane, an Irish politician, born in Cork in 1849; died in London, April 21, 1901. He was the son of a physician, and was educated in Paris and at Winchester School, was graduated in arts and in medicine at Queen's University, Cork, and continued his medical studies in Leipzig and Berlin Universities. He practised medicine at Cork with success. In 1885 he was elected to Parliament as a Parnellite, and he held his seat until his death, joining later the Anti-Parnellite wing of the Irish party. Dr. Tanner carried the obstructive tactics of the Nationalists further than any other member of the party. He had a fiery nature and a combative temperament. Without any gift of oratory he had an acute and alert mind, and developed a gift for hackling the ministers and probing them with annoying questions; but so often did he scandalize the house by violating the accepted rules of par-

liamentary decorum, especially by the violence of his language, that they treated him with scant courtesy, though personally he was generally liked and respected. He came almost as often under the censure of the Speaker as all the other Irishmen together, and when Irish obstructionists were removed from the house, when most others yielded to a show of force, he always made a real fight.

Taylor, Isaac, an English scholar, born near Ongar, Essex, May 2, 1829; died in Settrington, Yorkshire, Oct. 18, 1901. He was the oldest son of Isaac Taylor, author of *The History of Enthusiasm*, and was educated at King's College, London, and Cambridge. He took orders in 1858 and was vicar of St. Matthias, Bethnal Green, London, in 1865-'69; rector of Holy Trinity, Twickenham, 1869-'75; and rector of Settrington in 1875-'1901. For several years he was a canon of York. He was the third Isaac Taylor to win distinction in literature, his grandfather being the well-known "Taylor of Ongar." He was a man of varied interests, and as one of the founders of the Alpine Club and an enthusiastic entomologist was known to many persons to whom his philological and other writings were unfamiliar. His published works include *Charicles: Illustrations of the Life of the Ancient Greeks* (edited) (1854); *The Liturgy and the Dissenters* (1860); *Words and Places* (1864); *The Burden of the Poor* (1867); *The Family Pen: Memorials, Biographical and Literary, of the Taylor Family of Ongar* (1867); *Etruscan Researches* (1874); *Greeks and Goths: A Study in the Runes* (1879); *The Alphabet, an Account of the History and Development of Letters*, his greatest work (1883); *The Manx Runes* (1886); *Domesday Studies* (1888); *Leaves from an Egyptian Notebook* (1888); *The Origin of the Aryans* (1890); *Names and their Histories* (1896).

Tearle, George Osmond, English actor, born in Plymouth, England, in 1852; died in Newcastle-on-Tyne, Sept. 6, 1901. His first appearance was at the Adelphi Theater, Liverpool, March 29, 1869, in the rôle of Guildenstern in *Hamlet*. Three years later he became leading man at the Marischal Street Theater, Aberdeen, Scotland, where he played Shakespearian and standard drama for ten months, after which he joined the company of Charles Reade, the novelist, playing in the original production of Reade's dramatization of his own novel, *The Wandering Heir*. He remained with this company one season, and then undertook the leading rôles at the Theater Royal, Belfast, Ireland, from which he went to the Gaiety Theater, London, where he appeared as leading man on March 29, 1875, in the play of *Rose Michel*. After this engagement he made a tour of the provinces in Mrs. John Wood's company, took part in the production of *Rip Van Winkle* at the Princess Theater, London, played leading rôles for a time at Drury Lane, and then organized a company of his own, with which he appeared in England and Ireland for several seasons in a Shakespearian repertoire. In 1880 Lester Wallack, manager of Wallack's Theater, New York, engaged Mr. Tearle as leading man in his company. He made his first appearance in America at Wallack's Theater in September, 1880, remaining there until the retirement of Lester Wallack from professional life a few years later. When the late Henry E. Abbey assumed control of Wallack's Theater in 1887 (changing its name to Abbey's Theater), Mr. Tearle was engaged to play the leading rôles. He played there for some time, and then went on the road in the United States for several seasons, returning to England about

1889, where, during the ensuing twelve years, he appeared at the head of his own company, chiefly in Shakespearian drama. Mr. Tearle was twice married. After being divorced from his first wife, he married (in Denver, Col., 1883) Minnie Conway, an American actress, formerly the wife of Jules Levy, the cornetist, and daughter of F. B. Conway, the actor-manager of the Brooklyn Theater.

Tucker, William Hill, an English clergyman, born Aug. 30, 1802; died in Brighton, Nov. 19, 1901. He was educated at Cambridge and was admitted deacon and priest in 1847. He became rector of Dunton-Waylett, near Brentwood, Essex, in 1845, resigning the living in 1892. He spent eleven years at Eton, and was all his life an enthusiastic Etonian. Eton of Old, or Eighty Years Since (1892), has been very popular.

Verdi, Giuseppe, an Italian composer, born in Roncole, Oct. 10, 1813; died Jan. 27, 1901. His father, the keeper of the village inn and of a small store in connection with it, encouraged the

boy's early bent and precocious talent for music, had him instructed by a strolling musician, and bought an old spinet, and soon the half-grown youth was able to take the office of organist in the village church, in which as choir-boy he first learned to love music, and in his rapt attention to the organ strains provoked

the wrath of the priest by neglecting the genuflections. A merchant of the neighboring town of Busseto, to whom he was apprenticed, being a great lover of music, furnished means for him to go to Milan to study, after he had gained what knowledge he could from Giovanni Provesi, leader of the Philharmonic Society. When the director of the conservatory, as the result of the entrance examination, refused to receive him as a student on the ground that he possessed no musical gift, although the municipal council of Busseto had added a contribution to aid him in completing his musical education. His patron, whose name was Barezzi, would not accept this verdict, nor did young Verdi, now nineteen years of age, lose heart, but took private instruction from Vincenzo Lavigna, conductor of the orchestra of the Scala Theater. He learned enough of composition with such poor help to essay some marches and ecclesiastical pieces, then returned to Busseto as conductor of the Philharmonic Society of that place and organist in the church as successor to his old teacher, Provesi, who died just before his return. The clergy would not have him as organist, but the town authorities voted him a stipend. Barezzi had such faith in his future that he gave him his daughter Margherita in marriage, and three or four years later the young couple removed to Milan, where, in November, 1839, Verdi's first opera, *Oberto di San Bonifacio*, was brought out at La Scala. Its success was not brilliant, but still it was so satisfactory that lasting relations were established between the composer and the music publisher Ricordi as well as Merelli, the director of the theater. Un Giorno

di Regno, produced a year later, did not please the public, and upon this disheartening failure came a domestic calamity, the sudden death of his wife and children. Verdi declared he would compose no more music. Merelli, however, kept him to his contract to write the score to *Simon Boccanegra*, and this opera established his fame. It was produced on March 9, 1841, and it led to his second marriage, with Giuseppina Strepponi, the singer of the part of Abigail, who remained until old age his tender and sympathetic companion. *I Lombardi alla Prima Crociata*, produced at La Scala on Feb. 11, 1843, was received with stormy applause. It won the affection of the Italians of Lombardy, and from this time Verdi wrought into his music, and the patriots of Italy found in it, the clarion notes that inspired them in their struggle for national independence and unity. The initials of his name were taken as an omen when the movement became ripe, foretelling the reign of Vittorio Emanuele Re D'Italia. In the operas that followed—in *Ernani*, *I due Foscari*, *Johanna d'Arc*, *Alzira*, and *Attila*—he knew how to touch patriotic chords in a way that gave an effect and significance to his works that none but Italians could appreciate and feel. *Macbeth*, *I Masnadieri*, *Jerusalem*, *The Corsair*, *Legnano*, *Luisa Miller*, *Stiffelio*, and other works written before 1849 are forgotten even in Italy. Verdi was a prolific and hasty composer at this period, regardless of dramatic unity and fitness, and even of musical symmetry, able to turn out in a fortnight a completed opera that satisfied the popular taste of the time, being written to suit the voices of the singers and to enable them to exhibit their flowery vocalization. He was inventive and versatile, constantly trying new effects and different styles. The melodious operas that he wrote after 1850 extended his fame to all parts of the globe and made him the universal popular favorite among musical composers, although stricter canons and higher artistic aims had already made of the musical drama in Germany a medium of political expression almost on the plane of the true drama, differing essentially from the artificial trivialities of the Italian school in which tragedy was made grotesque and comedy extravagant to furnish a humorous setting to a series of graceful melodies, unless the melody itself was sophisticated to accommodate the bravura of the singers. In graceful song of the purest Italian refinement and elegance Verdi showed himself in his newer development the supreme master, and underneath the crudities, the broad and striking effects, the democratic simplicity that offended musicians of the straiter order the more it captivated—first of all Italians, then the profane public of all countries—there was a romantic charm, a stirring vigor, a dramatic force in his music that places him among the great masters. The books were made according to his desire to agree with the musical themes that his genius evolved when he struck his true original vein. That first great period was ushered in by *Rigoletto*, first presented in Venice in 1851. Though fond of popular success, and gratified when he achieved admiration and gain, he had the sincerity of genius that despises professional trickery and advertisement. He adopted, nevertheless, an ingenious device to pique the curiosity of the Venetians and insure the full effect of that catching air *La donna e mobile* by not giving it to the tenor until the very evening of the first night. *Il Trovatore* was his next opera, and the next after that was *La Traviata*, which by a curious mischance was hissed in Venice. He knew the

Italian public, and told the singers that they did not understand his music. With a better schooled company it aroused in 1853 the same furor in Rome as the two other masterpieces, and later in Venice too. These three works, in which Verdi's merits and shortcomings, his strength and his weakness, are equally apparent, typified the music that the world liked when Wagner could impress only his disciples with the music of the future. The Sicilian Vespers (1855); Simon Boccanegra (1857); and Aroldo (1857) had only a transient success. Un Ballo in Maschera, while not lacking in popular qualities and captivating morsels of song, revealed a new Verdi, who sought to untold the dramatic theme, to reflect the phases of emotion, to fit the vocal score to the moments of the drama. He could write no such operas in three weeks. His next production, La Forza del Destino, was finished in 1862, and then Don Carlos in 1867. These transition works had no great success. His later style was fully formed, his new method of work quite mastered, when the Khedive-Ismaïl Pasha desired of him a piece to add glory to the magnificent opera-house that he had built in Cairo. The master put his soul into this work, Aida, which was produced at Christmas in 1871, and went the round of the earth, astonishing and puzzling the adherents of the old and the new schools, the admirers of the Italian and the German opera, in an equal degree. Wagner had triumphed in Germany and was winning ground in France and Italy. In London and St. Petersburg the artists of the musical stage alternated the strong dramatic impersonations of Wagnerian characters with the old rôles and their florid technique. People wondered whether the sexagenarian Verdi had become a Wagnerite or whether he simply made sport of the music of the future, producing by a *tour de force* a perfect Wagnerian opera in order to demonstrate to the world the hollow pretense of the new art. Aida is a finished musical drama as conscientiously elaborated as the works of Wagner in method and purpose, yet the music is thoroughly Italian, the style that of Verdi. While adapting the music to the sense and action of the piece with studious pains, and working out the dramatic thought of the composition with careful regard for the unities, the master remained true to himself and to his honest principle of avoiding recondite effects and technical mysteries and making the music agreeable and intelligible to the untutored masses. The fire, the emotional force, the irresistible charm of his earlier rough, disjointed pieces with which he had won wealth and the admiration of the world, which still were the prime popular favorites, were refined away. In pursuing the higher art, Verdi, whose uncultured genius had conquered and still held captive the popular taste, to the chagrin of the trained musicians even of the Italian school, weakened himself and sacrificed force to refinement. Nevertheless he devoted a laborious old age to cultivating the unities of the studied musical drama for art's sake and the honor of his country, conscious that he could gain no new laurels by work less impressive and characteristic than the vigorous and natural creations by which his reputation was already secured for generations. After fifteen years of silent labor he gave to the world *Otello* in 1889, and in 1893 *Falstaff*. In these he broke away from all the old formulas, abstained from the glittering gems with which he could have garnished the works to make them attractive, introduced no airs at all, molding the music to the poetry, making it follow the thought, the words

and action of the piece, and in harmony, instrumentation, and composition proving himself the equal of the masters of the higher music without borrowing from them a single idea, remaining Italian in all respects, and Verdi, still original and independent throughout. Musicians appreciate these elaborate and polished works, into each of which Verdi put toil, thought, and creative power sufficient to produce *Rigoletto*, *Trovatore*, and *Traviata*. The public does not like Verdi's music so refined, restrained, and elusive. Verdi produced 28 operas during his life. As one of the intellectual heroes of the movement for the political liberation of Italy his compatriots elected him on Jan. 3, 1861, to the first Italian Parliament as representative of Borgo San Donnino, the district in which his home was situated. He took his seat on the Right, made no speeches, and retired when the legislative period came to an end. The King made him a Senator in 1874, but after taking the oath he never again set foot in the Palazzo Madama. Although his works brought him a great fortune, he lived very simply in the old-fashioned way of the Italian middle class, often going himself to the market for the household provisions. By a quiet and methodical way of living he preserved his physical and intellectual vigor to a ripe old age. A great part of his wealth he devoted to founding in Milan an asylum for needy musicians.

Victoria, Queen of Great Britain and Ireland and Empress of India, born in Kensington Palace, London, May 24, 1819; died in Osborne House, Isle of Wight, Jan. 22, 1901. For a sketch of her life and the events of her reign, see *Annual Cyclopædia* for 1900, page 737. For a portrait, see *Annual Cyclopædia* for 1897, page 365.

Victoria, Empress **Friedrich** of Germany, Princess Royal of England, born in Buckingham Palace, London, Nov. 21, 1840; died in Homburg, Aug. 5, 1901. She was the eldest child of Queen Victoria and Prince Albert of Coburg, and grew up to be a princess of unusual intelligence and accomplishments. Before she was fifteen years old she was betrothed to Prince Friedrich Wilhelm of Prussia, and when seventeen she was married. The English people did not like the idea of a royal alliance with a house of such absolutist tendencies as the Prussian and so intimate with the despotic Russian Emperor. As time went on, a strong antipathy was felt among the governing class in Prussia toward the English princess because the Crown Prince seemed to have become imbued, through her influence, with notions of British constitutionalism and parliamentary government that were held in Germany only by an objectionable class of doctrinaire theorists and in a Prussian Crown Prince and future German Emperor were undignified and mischievous. As soon as the princess was settled in her new home she took up again her painting and sculpture and the habit of study in which her father had trained her, and she applied her mind especially to abstruse political theories and questions of political economy. In January, 1859, she gave birth to the present German Emperor. The antagonism in the court circle to her political views made itself felt after her husband became Crown Prince in 1861; and when her father-in-law, the King, abandoned the Liberalism he had professed when Prince of Prussia and placed himself under the guidance of Bismarck, her position became painful. The King and his son became estranged over politics, and the Crown Prince blamed Bismarck for misguiding his father, while Bismarck blamed the Crown Princess for instilling foolish heresies in her hus-

band's mind. Bismarck regarded the Liberal Englishwoman as his chief antagonist and most dangerous enemy as long as her husband lived. He feared she would import into the empire that he had built British constitutional liberties which he detested, or that she would endanger its existence by influencing her husband when he became Emperor to sacrifice its vital interests through being made an instrument of some design of English policy. The Crown Prince and Princess, as well as the Liberal party of Germany, opposed the military armaments, the annexation of Schleswig-Holstein, and the invasion of Austria, but the man of blood and iron had his way and was successful, and the multitude who had execrated him now acclaimed him. The Crown Princess thought the conquest of Hanover an act of spoliation, and in the French war she raised her voice to prevent the bombardment of Paris, which Bismarck thought a most unjustifiable interference. When negotiations were taking place for the federation of the German states the Crown Prince carried on separate negotiations with a view to an empire proceeding from the people, to be governed by an elective Parliament with responsible ministers. When the Crown Prince became the Emperor Friedrich I, on March 9, 1888, he was sinking rapidly with a fatal disease, and in ninety-nine days he was succeeded by his son Wilhelm II. This young prince had been placed by his grandfather under the political tuition of Bismarck, who had impressed upon him the sacred rights and responsibilities of the Kings of Prussia, the evils of Liberal ideas, and the danger of English influence. The relations between the Emperor and his mother were consequently unpleasant in the extreme. When Wilhelm withdrew his favor from the old Chancellor and unceremoniously dismissed him, and when he asked the Empress Friedrich to use her influence in his behalf for the sake of the country, she replied that through his own action she had been deprived of the power of influencing the Kaiser. She found her position in Berlin unbearable, and retired to a country place at Kronberg, near Frankfurt, calling the house built for her Friedrichshof, in memory of her deceased husband. The bitterness and chagrin of her life were softened when the Kaiser began to show some respect to his father's memory and some filial regard for her. She was seized with cancer, the same malady that carried off her husband, and had a lingering and painful end. She left six children: Emperor Wilhelm; Prince Heinrich of Prussia, who married Princess Irene of Hesse; Princess Charlotte, wife of Prince Bernhard of Saxe-Meiningen; Princess Victoria, married to Prince Adolf of Schaumburg-Lippe; Princess Sofia, married to the Crown Prince of Greece; and Princess Marguerite, married to Prince Friedrich Karl of Hesse.

Warr, George Charles Winter, an English scholar, born in Toronto, Canada, May 23, 1845; died in London, Feb. 21, 1901. He was educated at Cambridge, and was elected to a fellowship, but declined on account of the religious tests then in force. In after years he took part in the movement for the abolition of such tests. In 1874 he was appointed classical lecturer in King's College, London, and professor there in 1881. He assisted in founding the women's department of King's College at Kensington, and was classical lecturer there also. He published in 1883 *The Tale of Troy: A Classical Masque*, and followed it in 1886 with *The Story of Orestes*, from Æschylus, the two plays being issued in one volume in 1888, entitled *Echoes of Hellas*. His other

works include a translation of Teuffel's *History of Roman Literature* (1890); *The Greek Epic* (1895); and *The Oresteia of Æschylus*, a verse translation (1901).

Watkin, Sir Edward William, an English railroad manager, born in London in 1819; died there, April 14, 1901. He was the son of a London merchant, and engaged in the railroad business when it was new and uncertain, becoming secretary of the Trent Valley Railroad in 1845, and after this was absorbed by the London and Northwestern, general manager of the Manchester, Sheffield and Lincolnshire, of which he became chairman. In 1867 he became chairman of the Southeastern to extricate it from financial difficulties. In 1872 he performed a like service for the Metropolitan. He was a director of the most important British companies, and at one time president of the Canadian Grand Trunk. When the Erie Railroad was plunged into bankruptcy by Fisk and Gould he was sent to the United States to protect the interests of English investors. On his return he introduced some American methods in the British companies that he managed. He was elected to Parliament from Great Yarmouth in 1857, but was unseated on petition. He represented Stockport from 1864 to 1868 and the borough of Hythe from 1874 to 1895, first as a Liberal and after the division of the party on the Irish question as a Liberal Unionist. He was knighted in 1868 and made a baronet in 1880. As a railroad manager he had little experience of practical details. His distinction was in the conception of large schemes of amalgamation and expansion. He carried the Sheffield line, now known as the Great Central, to London, but did not succeed in uniting with it the Welsh and other railroads. He was the chief promoter of the Channel tunnel, which was condemned for military, not for engineering or financial, reasons.

Watters, Thomas, an English scholar, died in Ealing, Middlesex, Jan. 10, 1901. From 1863 to 1895 he had been in the Chinese consular service, and his knowledge of Chinese Buddhism was extensive, while he possessed also considerable familiarity with Sanskrit. He published *Lao-tzu: A Study in Chinese Philosophy* (1870); *A Guide to the Tablets in a Temple of Confucius, Shanghai* (1879); *Essay on the Chinese Language* (1889); and *Stories of Life in China* (1896).

Watts, Alfred Alaric, an English author, born in 1824; died in London, Jan. 2, 1901. He was a son of the English minor poet Alaric Alexander Watts, and in 1859 he married the eldest daughter of William and Mary Howitt, the well-known authors. Besides several poems, Mr. Watts was the author of a pleasant, gossipy life of his father (1884). His more talented wife died in 1884. When the French poet Béranger died, in 1857, Mr. Watts wrote and published a poem on the funeral, which began with the lines:

Bury Béranger! Well for you
Could you bury the spirit of Béranger, too!
Bury the bard if you will, and rejoice;
But you bury the body and not the voice.

This poem may have been, and probably was, the inspiration for the famous John Brown song that appeared nearly three years later.

Wennerberg, Gunnar, a Swedish composer, born in Lidköping, Oct. 2, 1817; died in Stockholm, Aug. 24, 1901. He studied philosophy at the University of Upsala and became Professor of Esthetics in 1846. He was called as counselor to the Ministry of Education in 1865, became Councilor of State in 1870, and in 1875 Governor

of Kronobergslan and a member of the Swedish Parliament. His earliest published compositions were songs which he gave to the world in a collection published in 1847, entitled *Frihetsaenger*, followed by a humorous student duet in 1848 called *Gluntarne*, and by the trio, *De Tre*, in 1850, and *Serenade* in 1851. Subsequently he devoted himself to religious music, and composed an oratorio on the Birth of Christ and music for the Psalms of David. He wrote many poems which won for him a seat in the Swedish Academy in 1866, and were collected and issued in 1881-'85.

Westcott, Brooke Foss, an English prelate, born near Birmingham in January, 1825; died at Bishop Auckland, July 27, 1901. He was educated at Cambridge, and was ordained in the English Church in 1851. From 1852 to 1869 he was an assistant master at Harrow School, becoming a canon of Peterborough in the last-named year and a canon of Westminster in 1883. He was Regius Professor of Divinity at Cambridge, 1870-'90, and succeeded the famous biblical scholar Lightfoot in the bishopric of Durham in 1890. Bishop Westcott was surpassed in learning by none of his colleagues of the episcopate. He was one of the greatest biblical scholars of his time, his New Testament in the Original Greek, with Introduction and Appendix (1881), prepared with the assistance of the late F. J. A. Hort, being a monument of profound scholarship. The bishop was very popular in his diocese, and was president of the Christian Social Union from its foundation until his death. He took the liveliest interest in social problems, and was constantly appealed to for advice in disputes between employers and employed. The list of his published writings is long, and includes, in addition to the work already mentioned, *Elements of Gospel Harmony* (1851); *History of the New Testament Canon* (1855); *Characteristics of the Gospel Miracles* (1859); *Introduction to the Study of the Gospels* (1860); *The Bible in the Church* (1864); *The Gospel of the Resurrection* (1866); *History of the English Bible* (1869); *On the Religious Office of the Universities* (1873); *The Paragraph Psalter for Choirs* (1879); *The Revelation of the Risen Lord* (1882); *The Epistles of Saint John, with Notes and Essays* (1883); *The Historic Faith* (1883); *Some Thoughts from the Ordinal* (1884); *The Revelation of the Faith* (1884); *Christus Consummator* (1886); *Social Aspects of Christianity* (1887); *The Victory of the Cross* (1888); *Gifts for Ministry* (1889); *The Epistle to the Hebrews: Greek Text, with Notes and Essays* (1890); *Essays in the History of Religious Thought in the West* (1891); *Ideals* (1891); *The Incarnation and Common Life* (1893); *The Gospel of Life* (1893); *Some Lessons of the Revised Version of the New Testament* (1897); *Christian Aspects of Life* (1897); and *Lessons from Work* (1901). Not the least valuable labor of Bishop Westcott's life was that performed in connection with the revision of the Old and New Testaments.

Willoughby, Digby, an English adventurer, died June 4, 1901. He went to Madagascar during the French operations of 1884, won the confidence of the Prime Minister, and was appointed adjutant-general of the Malagasy army and entrusted with the whole management of military affairs. He raised and trained an army of 20,000 men which fought the French for two years. When the war was over he was sent as envoy to obtain the aid of the British Government in resisting the French annexation. He was cordially received in London, but not officially in the

capacity of a diplomatic representative, it being explained that as a British subject he could not represent a foreign government. After the Malagasy Government was finally suppressed he went to Rhodesia and commanded a force in the war with the Matabeles.

Yonge, Charlotte Mary, an English author, born in Otterbourne, near Winchester, Aug. 11, 1823; died there, March 24, 1901. She came of a good Hampshire family and was educated at home by her parents.

She wrote mainly for young people, especially young girls, and although an extremely prolific author, she led a very retired life, nearly all of it being spent in the tiny Hampshire hamlet where she was born. She was a firm believer in High Church ideas of doctrine and practise, and some of her early

books are a little narrow. As her literary sense developed, however, she became more just toward representatives of opinions differing from her own, and in her latest years had unconsciously come to occupy a much more liberal standpoint than formerly. Her readers included those of all communions and of none. A controversial tone is traceable in her first books, and some of them, like the famous *Heir of Redclyffe*, are rather morbid; but her skill in telling a story and remarkable gifts in the delineation of character outweighed her literary defects, and as her style matured these faults disappeared. The *Heir of Redclyffe* exercised a deep influence upon William Morris, Burne-Jones, and others of that group, while they were at Oxford, and, as Morris's biographer points out, it was the first book that affected him in any important way, he and his associates endeavoring for a time to pattern their lives after the life of the hero of the tale. The late Canon Dixon, after alluding to this circumstance, and his own long acquaintance with the book, pronounces the story "one of the finest books in the world." Miss Yonge devoted a large share of the proceeds from the sale of this book to the fitting out of a missionary schooner for the use of Bishop Selwyn of New Zealand, while the £2,000 received from the sale of *The Daisy Chain* were given by her toward the erection of a missionary college at Auckland. In 1898 Sir Walter Besant suggested that a university scholarship in the Winchester High School for Girls should be subscribed for by Miss Yonge's admirers and named in her honor. Nearly £2,000 were raised in this way, and in the year following the project was carried into effect. In 1893, on the occasion of her seventieth birthday, a bound volume containing 5,000 autographs of persons in all parts of the world who were admirers of her talents was presented to her. For thirty years she edited the *Monthly Packet*, a magazine primarily intended for young women, during the later years of her editorship sharing the duties with Miss Christabel Coleridge. The late Mrs. Oliphant wrote of Miss Yonge's novels that they "added quite a new world of excellent Church people, good, noble, and true, with all their fads

and little foolishnesses, all their habits of mind and speech, their delightful family affection, and human varieties of goodness, to an inferior universe, in which, with all its faults, there are so many such that a sympathetic and interested audience can never be wanting." In person Miss Yonge was tall, and in the latter portion of her life, at any rate, somewhat stout, with an abundance of white hair. Her manner upon a first introduction was constrained, and it was not always easy to draw her into conversation, but with better acquaintance the shyness wore away and she would talk with animation, having, as it would seem, a fund of anecdote and humor at command. Elderfield, her home at Otterbourne, is the last house at the southern end of the straggling village, and across the highway stand the parish school and church, the former owing much of its practical helpfulness to the novelist's supervision, and the latter rebuilt by her father in the later years of her girlhood. A few miles north is the vicarage of Hursley, the home of Miss Yonge's friend, the poet John Keble, for a generation the vicar of the two parishes. The following is a nearly complete list of Miss Yonge's published works, with the exception of translations from the French, which are not enumerated: *The Chateau de Melville*, a collection of French exercises and translations, the author's first book (1843); *Abbey Church* (1844); *Scenes and Characters* (1847); *Kings of England: A History for Young Children* (1848; abridged, with questions, 1851); *Langley School* (1850); *Hopes and Fears* (1850); *Kenneth* (1850); *Henrietta's Wish* (1850); *Two Guardians* (1852); *Landmarks of History: Ancient History* (1852); *Landmarks of History: Middle Ages* (1853); *The Heir of Redclyffe* (1853); *The Little Duke, or Richard the Fearless* (1854); *Castle Builders* (1854); *Heartsease* (1854); *History of Sir Thomas Thumb* (1855); *The Lances of Lynwood* (1855); *Leonard the Lion-hearted* (1856); *The Daisy Chain* (1856); *Ben Sylvester's Word* (1856); *Dynevor Terrace* (1857); *Instructive Picture-Book, or Lessons from the Vegetable World* (1857); *Landmarks of History: Modern History* (1857); *Christmas Mummings* (1858); *Marie Therese de Lamourous*, abridged from the French (1858); *Conversations on the Catechism* (1859); *Pigeon Pie: A Tale of the Roundhead Times* (1860); *Friarswood Post-Office* (1860); *Stokesley Secret* (1861); *The Young Stepmother* (1861); *Biographies of Good Women* (edited) (1862); *History of Christian Names* (1863); *Sea Spleenwort, and Other Stories* (1863); *Wars of Wapsburgh* (1863); *Countess Kate* (1863); *Historical Drama: Containing The Mice at Play, The Apple of Discord, The Stupid Falcon* (1864); *The Trial: More Links of the Daisy Chain* (1864); *A Book of Golden Deeds of All Times and All Lands* (1864); *The Prince and the Page* (1865); *The Clever Woman of the Family* (1865); *The Dove in the Eagle's Nest* (1866); *The Danvers Papers* (1867); *The Pupils of Saint John the Divine* (1867); *Six Cushions* (1867); *Cameos from English History, from Rollo to Edward II* (1868); *The Chaplet of Pearls* (1868); *New Ground* (1868); *A Book of Worthies gathered from the Old Histories and Written Anew* (1869); *Key-notes of the First Lessons for Every Day in the Year* (1869); *The Seal* (1869); *Musings on the Christian Year and Lyra Innocentium* (1870); *The Caged Lion* (1870); *Scripture Readings for Schools and Families* (1871); *A Parallel History of France and England* (1871); *Pioneers and Founders, or Recent Workers in the Mission Fields* (1871); *Little Lucy's Wonderful Globe* (1871); *P's and Q's, or the Question of Putting*

Upon (with C. Coleridge, 1872); *In Memoriam: Bishop Patteson* (1872); *Life of John Coleridge Patteson* (1873); *Lady Hester* (1873); *Chronicles of the House* (1873); *Aunt Charlotte's Stories of English History* (1873); *Aunt Charlotte's Stories of French History* (1874); *My Young Alcides* (1875); *Aunt Charlotte's Stories of English History* (1875); *Aunt Charlotte's Stories of French History* (1876); *The Three Brides* (1876); *Woman-kind* (1876); *Eighteen Centuries of Beginnings of Church History* (1876); *Aunt Charlotte's Stories of Roman History* (1877); *Aunt Charlotte's Stories of German History* (1877); *The Story of the Christians and Moors in Spain* (1878); *France: A History Primer* (1878); *Disturbing Elements in the Chronicles of the Blue Bell Society* (1878); *Magnum Bonum* (1879); *History of France* (1879); *Burnt Out* (1879); *Gold Dust: Counsels for the Sanctification* (1880); *Verses on the Gospels for Sundays and Holidays* (1880); *Love and Life* (1880); *Bye-Words* (1880); *Lads and Lasses of Langley* (1881); *Aunt Charlotte's Evenings at Home with the Poets* (1881); *How to Teach the New Testament* (1881); *Langley Little Ones* (1882); *Frank's Debt* (1882); *Cheap Jack* (1882); *Sowing and Sewing* (1882); *Pickle and his Page* (1882); *Talks about the Laws we Live Under* (1882); *Wolf* (1882); *Unknown to History: The Story of Mary of Scotland* (1882); *Stray Pearls* (1883); *Aunt Charlotte's Stories of American History, with H. H. Weld* (1883); *Langley Adventures* (1883); *Cameos from English History: England and Spain* (1883); *Landmarks of Recent History: 1770-1883* (1884); *The Armorer's Prentices* (1884); *Nuttie's Father* (1885); *The Two Sides of the Shield* (1885); *Chantry House* (1886); *The Little Rick Burners* (1886); *A Modern Telemachus* (1886); *Astray* (with M. Bramston, C. Coleridge, and E. Stuart) (1886); *Cameos from English History: The Stuart Rule* (1887); *Under the Storm* (1887); *The Victorian Half-Century* (1887); *What Books to Lend and What to Give* (1887); *Hannah More, a Biography* (1888); *Our New Mistress* (1888); *Nurse's Memories* (1888); *Preparation of Prayer-Book Lessons* (1888); *Life of H. R. H. the Prince Consort* (1889); *Beechcroft at Rockstone* (1889); *The Cunning Woman's Grandson* (1889); *A Reputed Changeling* (1889); *More Bye-words* (1890); *The Slaves of Sabinus* (1890); *The Constable's Tower* (1891); *That Stick* (1892); *An Old Woman's Outlook in a Hampshire Village* (1892); *The Cross-Roads* (1892); *Grisly Grisell, or the Laidly Lady of Whitburn* (1893); *Strolling Players* (with C. Coleridge) (1893); *The Cook and the Captive* (1894); *The Rubies of St. Lo* (1894); *The Carbonels* (1895); *The Long Vacation* (1895); *The Release, or Caroline's French Kindred* (1896); *The Wardship of Steepcombe* (1896); *The Pilgrimage of the Ben Beriah* (1897); *John Keble's Parishes* (1898); *The Patriots of Palestine* (1898); *The Herdboy and his Hermit* (1899); *The Making of a Missionary* (1900); *The Herb of the Field; and Railway Children*. A recent writer, in speaking of Miss Yonge's personality, says that "in spite of her excessive shyness, even a casual acquaintance would have been impressed with the directness and force of her character. Her eyes had a quick, responsive flash when anything moved her, and she was so full of eager human sympathy that a more intimate knowledge but deepened the impression that she herself was greater than anything she had done, and that she had missed, by just too much or too little, among the influences that shaped her life, the chance of writing her name with the immortals."

OHIO. (See under UNITED STATES.)

ONTARIO, a province of the Dominion of Canada; area, 222,000 square miles; population in 1901, 2,180,881. Capital Toronto.

Government.—With the opening of the year the Liberal Government entered upon the thirtieth year of its continuous existence, under different heads and with many individual changes. On Jan. 1, 1901, it was composed as follows: Prime Minister and Treasurer, George W. Ross; Attorney-General, John M. Gibson; Commissioner of Crown Lands, Elihu J. Davis; Commissioner of Public Works, F. R. Latchford; Provincial Secretary, J. R. Stratton; Minister of Education, Richard Harcourt; Minister of Agriculture, John Dryden; ministers without portfolio, James T. Garrow, William Harty.

The session of the Legislature was opened on Feb. 6 by Lieut.-Gov. Sir Oliver Mowat, G. C. M. G., with a speech from the throne, of which the following are the important passages:

"The valor displayed by the Canadian soldiers engaged in the South African War has reflected the highest honor upon Canada, and entitles them to some token of your appreciation. To this end, a bill will be submitted for your consideration authorizing the Crown Lands Department to set aside certain townships in the unorganized districts permitting every volunteer enrolled in the province who served in South Africa to choose 160 acres to be held upon the most favorable conditions compatible with the settlement of the public domain and the development of the district. Provision will also be made for the recognition of the survivors of the volunteer militia who were actually engaged in defensive service on the frontier during 1866.

"The agricultural classes during the past year have enjoyed unusual prosperity. Improved methods of farming and a more thoughtful application of the principles of sound husbandry, with the general adoption of cold storage by dairymen and fruit-growers, have greatly contributed to this happy condition of affairs. It has been found, by various tests conducted by the Department of Agriculture, that the soil and climate of Ontario are admirably adapted for the growth of sugar-beets. You will be asked to consider whether farmers should not be encouraged to give such special attention to beet-raising as will justify the establishment of factories for the production of beet-root sugar by granting such aid for this purpose as may be deemed expedient.

"The lumber-trade is in a prosperous condition, and the revenue from woods and forests continues buoyant, employment being abundant and wages high. The continued investment of capital in the erection of sawmills affords satisfactory evidence of the wisdom of requiring that logs cut on the Crown domain shall be sawn in our own country. The preservation of our forest wealth continues to engage the attention of my Government, and the recent setting apart of a large forest reserve in the pine region surrounding Lake Temagaming marks another step in this direction. The increasing flow of population to New Ontario is a matter of congratulation.

"I congratulate you on the great expansion of the mineral industry. The manufacture of pig iron in the province is now firmly established and is materially aided by the discovery of large bodies of conveniently situated hematite ore in the Michipicoten region. The making of the first open-hearth steel in the province and the establishment on the upper lakes of the first line of steamers to carry the ore from our own mines to the smelters of our own province are events significant of substantial progress. Nickel and copper

mining is more active than at any previous time, and it is gratifying to know that additional works for treatment of these ores are being erected in different parts of the province. Acting on the authority given to the Government by the appropriation made for exploring that part of the province lying toward Hudson Bay, exploration parties spent the greater part of the summer in investigating the agricultural, forest, and mineral resources of the several districts assigned to them.

"During the past year extensive alterations have been undertaken in connection with the buildings at Cobourg to meet the urgent demand for additional accommodation for the insane. These alterations are well advanced, and will, I trust, be completed before the close of the current year.

"Measures will be submitted for aiding in the improvement of public highways; for the encouragement of the trade in dressed meat for the European market; for abolishing tolls on public highways and bridges; for further encouraging technical education; and for consolidating the laws with respect to public and high schools and to liquor licenses."

The house was prorogued on April 15. The following were among the acts passed:

To provide for the appropriation of certain lands for the volunteers who served in South Africa and the volunteer militia who served on the frontier in 1866.

To amend the succession duties act.

Respecting the encouragement of the sugar-beet industry.

Respecting summary convictions.

To amend the registry act.

To amend the land titles act.

Amending the sawlog driving act.

To amend "an act respecting the licensing of extraprovincial corporations."

To facilitate the purchase of toll-roads by municipalities.

Respecting sanitary regulations in unorganized territories.

Further to improve the factories act.

To amend the Ontario shops regulation act.

To amend the Ontario fisheries act, 1900.

To consolidate the debenture debt of the city of Guelph.

To incorporate the city of Woodstock and for other purposes.

To incorporate the Chippewa and Niagara Falls Electric Railway Company.

To incorporate the Essex and Kent Radial Railway Company.

To incorporate the London, Aylmer and North Shore Electric Railway Company.

To incorporate the Magnetewan River Railway Company.

To incorporate the Niagara District, Wellandport and Dunnville Electric Railway Company.

To incorporate the Norwood and Apsley Railway Company.

To incorporate the Windsor, Essex and Lake Shore Rapid Railway Company.

Finances.—On Feb. 21 the Hon. G. W. Ross delivered his budget speech. The assets of the province on Dec. 31, 1901, were described as follow: Direct investments, \$251,243.60; funds held by the Dominion in behalf of the province, and upon which interest at the rate of 5 per cent. per annum is payable, \$4,758,135.15; common-school fund held by the Dominion on behalf of the provinces of Ontario and Quebec, and upon which interest is payable at the rate of 5 per cent., and divisible as between the province in ratio of last decen-

nial census (1891), \$1,492,475.84; bank balances, \$1,033,546.31—a total of \$7,535,400.90. The liabilities included the balance of an account current with the Dominion from confederation to date of \$1,815,848.89; common-school fund collections payable to the Dominion in trust, \$4,010.46; railway certificates estimated at present value, \$1,274,847.96; annuities estimated at present value, \$1,860,222.10—a total of \$4,954,929.41. These figures left a surplus of assets amounting to \$2,580,471.49. The receipts for the year were \$4,201,080.29, and the expenditures \$4,003,729.37. The balance in the banks on Jan. 1, 1900, was \$836,195.39, and on Dec. 1 of the same year it amounted to \$1,033,546.31. Mr. Ross pointed out that the receipts for 1900 were \$9,452.90 in excess of the estimates, and showed an actual surplus over expenditure of nearly \$200,000. The actual expenditure was \$99,991.67 less than the estimate.

Lieut.-Col. Arthur James Matheson, who for some years had been Opposition critic in financial matters, replied to the Treasurer. He declared that no correct view of the finances of the province had been given; that, instead of a surplus, there was actually a deficit this year as well as an expected one next year; that the sum of \$636,000—being a bonus on timber sales made in 1899 and a special matter—should not properly be included as regular receipts; that \$24,000 which had been received on capital account for drainage debentures should not be accounted as ordinary revenue; that certain special expenses, such as the cost of the London Normal School, the Cobourg Asylum, the National Patriotic fund, and the Ottawa Fire fund, should be deducted from the ordinary expenditures, leaving a practical deficit between regular revenue and expenditure of \$288,000.

The University.—The condition of Toronto University has been growing financially worse, and as it is controlled largely by the provincial Government, both political parties appear to have felt this year that something should be done to relieve the situation. On Feb. 27 Mr. Richard Harcourt, Minister of Education, spoke on the subject, and intimated that a definite scheme of aid to the university would shortly be submitted. He pointed out that during the past four years the deficits of the institution had aggregated \$31,600, and that the university had not been “doing all the work which its graduates and friends and the thinking public would expect it to do.” The important departments of mineralogy and geology were lacking in equipment, a building was wanted in connection with the teaching of physics, a physical laboratory was required, and general extension along the lines of industrial and commercial education was desirable. The minister went on to describe the measure of suitable Government aid as being “exactly the measure of the needs of the institution.” On the departments of mineralogy and geology the university now only spent \$2,000 a year, where similar institutions across the line expended \$50,000.

Mr. Whitney, the Opposition leader, while favoring assistance to the university in a general way, differed from Mr. Harcourt in believing that educational reform should begin at the bottom instead of at the top. “The only way to build a house is to start with the foundation. There is no use endeavoring to impart the higher education to a people not already well grounded. The vast number of the youth in this province will never go to the university, and therefore the first step to be taken is to improve the public schools.” Meanwhile the graduates of the university had been organizing an association in different parts

of the province, and on March 13 a large deputation waited upon the Government at Toronto. Dr. R. A. Reeve, president of the City Alumni Association, delivered an address in which he declared that the university belonged to the state as much as the custom-houses or the experimental farms. The Premier in his reply recognized the necessity of encouraging the scientific side of the university, deprecated the idea of the Government being expected to make the institution equal to the great universities of Germany or Great Britain, pointed out that the financial resources of Ontario were not unlimited, and concluded by promising aid in some form to be shortly indicated.

On March 21 Mr. Harcourt introduced into the Assembly “an act to amend the act respecting the University of Toronto and University College of Toronto.” By this measure, to the scientific department of the university was given a sum estimated at \$20,000 for the current year, in addition to the sum it already drew out of the previous Government grant for general university requirements. Land was also set apart for buildings for the mineralogy and geology departments and for an extension of the present School of Practical Science. A board of trustees was to be appointed to control financial and property matters, and to keep them apart from academic or educational affairs. A principal of University College was to be appointed distinct in function and position from the president of the university. Special provision was made for the possible entry of Trinity University into the federation of colleges known as the University of Toronto, and a site was reserved for new buildings, should it decide to do so. Various minor matters of reform and rearrangement were also defined and dealt with, the most important being the withdrawal of Government nominees from the university senate, only the Minister of Education remaining an *ex-officio* member. In addition to the specified financial conditions of the measure, it was announced on the succeeding day that a new building for the science department would be begun at once at an estimated cost of \$200,000. The proposals finally became law, though the university authorities did not consider them sufficiently liberal.

Land Grants to Soldiers.—On Feb. 20 the Hon. E. J. Davis moved the first reading in the Legislature of a bill granting certain lands to Ontario soldiers who had served in South Africa and to the survivors of those who had served against the Fenians in 1866. The minister explained the measure, and stated that 160 acres of land in either the free-grant section of New Ontario or the districts where a charge was now made to those taking up land, would be set apart for persons enrolled in the province for active service who had actually served in South Africa; for the next of kin of any who had met death in the war; and for members of the volunteer militia who could prove actual defensive service in 1866. All land so granted was to be free of settlement duties, provincial and municipal taxes (except school-rates) for ten years. If, however, the land was disposed of by the original owner within that period, then it was to become subject to the usual taxation. In order to prevent the possible locking up of large areas of land, no more than one location of 160 acres was to be allowed to the square mile. Nurses, chaplains, Red Cross commissioners, and newspaper correspondents were also to be entitled to these grants on the same conditions. The Government estimated the number eligible for this purpose at about 1,000. The measure was passed. The only extension of its provisions was

that by which the Fenian raid veterans of 1865 and 1870 were recognized, as well as those of 1866.

Good Roads.—The good-roads legislation of the session was a prominent feature. On Feb. 15 the Hon. Frank R. Latchford, Commissioner of Public Works, was attending a convention called at Ottawa to discuss the general question under the auspices of the county council of Carleton. He said the Ontario Government had \$1,000,000 of actual cash in the bank, and was prepared to grant financial aid to this amount toward the construction of good roads as soon as the municipalities had decided whether the county councils or the township councils should expend the money. On March 1 the Premier introduced a measure entitled "An Act for the improvement of the public highways," which provided that the sum of \$1,000,000 be set apart, to be paid out of the consolidated revenue of the province, for the improvement of its public roads. There were clauses including an arrangement for abolishing toll-gates and buying improved road-making machinery. The measure passed without opposition on April 11. There was, of course, some criticism in a general way from the Opposition. It was pointed out that the townships of Ontario had expended the following sums upon road building and repairing during a period of ten years: 1889, \$685,371; 1890, \$779,028; 1891, \$755,323; 1892, \$743,651; 1893, \$806,781; 1894, \$796,755; 1895, \$639,241; 1896, \$702,212; 1897, \$706,091; 1898, \$772,947.

Railways.—The most important legislation of the session was that connected with railway matters. On Jan. 16 the county council of Peterborough passed a memorial to the Lieutenant-Governor in Council, asking that aid be given to the Norwood and Apsley Railway Company, which proposed to open up a fertile and hitherto inaccessible region in the northeastern part of the country. Such a policy, it was said, would benefit 250,000 acres of Crown lands, develop a large mineral district rich in corundum and mica, and encourage tourist traffic through a country eminently suited for such purposes. The company was duly incorporated by an act that passed on March 29, and the final announcement of subsidies gave it \$3,000 a mile for 25 miles. Similar subsidies granted toward the end of the session included the Bracebridge and Trading Lake Railway of \$3,000 a mile for 16 miles; the Bruce Mines and Algoma Railway, \$3,000 a mile for 13 miles; the Port Arthur and St. Joseph Railway, \$2,000 a mile for 30 miles; the Grand Trunk Railway, \$10,000 for the construction of a spur line from Burk's Falls to the Magnetawan river; and a railway in Oso and Lanark townships, \$3,000 a mile for 25 miles.

The Premier, on April 2, introduced a measure in the Legislature granting to the Manitoulin and North Shore Railway Company 2,542,000 acres for the construction of 285 miles of railway with terminus at Meaford and Sudbury, and branches connecting Meaford with Owen Sound and Wiarton with Tobermory. Ice-boats were to be run in winter between Manitoulin island and Tobermory, and a general ferry service costing \$30,000 to be established; the Grand Trunk and Canadian Pacific Railways were to have equal running rights over the road; and Mr. F. H. Clergue, the capitalist of Sault Ste. Marie, owner of the charter, promised to place 1,000 settlers on the lands annually for ten years, and to construct a smelter on the line of the railway with a 300-ton capacity a day. Mr. Clergue, or the company, agreed to give the province full control over its passenger

and freight rates, and to grant running powers on fair terms over its lines to any other road. The line was to be completed by June, 1906. Mr. Whitney, in behalf of the Opposition, concurred in the second reading, and the measure passed unanimously to final reading on April 11.

New Ontario Development.—This subject was much discussed, partly on account of political considerations, partly because of actual material progress. The result of explorations under Government auspices, the mineral development of Michipicoten, the progress of the Clergue industries at Sault Ste. Marie, the encouragement afforded by the pulp-wood demands, and the conditions of projected railway schemes, all tended to keep this northern part of the province well in the public mind. On March 6, 1901, a large deputation waited upon the Hon. Mr. Sifton at Ottawa, and asked the Minister of the Interior for a grant of \$100,000 annually to encourage immigration to this part of the country. Sir L. H. Davies, Minister of Fisheries, was then waited upon and asked to establish a fish-hatchery for Lake Superior. He referred the matter to the Superintendent of Hatcheries. The Minister of Agriculture was asked for quarantine stations at Port Arthur and Fort William, while the Ministers of Public Works and Railways were requested to deepen the St. Lawrence to 21 feet, so that vessels from Halifax and St. John might ascend to Fort William without difficulty. The construction of breakwaters and the carrying out of dredging operations at Port Arthur and Fort William were also urged. They also wanted ice-breaking boats on Lake Superior, and a subsidy to an interprovincial line of steamers.

On March 11 the same deputation waited on the Ontario Government and asked for aid to bridges and colonization roads, aid for certain railways, increased representation, prolongation of the shooting season, and more system in looking after immigrants for New Ontario.

Education.—The Hon. Richard Harcourt, Minister of Education, published his annual report in February. The following summary of conditions are shown by it: School population (1899), 586,350; public-school registration, 429,227; number of public schools, 5,654; average attendance in public schools, 243,325; Roman Catholic separate schools, 352; average attendance in separate schools, 25,767; Protestant separate schools, 218; average attendance in Protestant separate schools, 216; number of kindergartens, 119; average kindergarten attendance, 4,701; number of night-schools, 16; average attendance at night-schools, 262; number of high schools and collegiate institutes, 130; pupils in high schools, 22,460; amount expended for public schoolhouses, \$322,403; total amount expended on public schools, \$4,020,048; total expended on high schools, \$722,239.

There was an increase during the year of 67 in the number of public schools, a decrease of \$23,185 in the amount expended upon them, and a decrease of 4,455 in the average attendance. The Roman Catholic separate schools showed an increase of 7 in number and 129 in average attendance; high schools showed a decrease of 3 in the number of teachers and 841 in attendance.

Crown Lands and Forests.—The Hon. E. J. Davis, Commissioner of Crown Lands, made his report public early in the year. The area sold in 1900 was 65,996 acres, having a total value of \$91,837, and on account of these and previous sales there was collected \$68,861. Crown lands for mining were leased to the extent of 27,835 acres, and the rental received for these and pre-

viously rented lands was \$69,714. Small quantities of clergy, common-school, grammar-school, railway, and university lands were also sold, and the total revenues of the department for the year were \$1,447,949. The total disbursements were \$272,257, including \$19,200 for mining schools, \$34,507 for explorations in northern Ontario, \$6,257 for immigration, and \$3,243 for colonization. The revenue from woods and forests was \$1,276,376, of which \$576,320 was timber dues.

There had been a continuous and increasing demand for pulp-wood, and the Sault Ste. Marie Pulp and Paper Company had operated their mechanical pulp-mill steadily through the year, besides adding a sulfite-mill of large capacity. The Spanish River Pulp and Paper Company was going on successfully. Regulations had been made to prohibit the export of spruce pulp-wood cut on Crown lands, as well as of hemlock-bark used for tanning. A forest reserve had been created near Lake Temagaming in Nipissing of 2,200 square miles. A similar region of 45,000 acres on Thunder Cape in Thunder Bay district had also been made a forest reserve.

Agriculture.—The annual report of the Ontario Bureau of Industries appeared in the summer. The total value of farm-land in Ontario had shown a steady decrease from 1891 to 1899, but it had risen from \$563,271,777 in the latter year to \$574,727,610 in 1900. Including, however, the value of buildings, implements, and live stock, the decrease had ceased in 1897, and the increase proceeded from \$905,093,613 in that year to \$974,814,931 in 1900. The value of farm-buildings in 1900 was \$219,488,370; of implements, \$57,324,130; of live stock, \$123,274,821. The statistics of wool showed in this year 957,307 fleeces of 5,805,921 pounds weight, and \$894,112 in value. There had been comparatively slight variations in the product and values during the preceding decade. There were 216,734 colonies of bees in the province, with a value (including outfit) of \$1,139,559, and a value per hive of \$5.26. Poultry numbered on July 1, 1900, 9,541,241, and were valued at \$2,727,363. There were 890,933 turkeys, 398,890 geese, 457,072 ducks, and the rest scattering. There were 3,164,287 poultry sold or killed during the year, and valued at \$1,176,740. On July 1, 1900, there were 1,771,641 hogs in the province worth \$9,598,153. Those sold or slaughtered during the year were 2,056,049 in number, and \$15,800,799 was received for them—an average price per head of \$7.69, as against \$8.68 in 1895. The number of sheep was 1,797,213, and the value \$7,711,496. Those sold or slaughtered were 690,058 in number, and \$2,872,609 in value. The cattle numbered 2,429,330, and were valued at \$56,320,810. Those sold or slaughtered were 560,893 in number, and valued at \$18,017,989. The horses numbered 617,309, valued at \$46,916,999, the great portion being working animals. Those sold during the year were 47,926, valued at \$3,774,480, or an average price of \$79. There were 2,694,600 acres of pasture ground in the province, 339,411 acres of orchard and garden, 10,687 acres of vineyard.

The cheese factories in operation during the year were 1,173 in number, the cheese made was 127,789,543 pounds, the gross value was \$13,023,025, and the amount paid to patrons for their milk was \$11,682,470. The number of creameries

was 308 in 1900, against 74 in 1895; the quantity of butter made was 9,011,168 pounds, worth \$1,819,290; the average price was 20 cents a pound, and the amount paid to patrons for their milk was \$1,589,291. The wages paid to farm laborers in 1882-1900 averaged \$157 per annum, including engagements, and \$155 in 1900. Without board, the rate was respectively \$250 and \$245.

Fisheries.—The Hon. F. R. Lacombe, Commissioner of Fisheries, presented his annual report on Feb. 25. It showed the net revenue for 1900 to have been \$35,443, and the expenditure \$28,612. The objection to fishermen to giving information was pointed out, owing, presumably, to their fear that it meant increased license fees or some curtailment of existing privileges. Licenses were granted to fishermen with 1,893,000 fathoms of gill-net, 471 pound-nets, 499 hoop-nets, 95 seines, 107 dip-nets, and several thousand baited hooks. The occupation gave employment to 2,502 men, 91 tugs, and 1,187 boats, with an estimated capital of \$789,042 invested in the industry. The aggregate catch was 25,698,591 pounds, a decrease of 1,789,888 pounds on the preceding year, and the value of the product was estimated at \$1,333,293. There was a falling off in the chief food fishes—whitefish, lake trout, herring, and pickerel—and a marked increase in the quantity of the coarser varieties taken. The deputy commissioner said that probably 95 per cent. of the whole catch in these waters was consumed in the United States. The hatcheries were doing good work, and 98,625,000 fry had been deposited in Ontario waters that year for the purpose of replenishing the drain on the whitefish and lake trout.

Mines.—The tenth report of the Ontario Bureau of Mines, prepared by T. W. Gibson, Director of the Bureau, gives the statistics for 1900. The points particularly noted in the report are the satisfactory advance of production in iron, nickel, and copper, the smaller output of gold, and the subsidence of speculative excitement in mining stocks. The number of companies chartered in 1900 was 48, with an authorized capital of \$35,818,999, against 74 in 1899 with an authorized capital of \$87,382,994. The Crown lands sold and granted under patent by the terms of the mines act amounted to 30,972 acres, at a price of \$69,195. There were 267 mining leases issued, covering 28,127 acres and realizing \$27,970 rental. The total value of the product of Ontario mines in 1900 was \$9,298,624, against \$8,416,673 in 1899 and \$7,235,877 in 1898. The number of employees in 1900 was 10,934, and the amount of wages paid was \$3,366,601. The principal products were valued as follow: Lime, \$544,000; brick and drain tiles, \$1,589,328; pressed and paving brick, \$141,369; sewer-pipe, \$130,635; pottery, \$157,449; petroleum and oils, \$1,684,327; paraffin wax and candles, \$184,718; natural gas, \$392,823; salt, \$324,477; building-stone, \$650,342; cement, \$698,015; iron ore, \$111,805; pig iron, \$936,066; nickel, \$756,626; copper, \$319,681; gold, \$297,861; silver, \$96,367. The chief increases during the year were \$153,794 in Portland cement, \$121,693 in petroleum products, \$86,854 in iron ore, \$127,909 in pig iron, \$230,522 in nickel, \$143,444 in copper. The main decreases were \$48,081 in natural gas and \$126,707 in gold.

OREGON. (See under UNITED STATES.)

P

PARAGUAY, a republic in South America. The Congress consists of a Senate of 13 members and a House of Representatives composed of 26

members. The President is elected for four years. Emilio Aceval was elected President for the term ending Nov. 25, 1902, and Hector Carvallo Vice-

President. The ministry at the beginning of 1901 was composed as follows: Minister of the Interior, Guillermo de los Rios; Minister of Foreign Affairs and Colonization, Fabio Queirolo; Minister of Finance, Francisco Campo; Minister of Justice, Worship, and Public Instruction, Dr. José T. Legal; Minister of War, Gen. J. A. Escarra.

Area and Population.—Paraguay has an area of 157,000 square miles. The population was estimated in 1898 at 432,000 whites and 100,000 Indians. There were about 13,000 foreigners, of whom 5,000 were Argentines, 2,500 Italians, 1,500 Spanish, 1,250 Germans, 800 French, 600 Brazilians, 600 Swiss, 450 Austrians, and 200 British. The number of immigrants in 1897 was 197, in 1898 it was 337, and in 1899 the number was 340, consisting of 113 Italians, 74 Spanish, 37 French, 46 British, and 70 Swiss, Germans, and Argentines. The Government has sold a great part of the public domains in large estates for grazing. The schools numbered 390 in 1897, with 700 teachers and 25,000 pupils. Attendance is compulsory. The college at Asuncion had 15 professors and 205 students in 1898.

Finances.—The revenue for 1898 was \$8,977,299, of which \$4,410,283 were derived from import duties, \$625,942 from export duties, \$950,408 from various taxes, \$417,364 from the agricultural bank, and \$1,073,215 by the issue of paper money. There were \$9,785,000 of notes in circulation at the close of 1898. Metallic money had disappeared, and gold was at a premium of 740 per cent. The expenditure in 1898 amounted to \$8,441,275, of which \$2,712,082 were for salaries, \$1,023,031 for interest and conversion of the debt, \$1,108,474 for the army and navy, and \$1,023,031 for public instruction. The revenue for 1900 was estimated at \$8,065,782, and expenditure at \$8,122,180, of which \$1,846,567 were for the Ministry of the Interior, \$2,469,663 for the Ministry of Finance, and \$645,852 for the Ministry of War and Marine.

A foreign debt of £1,505,400 sterling contracted in 1871 and 1872 was compromised in 1885 after several years of default by the issue of new bonds of the amount of £850,000 and grants of lands to the Anglo-Paraguayan Land Company to be distributed among the bondholders in lieu of arrears of interest. In 1892 interest was defaulted on the new bonds, and in 1895 another arrangement was made by which the rate of interest was reduced, bonds were given for arrears, and guarantees were afforded. The debt in 1900 stood at £994,600. There was also the debt of the Paraguayan Central Railroad guaranteed by the Government, amounting to £786,747, and the Government owed \$42,590 in gold to the National Bank. A debt of \$9,876,500 was due to Brazil, and one of \$12,393,600 to the Argentine Republic. The internal debt, including the note issues, amounted in 1898 to \$12,085,234.

Railroads, Posts, and Telegraphs.—The railroad from Asuncion to Pirapo has a length of 156 miles. The receipts in 1899 were \$1,247,973 from 538,524 passengers and 50,774 tons of freight. The length of telegraph-lines is 600 miles. The number of despatches in 1899 was 58,383. Asuncion is provided with telephones. The number of letters and other mail-matter that passed through the post-office in 1899 was 1,254,864.

Commerce and Production.—Next to the rearing of cattle the most important industry is the cultivation of yerba-maté. The Government has parted with the plantations in which this plant is grown, which are now in the hands of capitalists. The export of timber is large, and about 200,000 hides are exported annually to

Buenos Ayres and thence to the United States and Europe. Tobacco is cultivated, besides corn, beans, and other food products, and the agricultural colonies composed of immigrants from Europe raise fruit, coffee, rice, sugar-cane, peanuts, etc. A colony of Sicilians arrived in 1898. There were 2,500,000 cattle in Paraguay in 1899, and the horses numbered 300,000; mules and asses, 20,000; yaks, 10,000; sheep, 200,000; goats, 40,000; and hogs, 50,000.

The total value of imports in 1899 was \$2,147,838, and of exports \$2,021,023. The export of yerba-maté was valued at \$718,292; hides, \$441,308; tobacco, \$112,488. The number of vessels entered at Asuncion in 1898 was 418; cleared, 408.

PENNSYLVANIA. (See under UNITED STATES.)

PERSIA, an empire in central Asia. The reigning Emperor, called Shah in Shah, is Muzafer Eddin, born March 25, 1853, second son of Nasr Eddin, whom he succeeded on May 1, 1896. The Valiahd, or heir apparent, is Mohammed Ali Mirza, the Shah's eldest son, born in 1872. The Grand Vizier in the beginning of 1901 was Mirza Ali Ashgar Khan, appointed Aug. 11, 1898; Minister of Foreign Affairs, Mushir ed Dowleh; Minister of War, Amir Khan Sedar; Minister of the Interior, Dabir el Mulk.

Area and Population.—The area of Persia is estimated at 628,000 square miles, and the population at 9,000,000. The Europeans do not exceed 1,000. Teheran has about 250,000 inhabitants; Tabriz, 180,000; Ispahan, 80,000. There are numerous colleges supported by the Government in which the Mohammedan laws and religion are taught and both Persian and Arabic literature, with some knowledge of science. The polytechnic school at Teheran is conducted by European professors. Since 1898 the Minister of Public Instruction has introduced schools at Teheran, Ispahan, and other cities in which about 3,000 pupils are instructed on modern lines.

Finances.—The revenue is raised mostly by assessing towns and districts, the quota of each being changed from time to time according to their prosperity, or remitted altogether on account of poverty. The payments are part in cash and part in kind. The first foreign debt contracted by the Shah's Government was a loan of £500,000 obtained in 1892 from a British banking company for the purpose of paying an indemnity for the abrogation of a contract for a tobacco monopoly. This loan was redeemed with part of a loan obtained in 1900 from a Russian banking institution created for the purpose and countenanced by the Russian Government. The latter loan was 22,500,000 rubles in amount, paying 5 per cent. interest and secured by customs receipts. A further Russian loan of 17,500,000 rubles has been under consideration, its object being to provide means for the reorganization of the army.

Commerce and Production.—The fertile parts of Persia produce rice, wheat, barley, and other grains and fruits in abundance. The date-palm grows near the southern coast. Silk is produced in the country southwest of the Caspian, £400,000 worth in 1899, besides 532,546 kilograms of cocoons exported to Europe. Opium is grown in increasing quantities, and the Persian product is prized in Europe for medicinal extracts and in China for smoking. The quantity exported annually is about 3,500 chests, worth £462,000. The annual exports of tobacco are 5,500 tons; of cotton, 9,934,400 pounds; of wool, 9,000,000 pounds. The export of rugs is about £140,000 in value. The value of pearls from Debay, Shargheh, and other places on the Persian Gulf is estimated

at 3,000,000 rupees a year. Lead- and copper-mines have been worked from ancient times. Tin, antimony, zinc, nickel, cobalt, orpiment, manganese, iron, ochre, alum, borax, petroleum, and coal are found, and salt is abundant. The turquoise-mines, which have been operated from early times, yield the choicest stones found in the world. A Russian company has a concession for mining tin and other metals in Azerbaijan.

The value of the foreign commerce was estimated from the customs receipts at £7,500,000 sterling in 1890 and succeeding years, at £9,000,000 in 1898 and the same in 1899, and in 1900 at £10,500,000. The customs duties are 5 per cent. ad valorem for Europeans and from $1\frac{1}{2}$ to 8 per cent. for Persians. The customs duties were formerly farmed out to the highest bidders, who retained about a sixth. The farmers took advantage of the fall in the value of silver to increase their profits, in consequence of which the Government increased the farm money to £250,000 in 1895 and £300,000 in 1898. In 1899 the Government collected the revenues in Azerbaijan and some other provinces. The reform proved successful, and on March 21, 1900, the farm system was abolished altogether. The net receipts from customs for 1901 were expected to reach 400,000. Cotton goods, broadcloth, and other woolen stuffs, sugar, glass, carriages, tea, coffee, mineral oil, and drugs are the leading imports. The principal exports are dates, opium, silk, cotton, wool, carpets, pearls, tobacco, turquoises, rice, cotton stuffs, gum, pearl shells, skins, almonds, cereals, mastic, and horses.

The Army.—The present army is useless, although for nearly a century the Persian Government has employed European military instructors. The troops are raised by levies on the districts and tribes, and those who are taken are soldiers for life. A regular system of conscription was decreed by the late Shah, with service for twelve years, but it has not been carried into effect. The nominal strength of the army is 105,000 men, half of them considered as reserves. The number liable to be called into the service at any time is 53,520, consisting of 35,400 infantry, 3,300 irregular cavalry, 2,500 artillery, 90 camel artillery, and 100 engineers. The number kept under arms is about 25,500.

Railroads, Posts, and Telegraphs.—The only existing railroad in Persia is one built by a Belgian company from Teheran to Shah Abdolazim, 6 miles, completed in 1888. One from Amol to the Caspian was begun and left unfinished. The Russian Government is said to have undertaken to build a railroad from Julfa through Tabriz and Hamadan to Bunder Abbas and a branch to Teheran. In order to preserve the British and Indian trade with southern Persia, which was handicapped by the fact that goods had to be shipped by sea from Bombay or Karachi to Bunder Abbas and thence conveyed by mules or camels through Persia, the Indian Government established a direct caravan route from Quetta through Nushki to Seistan, from which point goods can be distributed all over Persia. In the northern and central parts of Persia Russian goods can be sold much cheaper than those from England or India, owing to the railroad. The trade by the camel route to Seistan has grown so rapidly in three or four years that a railroad from Quetta to the Persian frontier is contemplated. From 600,000 rupees in 1898 the trade by this route grew to 1,200,000 rupees in 1900. The telegraphs have a length of about 4,800 miles, with 7,000 miles of wire. The lines belonging to the Government have a length of 3,700 miles and are farmed

out to the Minister of Telegraphs for £26,000 a year. The post-office is farmed out for £26,000 to the Minister of Posts.

Internal Affairs.—The present Shah has introduced many reforms. He has abolished 8,000 superfluous offices, and has diminished his civil list by 150,000 krams. He abolished the system of farming the taxes. He published an edict of toleration. For the pilgrimages of the people to various holy places he made better provision. The financial reforms are expected to increase the revenue from 40,000,000 to 60,000,000 krams. The additional 20,000,000 krams, about £750,000 sterling, will be devoted to building roads and schools, in starting factories, in improving agricultural land, and in developing the resources of the country in other directions. The army has been reorganized on European models by Russian and Austrian officers. The Russian Government obtained control of the customs, except at Fars and ports of the Persian Gulf, by virtue of the loan made in 1900 to the Persian Government. The Russian officials who supervise the collections have placed obstacles in the way of the development of the new British route from India through Quetta by arbitrarily increasing the duties and by forbidding the Indian traders to go armed. The loan runs seventy-five years. The duties on Russian imports were increased to 5 per cent. in 1901, and the same tariff was imposed on Persian exports to Russia. The Russian Government, by granting a subsidy to steamers and an abatement of duties to merchants, established in 1901 regular steam communication between Odessa and the ports on the Persian Gulf. A great part of the trade that was once British has passed into Russian hands. Armenian merchants of Russian nationality are established in all the centers of population, and Persian traders become Russian subjects because as such they can secure the better protection of their rights and interests. The Armenian and Russian languages have been made obligatory subjects of study in Persian schools. New loan negotiations with Russia gave rise to suspicion and discontent in the summer of 1901. Members of the royal family participated in a movement against the Grand Vizier, who was denounced as having sold the interests of the country and blamed for not introducing reforms demanded by the people. Revolutionary placards were posted in Teheran, but the seditious movement was stopped by arresting and punishing their authors.

PERU, a republic in South America. The Congress consists of a Senate of 48 members and a House of Representatives containing at present 108 members. Members of both houses are elected for six years by the electoral colleges of the provinces, the deputies to which are elected by parochial electoral colleges. The President and the two Vice-Presidents are elected for four years by the direct vote of the nation. The President of the republic for the term beginning Sept. 8, 1899, is Eduardo de Romaña. The Vice-Presidents are Isaac Alzamora and Federigo Bresani. The Cabinet constituted on Oct. 31, 1900, was composed of the following members: President of the Council and Minister of Finance, Domingo Almenara; Minister of Foreign Affairs, F. de Osma y Pardo; Minister of Justice, Worship, and Public Instruction, Rafael Villanueva; Minister of the Interior and Police, Col. Zapata; Minister of War and Marine, Col. Portello; Minister of Public Works, Agustin Tovar.

Area and Population.—The area of Peru is estimated at 695,733 square miles. The population was officially estimated in 1896 at 4,609,999, exclusive of tribal Indians, who are numerous in

unexplored regions. In 1876 the census showed 2,621,844 persons. Instead of having increased, it is the opinion of independent observers that as the result of the foreign and civil wars and the neglect of sanitary precautions the population had decreased and does not now number more than 1,500,000.

Finances.—The revenue in 1899 amounted to 13,701,370 soles, and expenditure was 12,817,910 soles, not reckoning, however, liabilities incurred which remained unsatisfied because there were no appropriations. In 1900 the Congress failed to sanction the budget, in which revenue was estimated at 13,850,000 soles, and expenditure at 14,220,000 soles. Customs duties were expected to produce 6,890,000 soles; taxes, 5,267,000 soles; the salt monopoly, 600,000 soles; posts and telegraphs, 373,000 soles; and various sources, 720,000 soles. Of the expenditure 420,000 soles were for the Congress, 3,000,000 soles for the Ministry of the Interior, 800,000 soles for the Ministry of Foreign Affairs, 1,300,000 soles for the Ministry of Justice, 5,000,000 soles for the Ministry of Finance, 3,200,000 soles for the Ministry of War and Marine, and 500,000 soles for the Ministry of Public Works.

The foreign debt of Peru, amounting, with arrears of interest, to £22,998,651, was assumed in 1890 by the Peruvian Corporation. The internal debt is 46,003,000 soles.

The Army and Navy.—The standing army consists of 1,940 infantry, 625 cavalry, and 510 artillery; total, 3,075 officers and men. The navy consists of the cruiser Lima, of 1,700 tons, an armed transport, and 2 smaller steamers.

Commerce and Production.—The staple agricultural products are cotton, of which 6,172 tons were exported in 1898 and 5,876 tons in 1899; coffee, of which the export was 1,245 tons in 1898 and 1,215 tons in 1899; and sugar, covering 187,000 acres, the export having been 103,712 tons in 1898 and 102,789 tons in 1899. The Peruvian Corporation, which received 2,750,000 acres of Government lands, has introduced coffee-growing in central Peru. The guano islands seized by the Chilean Government in the war with Peru and Bolivia were restored and turned over with other public property to the Peruvian Corporation. Money obtained by Chile from sales of guano is held in escrow by the Bank of England. Cacao, rice, tobacco, wine and brandy, and corn are produced in various parts of the country. The coca plantations of La Libertad, containing 2,700,000 trees, produced 3,600 kilograms of unrefined cocaine for export to Hamburg in 1899, besides small shipments to New York and London. Cinchona and other medicinal plants of various kinds and dyes are minor articles of export. The export of sheep's wool in 1898 was 1,280,000 kilograms; of llama wool, 176,800 kilograms; of alpaca, 2,030,700 kilograms. The quantity of rubber shipped down the Amazon from Iquitos is more than 1,500 tons a year. There were 4,714 mineral claims in 1899, a large proportion of which were not worked. They include gold, silver, copper, lead, zinc, borax, quicksilver, coal, phosphate, salt, and sulfur mines and petroleum-wells. The number of mines in operation in 1901 was 2,500, giving employment to 70,000 workmen. The political stability created by the administration of Nicolas de Pierola and preserved under that of President Romaña has given rise to a great deal of mining, agricultural, manufacturing, and commercial enterprise, and this expansion has resulted in a marked improvement in the public finances. A company has been formed with Peruvian capital to drain the flooded silver-mines of the Cerro de Pasco. The high-grade copper ores

of this district are a more valuable national asset than the silver. American capitalists have studied the means of developing the copper-mines. The ore can be smelted with coal found in the neighborhood. The production of ore in 1901 was about 10,000 tons, containing 2,000 tons of copper. Other districts of Peru are also rich in copper. The production of sugar has almost doubled in ten years, amounting to about 140,000 tons in 1901. The cultivated area has been increased, and in a few years the crop is likely to reach 200,000 tons. The cane can be ground at any season of the year in Peru, and as the fields are irrigated it can be planted or cut at any time, but central machinery can not be employed as in Cuba, as the sugar lands lie in small valleys. Peruvian sugar is exported to the United States and Chile in increasing quantities, while exports to Great Britain, until lately the principal market, are diminishing.

The total value of imports in 1899 was 21,230,183 soles, and of exports 33,615,311 soles. Imports of cotton cloth were valued at 3,770,317 soles; provisions, 2,380,950 soles; woolen stuffs, 1,451,361 soles; furniture, 1,324,489 soles; wines and liquors, 365,856 soles. The mineral exports were valued at 10,667,013 soles; exports of sugar, 10,103,518 soles; of wool, 3,118,066 soles; of cotton, 1,787,478 soles; of hides, 783,440 soles; of cocaine, 675,075 soles; of borax, 611,124 soles; of coffee, 484,050 soles; of rice, 426,591 soles.

The values of imports from and exports to the several foreign countries in 1899 is given in soles in the following table:

COUNTRIES.	Imports.	Exports.
Great Britain	7,571,151	14,854,540
United States.....	2,183,109	5,146,531
Germany.....	3,451,516	3,357,231
Chile.....	1,525,656	4,940,373
France.....	1,733,954	749,626
Belgium.....	591,919	197,379
Italy.....	766,532	33,162
Bolivia.....	52,133	626,066
Ecuador.....	81,276	335,416
Spain.....	146,621

Navigation.—The number of vessels entered at the port of Callao in 1899 was 488, of 611,163 tons, not counting 866 below 50 tons, having an aggregate tonnage of 12,024; cleared 486, of 613,975 tons, excluding all below 50 tons.

The merchant navy in 1898 consisted of 63 sailing vessels, of 26,752 tons, and 4 steamers, of 3,413 tons.

Railroads, Posts, and Telegraphs.—The length of railroads at the end of 1898 was 1,035 miles. The Government delivered to the Peruvian Corporation 844 miles, which with the railroads in the territory occupied by Chile had cost £36,000,000 sterling. The railroad terminating at Oroya will be carried on 80 miles farther to Cerro de Pasco, a concession for twenty-five years having been given to the contractor who has undertaken to build the extension through the mountains. The gross receipts of the railroads worked by the Peruvian Corporation were £427,365 in 1900, including those of the steamboat lines on Lake Titicaca and the Desaguadera river; operating expenses, £251,621; net receipts, £175,744.

The Government operated 1,400 miles of telegraph in 1897 and the Peruvian Corporation 533 miles. The number of messages was 121,492. There are 2,300 miles of telephones. The post-office in 1898 transmitted 12,190,000 pieces of mail-matter; receipts were 605,000 soles, and expenses 676,890 soles.

Political Affairs.—In the spring of 1901 the Peruvian representative in Santiago was recalled,

and the legation in the Chilean capital was abolished. In view of the unforeseen advantages Chile had reaped from the province of Tarapaca, which was annexed as the result of the war between the two countries, it was hoped in Peru that Chile would raise no difficulties in the way of the restoration of Tacna and Arica to Peru under the terms of the treaty of Ancon, concluded in 1883 and providing for a popular vote in those provinces at the end of ten years to determine whether they should be Chilean or Peruvian. When the stipulated time arrived Peru, on account of domestic disturbances, was not ready to act. Chile at that time seemed ready to give up the provinces if a satisfactory arrangement could be made with Bolivia. Later she made public improvements in the occupied territories and colonized them, and in the negotiations regarding the conditions of the plebiscite and in public declarations of policy has indicated a determination to retain these provinces permanently. Peru wished the question of the plebiscite to be submitted to the arbitration of a disinterested power, but to this the Chilean Government has steadfastly declined to agree. The Peruvian contention was that the original Peruvian inhabitants of the provinces should determine by the votes whether they be Chilean citizens or return to their former allegiance. The Chilean construction of the treaty, which is the more obvious one, is that Chileans and others who have settled in the territory since its occupation have an equal right with the Peruvian inhabitants regarding the fate of the provinces.

The internal situation of Peru in 1901 was free from disquietude. President Romaña, who at the time of his elevation had to face considerable hostility, succeeded in assuaging opposition by showing a disposition to work honestly for the good of the country. The corrupt practices formerly in vogue in the departments of the Government have been in a great measure extirpated, and system and order have been introduced where formerly there was neglect and confusion. The improvements in the spirit and the methods of the internal administration initiated by President Pierola have been faithfully carried on by his successor. The differences between the Peruvian Corporation and the Government have found no solution. In July arms and ammunition were imported and the reserves were partly mobilized in view of the critical state of the dispute with Chile, which the Government, with the support of most of the South American republics, wished to bring up before the Pan-American Congress at Mexico. Notwithstanding increased military outlay, the budget for 1902 was balanced with a surplus of 1,500,000 soles. The accounts for 1901 showed a surplus. When Congress met on July 29 President Romaña received assurances of the adhesion of all parties.

PHILIPPINE ISLANDS, formerly a colony of Spain, annexed to the United States by virtue of the treaty of Dec. 11, 1898. The islands were under military government in the beginning of 1901. The military governor was Major-Gen. Arthur MacArthur. There are about 600 islands, of which only 11 are of importance. They extend about 2,000 miles from north to south. There are steep volcanic ranges running through them. The forests cover large areas and there are immense swamps. The climate is moist and trying.

Area and Population.—The archipelago is divided geographically and in respect to the character of the population into the island of Luzon, the Visayan Islands, and Mindanao, with the Sulu Islands. The total area is estimated at 129,-

853 square miles and the population between 8,000,000 and 9,000,000. The population of Manila, the chief port and political capital, is about 350,000; of Lipa, 40,730; of Batangas, 39,360; of Laoang, 34,900; of Cebu, 35,240; of Argao, 34,050; of Albay, 31,000; of Taal, 33,380; of Carcar, 30,300; of Callayog, 30,250. The European residents in the islands are estimated at 25,000 in 1899. The largest island, Mindanao, with an area of 47,864 square miles. The estimated area of Luzon is 40,024 square miles. The other large islands are Samar, Negros, Panay, Mindoro, Leyte, Palawan, Cebu, Masbate, and Bohol. Leyte, formerly supposed to contain 2,713 square miles, has been found by recent surveys to have an area of 4,214 square miles. The area of the Sulu archipelago is 787 square miles. The number of Europeans in the islands, exclusive of the military, is about 25,000. There are about 100,000 Chinese, in whose hands are most of the principal industries. Further Chinese immigration was prohibited early in 1901 for the benefit of native labor and enterprise, although Chinamen are better qualified for manual labor and for carrying on the retail trade. The entire provincial trade has always been in their hands, the indolent habits and untrustworthy character of the natives rendering them unfit for business. The occupation of the islands by the Americans led to some white immigration, chiefly from the United States, and many American soldiers on receiving their discharge at the end of the term of enlistment have settled in the country.

Commerce and Production.—The Philippines were populous and productive even before their discovery by Europeans. The chief products are sugar, Manila hemp, tobacco, copra, coffee, and indigo. Rice, flour, wine, textile goods, kerosene oil, and coal are the largest imports. Hemp is exported mainly to the United States and Great Britain, sugar to China, the United States, and Europe, sapan-wood to China and Japan, cigars to Asia and Europe, leaf tobacco to Europe, and copra to Europe. Owing to the blockade of the smaller ports and the retention of produce by the insurgents, the exports were less in 1899 than in 1898. The export of hemp was 167,545,825 pounds, against 221,057,813 pounds; of sugar, 208,440,940 pounds, against 398,036,241 pounds; of sapan-wood, 760,000 pounds, against 2,614,133 pounds; of cigars, which are made in Manila, 134,849,000, against 129,840,000; of leaf tobacco 116,962 quarters, against 145,055 quarters; of copra, 38,842,933 pounds, against 35,330,133 pounds. Coal is found in many of the islands, and mines close to the sea have been opened in Cebu. Copper and silver are found. Iron has long been worked in Luzon. In Cebu a lead-mine is in operation. Petroleum has been discovered in several of the islands. The gold-fields of Luzon have attracted many American miners, some of whom have made their way into the country against the regulations and settled among the natives, while most of them have waited for order to be established and the mineral territory opened for the location of claims. Gold is found in all parts of the Philippines, and the natives have been skilful in washing for gold from early times. Most of the placer deposits have been therefore worked out. In the country of the Igorrotes, in northern Luzon, is an important gold-field which the natives guard from strangers, allowing no one to prospect even for quartz. They extract gold from quartz themselves by a crude process, pulverizing the ore with stone hammers, grinding the crushed quartz, and washing out the gold in coconut shells. In Camarines Norte, southeast

of Manila, is another gold-field. The northeast parts of Mindanao are believed to be very rich in gold, and it is found in the adjacent islands. The Igorrotes of Luzon are skilful in working copper also. Near Mount Data they have mined the metal for ages and make kettles of all sizes and a variety of implements. Other minerals of the Philippines are sulfur, kaolin, and marble. Platinum has been found in Mindanao. In the Sulu Islands are pearl fisheries. Hemp is produced in the Visayan Islands and in Mindanao, while tobacco and rice are grown in Luzon. The Mohammedan inhabitants of Mindanao gather edible birds'-nests on its shores and in the neighboring islands. For thousands of years there has been a trade between the Philippines and China in this delicacy and in sea-cucumbers, dyewoods, and gold, which last article was in ancient times the most valuable product of Luzon. Large herds of horses, cattle, and carabaos are raised in Mindanao, in which the most extensive and valuable forests are found. Coffee grows wild in that island. Fruits are abundant in the Philippines, including the pineapple, banana, sapote, mangosteen, orange, and lemon. Trade suffered greatly in 1900, owing to the closing of large districts where insurrections broke out and the suspension of agriculture over the greater part of the islands. There is a railroad, 120 miles long, in Luzon, the property of a British company. The telegraphs in the islands have a length of 720 miles. The principal banking-houses, the largest export and import houses, and the engineering and shipbuilding industries are carried on by British firms, and most of the shipping is British. Of the area capable of cultivation only a small part is tilled by the natives, who as a rule content themselves with growing a sufficiency for their subsistence, although there are few tropical products which could not be raised in the archipelago. The endemic cattle disease is a great drawback to agriculture. The opening of the ports after the termination of organized hostilities on the breaking up of the Filipino revolutionary government after the defeat of Aguinaldo's army and his flight led to a great increase of trade in the early months of the fiscal year ending June 30, 1901. There was a demand for imported goods to replenish exhausted stocks, and native products for export had accumulated. On a return to normal conditions the market depended upon trade with the interior, the condition of which depended on the progress made in the pacification of the different parts of the country. A Philippine tariff similar to that made for Porto Rico was drawn up at Washington and promulgated early in August, 1901. It was expected to produce a revenue of \$15,000,000 and incidentally reduce imports from other countries besides the United States and Spain to their advantage, and protect Philippine industries against the rivalry of other islands in the Pacific and Indian Oceans. The United States Supreme Court decided that the tariff, not having the sanction of Congress, therein differing from the Porto Rican act, was illegal, as the Philippines were not foreign territory, but territories appurtenant to the United States, the exact status of which, and that of the Filipinos, remained to be determined by Congress.

The Insurrection.—In the beginning of 1901 the American troops had posts all over the islands from which they made constant expeditions into the surrounding country at small cost. There were 60,000 soldiers and a small naval force. It was difficult to watch the coasts, and when the Filipino rebels were driven from one island they escaped to another, and there began operations afresh. They were unskilled and badly armed,

but sufficiently well led to avoid general engagements and to confine themselves to attacking the lines of communication. Their system of secret communication extended all over the islands. Many of the officials appointed by the Americans aided them, and very few of them were willing to risk their lives by informing on them. The rebels of the Filipino army who surrendered in many cases buried their arms first. The members of the guerrilla bands that still kept an army of 60,000 American soldiers busy could not be caught because when hard pressed they had only to conceal their arms, and were then peaceful inhabitants, claiming to be *amigos* until the soldiers had retired from the neighborhood. The deportation of the leading rebels and the confiscation of their property had a marked effect in checking native hostility. The Federal party, whose main principle was the sovereignty of the United States, with liberty to each citizen to pursue peacefully his political ideas, declared that the hour of peace had sounded, and won multitudes of adherents throughout the archipelago. The party heads, in a message sent to Washington in January, 1901, said that the more obstinate Filipinos declined to join the movement because, although they also were willing to accept American sovereignty, the prospect of an indefinite military government caused them to distrust the purposes of the United States, and thus delayed their submission. Congress was therefore petitioned to authorize the establishment of a purely civil government. Emilio Aguinaldo and the other rebel leaders at this time found no difficulty in finding money to keep their followers in the field. Citizens of Manila made secret donations to the cause, and hemp and other commodities were smuggled out of the country, paying heavy toll to the insurgents. The question of the friars was one of the principal causes of the hostility to American rule. The United States in the Paris treaty guaranteed the property of the monastic orders. The Spanish monks, possessing much of the richest land in the islands, were landlords and employers, and under the Spanish *régime* they filled the important cures and were allowed by the officials to exercise all civil authority in their parishes and districts. In the collection of church dues the monasteries ruthlessly despoiled the natives in much the same fashion as the civilian officials. The state and the clergy worked together in exploiting the people, and this was the cause of the great rebellion against Spanish rule. The most pressing demand of the revolutionists was the expulsion of the friars, and when the insurrectos became masters of the country they expelled them. The fear that they would be restored with the same powers under American rule helped to keep the rebellion alive. Monsignor Chapelle, who was sent by the Vatican as papal legate to report on the reconstruction of the religious institutions of the islands under American rule, found that in the absence of any control over the exercise of authority by the religious orders numerous abuses had arisen. The necessity of reform was recognized by the Vatican no less than by the American authorities.

After the enlightened and influential men among the Filipinos, including most of the leaders of the rebellion, accepted American sovereignty unreservedly, the military authorities had no difficulty in securing the aid of natives for military purposes. It was the local officials who were beyond the reach of supervision or protection and under the power and influence of insurrectos and ladrones who could not be trusted to be either loyal or honest. The Macabebe scouts proved

efficient and trustworthy auxiliaries. Among the insurgents the Americans had their spies and helpers, and they gained much information from those who were constantly coming in to give themselves up. As long as Aguinaldo, the president of the Filipino republic, remained at large, the rebellion could not be considered at an end. The leaders of rebels and ladrones who carried on operations independently in their own districts, often mainly for their own profit, however willing any of them might be to supplant or overthrow Aguinaldo if the Americans should evacuate the islands, all recognized his authority as head of the insurgent government. Although army and government and organized insurrection had ceased to exist and his direction was practically nil, still in him was personified the idea that enabled them to control their followers and levy tribute on the people. That wily chieftain, whose death had been reported to the Americans more than once, if he were to take the field at the head of a rebel band would invite a development of military strength that would soon lead to his being cornered and captured. He therefore hid himself for a long time in inaccessible retreats with only a few followers, keeping up communication with the active insurgents by means of couriers. In the beginning of February he decided to take a more active part in the rebellion, and accordingly sent out despatches ordering Simon Tecson, Sandico, and Baldomero Aguinaldo to send him troops. Cecilio Segismundo, who bore the letters and was expected to guide the first of the columns to Aguinaldo's hiding-place at Palanan, in the province of Isabela, delivered the letters into the hands of the Americans. Brig.-Gen. Frederick Funston thought out a ruse by which he could capture Aguinaldo, and submitted it to Gen. Wheaton. He was called to Manila to talk it over with Gen. MacArthur, and the commanding general, thinking that so great a stake was worth a great risk, gave his consent. Gen. Funston selected from his command in Nueva Ecija a company of 81 Macabebes who were familiar with the Tagalog tongue, steady, intelligent, and of good marching qualities. They were taken to Manila, and with them Hilario Placido, a Tagalo known to Aguinaldo, Lazaro Segovia, a Spaniard, Dionisio Bato and Gregorio Cadhit, Tagalos and ex-officers of the insurgent army, and Segismundo—Placido to play the part of the chief of the column, the Spaniard that of captain of the company, the Tagalos to act as lieutenants, the Macabebes as privates in a company of reinforcements sent according to his orders to Aguinaldo's camp, to which Segismundo should guide them according to directions. They were taken on board the gunboat Vicksburg and made to look as much as possible like insurgent soldiers by dressing them in uniforms of Aguinaldo's army, partly in the clothing of the country, which the rebels habitually wore since that army was broken up, so they could change themselves from combatants to non-combatants by simply concealing their rifles in a clump of bamboo. A Tagalo penman in San Isidro skilfully forged at the bottom of some sheets of writing-paper captured by Gen. Funston which bore the official seal of Gen. Lacuna the signature of that insurgent leader, and above this signature were written on two of the sheets two decoy letters to Aguinaldo. The Americans on the expedition were Gen. Funston, his aid, Lieut. Mitchell, Capt. and Lieut. Hazzard, the real officers of the Macabebe company, and Capt. Newton, who had been in Casiguran before on a daring adventure. These officers were disguised in the uniforms of Ameri-

can privates, part of a surveying party which the insurgents were supposed to have captured on the march, having killed the rest. The expedition started from Manila on March 6, landed in Casiguran Bay on March 13, marched 20 miles along the beach to the town of Casiguran, where they obtained a scanty supply of provisions from the alcalde, and on March 17, having sent forward to Aguinaldo the two forged letters of Lacuna and one from Hilario Placido, the pretended Filipino colonel, giving notice of the coming of his party with the American captives, they set out for a march of 90 miles by a muddy and rocky trail through woods, over mountains, across streams and swamps, and along the beach of the sea. When they came within 8 miles of Palanan an order was received from Aguinaldo to leave the Americans there. After marching a short distance a note was sent back to the Macabebe guard by Segovia saying that another messenger from Aguinaldo brought word for the prisoners to be sent on. This was shown to the Tagalo in charge of workmen who were building huts to shelter the American prisoners, and the officers with their guard of 11 Macabebes hastened after the main body, hiding in the bush when they met a party of Tagalo soldiers who were sent out to guard them in the huts. The column had in the meantime reached the Palanan river, and Segovia and Hilario were taken across to report to Aguinaldo, who was surrounded by 8 officers of his staff. While Segovia was telling a long story to fill the time, the Macabebes crossed in boats and lined up in front of Aguinaldo's escort, standing in line to receive them. As soon as the American officers came in sight on the opposite bank Segovia stepped out on some pretext and gave the order to Gregorio Cadhit, who shouted, "Now, Macabebes, your hour has arrived." The Macabebes in great excitement fired a ragged volley at the Tagalos drawn up near them, and these fled instantly, some throwing down their arms, 2 having been killed. Aguinaldo, thinking that the men were shooting to celebrate, stepped to the window and told them not to waste their ammunition. Hilario thereupon seized him and threw him to the floor, telling him that he was the prisoner of the Americans. Segovia fired at the others with his revolver, wounding Col. Villa, Aguinaldo's chief of staff. Dr. Santiago Barcelona, Aguinaldo's treasurer, gave himself up, but the others jumped through the window into the river. The Macabebes thronged in, and would have killed Aguinaldo if the American officers had not come up in time to prevent it. Aguinaldo's capture was effected on March 23, and on the following day the Vicksburg took the party on board in Palanan Bay and steamed back to Manila. Aguinaldo took the oath of allegiance to the United States and recognized the supreme authority of the American Government in the Philippines. On April 19 a manifesto declaring his allegiance to the United States was issued in his name. Col. Gonzalez, the insurgent governor of Manila province, surrendered at Malabon with his military staff and civil officials a few days after Aguinaldo's capture. After the publication of Aguinaldo's manifesto surrenders became frequent. Gen. Cailles gave himself up to Gen. Sumner on June 24, with his officers and 650 soldiers. On July 5 Gen. Bellarmino surrendered, with 1,000 men. Major-Gen. Adna R. Chaffee succeeded Gen. MacArthur as military governor of the Philippines on June 22. Col. Grant, while making a reconnaissance in the province of Batangas, captured Col. Martin Cabrera, an important leader. Gen. Mascardo surrendered in May, with 21 officers and

321 men. Aguinaldo had made an offer to secure the surrender of all the insurgent leaders on certain terms. The proposals were referred to Washington, and the Government declined to bargain with him, though any aid that he rendered would be taken into consideration in determining his future. Major Alhambra, who escaped by swimming when Aguinaldo was taken, remained in the neighborhood with Aguinaldo's body-guard. After he had kidnaped the alcalde of Casiguran on Sept. 12 he was pursued by a force which went to Baler on a steamer, and on Sept. 20 he surrendered, with 31 officers and men and their rifles. Between June 10 and Sept. 15 the number of Filipinos who gave themselves up was 361 officers and 3,638 men, while 26 officers and 494 men were captured. The officers captured were deported to Guam when their loyalty could not be depended upon. Aguinaldo was kept under guard in Manila. Excepting Malvar in Batangas province and Lukban in Samar, there were no important leaders still under arms in Luzon. In Batangas and Tayabas the worst form of guerrilla warfare was carried on by bands which were distributed along the roads and trails, lying in wait for travelers. Caballos, who refused to surrender with Gen. Cailles, was driven by the troops into the mountains. When the troops succeeded in breaking up the bands in Luzon and occupying the country so thoroughly that they could not carry on their operations, the rebels who were not captured or returned to peaceful occupations escaped to Samar and joined the force of Gen. Lukban.

In September there was a recrudescence of conspiracy and rebellion. A branch of the Katipunan Society was discovered at Tarlac, of which the presidente of Banoang, Marcelino Marivilla, was suspected of being the organizer. Some of the recently armed native constabulary joined the movement, the object of which was a sudden rising and slaughter of the whites. The police force at Banan, in Batangas, was disarmed. Some of the police and civil officials were placed on trial for furnishing information to the insurgents. When Major Braganza, an insurgent officer, was caught he was sentenced to be hanged for having massacred 103 Spanish prisoners. Miguel Malvar went over from Batangas into Bulacan province, where he enlisted men to recruit his force. The introduction of autonomous local administration gave opportunities for the fomentation and organization of insurrection. On the other hand it gave assurance to the peacefully and industrially inclined, who form the bulk of the agricultural population, that their apprehensions were unfounded. The people in the pacified parts of the country manifested a lively interest in their local affairs and in the promotion of reforms under American supervision. The expenditure of all the fines that were collected on schools and public works was a feature of American administration that they appreciated highly. Autonomous administration was introduced gradually, and was superintended in all its details by the American officers, as the Filipinos expect and require a large degree of paternal government. The successive formation of superior representative bodies encouraged the natives to take an active part in the management of local and provincial affairs, such as the construction of schools, public buildings and roads, the regulation of rivers, and the assessment and collection of taxes. Where local funds were insufficient the American Government came to their assistance. In the summer over 50 local representative bodies were in operation in Luzon. Local magistrates were appointed who were selected from among the lawyers of the

country and officials attached to the courts under the Spaniards. The policy of the Government was to appoint natives to all the offices for which fitting candidates could be found among them. To teach in the schools English and the elements of American education 600 qualified teachers were brought over from the United States and distributed by Superintendent Atkinson throughout the country in the districts where civil government had been introduced. Their situation was rendered more uncomfortable than they expected by the revocation by the military authorities of the order allowing commissary supplies to be sold at cost to civil employees as well as to the army, and they complained against this as a violation of the understood conditions on which they were engaged. In the commissary department a scandal occurred, the stealing and selling of stores by two or three officers in connivance with merchants, that was a blot on the American administration. An officer, too, was accused of abetting foreign and American traders in illicit trading with insurgents in the blockaded ports. These isolated instances, instead of undoing the effect of the example of honesty and duty set before the natives, by the punishment of the offenders confirmed their respect for the honesty and disinterestedness of the American military administration, in contrast with the corruption and extortion of the Spanish régime. The United States forces in the Philippines were composed of the best material for dealing with guerrillas, possessing not only courage and the strength to bear fatigue, but quickness of sight, marksmanship, and capacity for individual initiative. During the three years from June 30, 1898, till June 30, 1901, the number of soldiers who served in the Philippines was 3,477 officers and 108,800 enlisted men, 61,275 of the total being regulars and 50,002 volunteers. Of the total number 619 were killed and 219 died of wounds. The deaths from all causes were 3,493. The percentage of desertions was 4.3. Of the non-commissioned officers 200 were commissioned. The army in the Philippines in September numbered 43,239 officers and men. In the middle of September the provinces of Batangas and Laguna in Luzon, and the islands of Samar, Mindoro, Cebu, and Bohor were the only areas disturbed by armed bodies of insurgents. In order to guard against the mischievous action of Sixto Lopez and other emissaries and agents of the insurgents who were seeking sympathy and aid in the United States and Europe, the Philippine Commission made a law requiring all persons suspected of having aided or abetted the insurgents on arriving in Philippine ports to take the oath of allegiance to the United States.

The confidence of the Filipinos in general in the American administration was evinced by the resumption and extension of agricultural operations except in the disturbed part of Luzon and in Samar. In Mindoro the insurgents were effectually suppressed by a small force under Capt. Pitcher. In Panay all signs of rebellion ceased in the summer. The autonomous civil administration, however, was not satisfactory, owing to the differences between the two principal officials. The provincial governor was Martin Delgado, formerly the commander of the revolutionary forces in the island. José Gay, who was appointed alcalde of Iloilo, had offended him by going over to the Americans, and the feud was continued when Delgado became his superior under American rule. The administration made progress in spite of their quarrels. The people paid their cedula taxes and applied themselves again to the cultivation of sugar and hemp. In Bohor the in-

surgeons were suppressed without difficulty. In Cebu the civil government experienced much difficulty. The insurgents, who were never brought under thorough control, grew bolder when the American garrison was changed. They frequently fired into the town from the hills, and attacked American detachments near headquarters. The civil government was changed by Gen. Chaffee for military rule again. The people there had been made to believe that the Americans would bring back the friars. The uncertainty of American policy regarding religious orders had much to do with keeping the spirit of rebellion alive in all parts of the Philippines. The restoration of the property of the monasteries that the insurgents had confiscated was a certainty, and the persons who had profited by the confiscation or had been guilty of crimes against the friars had strong motives for resisting the establishment of American rule. From the period when the insurgents came into power a growing indifference to religion was observable in all classes. The authorities of the Catholic Church were therefore anxious to have order restored and to give to the people priests who would be acceptable to them.

In Mindanao, peopled by different races of different religions and forms of government, Gen. Kobbe was confronted by problems demanding diplomatic handling. He established friendly relations with the Moros, some of whom cooperated with him in suppressing the Filipino insurgents. The American Government made no attempt to interfere with the native government and customs of the Mohammedan peoples living in Mindanao and Sulu, making no declaration even against polygamy or slavery. The native rulers were left in the independent position they had always asserted under Spanish dominion. Datto Mandi, who rules the Moros about Zamboango, voluntarily issued a proclamation abolishing slavery. Moro children attended the schools opened in Zamboango, which were soon filled in excess of their accommodations. Rufino de Losa, who formerly served under Gen. Capistrano, attempted to raise a fresh insurrection in the summer. In a very short time he was forced to retreat into the mountains, where his men deserted him. In Jolo the sultan waged war against the Dattos Calve and Joakainin. The officers in Major Sweet's command patched up a truce several times, but the difficulties always broke out afresh. They decided therefore to let the quarrelsome chiefs settle their affairs by fighting, which would produce a more lasting peace and would use up their ammunition, which could not easily be replenished under the new regulations. The casualties in two months' fighting, at the end of which the sultan had the rebel chiefs at his mercy, did not exceed 50 men, but many women and large numbers of cattle were carried off.

The Visayan Islands with the exception of Samar were thoroughly pacified, because a vigorous campaign had been necessary to stamp out the insurrection in each of them. In Panay, now prospering under civil rule, 4,000 troops had been employed and active operations lasted two years. In Leyte 1,600 troops had required fifteen months to establish American supremacy. They fought 400 engagements, and during the operations roads were constructed as fast as possible. Gen. Hughes, whose command embraced Panay and Leyte, had Samar added to it. The accessions to the rebel force from Luzon gave the insurgents greater influence and control over the natives of the island, who number about 200,000 and are particularly fickle and deceitful Malays, ready to take the oath of allegiance and live for months

on the best of terms with the troops, but open to the influence of the insurgent and capable of any treachery. The island, which had never completely occupied by the Spaniards, had received but little attention from the Americans because no active resistance was offered to their occupation of the coast towns, becoming a base to which all the irreconcilable and outlaws of insurgents and banditti fled for safety when they were driven out of the other Visayan islands and out of Luzon. The bad characters of the whole archipelago gathered there and compelled or prevailed upon many of the natives to join their forces. They violated all the rules of civilized warfare. As this was the principal remaining focus of rebellion a considerable American force, set free by the pacification of the other islands, was concentrated there. Gen. Hughes made progress in fighting the insurgents before the rains set in, about Aug. 1. The insurgents were at least driven away from the hills from which they shot into the town itself, and the troops pursued them with vigor. Gunboats ascended the streams 25 or 30 miles, but were unable to go farther on account of their deep draft. There were 20 American garrisons. On July 26 a body of 500 insurgents surrendered. The rest were split up into bands, the largest numbering not more than 50 men. Samar is a particularly difficult island for military operations, as it is without roads, communications being carried on mainly by water. The surface is made up of wooded mountains and deep valleys covered with swamps and jungle. While active hostilities were in progress in Luzon and in Panay, Negros, and other islands on which the republican government of the Tagalos attempted to introduce its rule, this island was comparatively neglected; and when civil government was installed in most of the islands, this was one of the few left under military rule. Although it is after Mindanao and Luzon the largest of the Philippines, there were only 6 military posts occupied at the beginning of 1901. The island seemed to be under complete control, and civil government was established in the towns after Gen. Hughes had taken matters in hand and posted garrisons in all the towns to protect the authorities and inhabitants from incursions by the insurgents, who had been driven into the central mountains, roving bands of them committing murders and robberies on the defenseless, but not attempting to attack the Americans since the arrival of reinforcements. The insurgents were not believed to have over 300 rifles on the island. The garrison at Balangiga consisted of a company of the Ninth Infantry, 75 strong. On Sept. 28, while the men were at breakfast, the presidente and a party of the townspeople advanced in a friendly manner until they got between them and their stacked rifles, and then fell upon them with their bolos, killing Capt. T. W. Connell, Lieut. E. A. Bumpus, Surgeon R. S. Griswold, and 48 men, while 24, half of them wounded, escaped to Basei. The bodies of the murdered soldiers were mutilated and burned. Some of the attacking party carried rifles which the United States authorities had supplied them with for their defense against the insurgents. When the soldiers of the massacred company took up their quarters in the town a short time before they were received with music and feasts. The result was an entire lack of watchfulness. As soon as the disaster was known at Catabalogan a sufficient force of American regulars and Macabebes was sent to Balangiga, and the inhabitants of the place fled into the mountains. Gen. Hughes soon had 3,600 troops in the island and began a vigorous cam-

paign. The river valleys were effectually occupied by the aid of light gunboats, and flying columns were sent into the hills, giving the insurgents no rest. The central objective of the movement was the Pambujan mountain, in the center of the island. No large bodies of insurgents were found. Before operations were well begun a detachment of 46 men of the Ninth Infantry was attacked on the Gandara river at Bangabon, and 10 men were killed and 6 wounded before the rest of the company came up and put the bolomen to flight, killing more than 100. While the operations for stamping out the insurrection in Samar were proceeding, the marines cooperating with the army on the rivers and ports, Rear-Admiral Frederick Rogers with 27 war vessels, nearly his entire naval force, patrolled the coasts of the island to prevent the escape of the insurgents by sea and the landing of munitions. Gen. Smith, commanding the troops, issued a notice ordering all the people to concentrate in the towns; otherwise they would be considered enemies and treated accordingly. Francisco de Jesus, Gen. Lukban's commissary officer, was captured with papers on his person, implicating many of the chief civil officials of the island of Leyte, and these were arrested. The ports of Leyte were closed and all sales of hemp forbidden except in small quantities in exchange for food under the supervision of the military. The presidentes of Samar were threatened with deportation to Guam if they harbored the persons who committed the massacre of Balangiga or connived in the concealment of arms, and villages were threatened with destruction if guilty of the same acts. Several towns in the south of Samar were destroyed. A detachment of 12 soldiers was attacked at San Antonio by 140 bolomen, and 2 were killed and 2 wounded. Sergeant Willford and the others repelled the furious attack, killing 14 of the enemy. Major Waller shelled the rebel stronghold of Sajopan, near Basei, on Nov. 6, and on the following day stormed the position, killing 26 insurgents, while 2 marines fell in the action.

While the troops were crushing the insurrection in Samar and the budding movement in Leyte was checked before any outbreak, the insurgents of Cebu, who had been led to believe that the American troops were being withdrawn from the Philippines, lost all heart on seeing this development of strength. Their main force, numbering 60 officers and 450 men, surrendered and gave up 150 rifles and 8 brass cannons. The insurgents in Samar, the men who had the rifles, withdrew to the fastnesses of the western part of the island. Simultaneously the insurgents in the disturbed parts of Luzon redoubled their activity. A sharp fight occurred near Candelaria before the end of September, in which 1 American was killed and 1 wounded, the object of Capt. Hearn being to capture some stores of rice and ammunition, which was attained. A detachment of the Twenty-first Infantry and a company of Macabebes, encountering over 300 insurgents strongly entrenched near Lipa, had to retreat. The police of Catanag, in the province of Tayabas, 11 men armed with carbines and revolvers, were reported as having been made captives by the insurgents, but were probably willing captives. On Oct. 24 insurgents attacked San José, in Batangas, and in spite of the spirited defense offered by the garrison succeeded in burning the town. At Taysan, in the same province, two companies of the First Cavalry drove a band of insurgents into the mountains and destroyed their camp and stores. In central Luzon, as the result of Malvar's recruiting, bands of from 25 to 50 endeavored to concen-

trate. Notices were posted on church doors urging that the work of organization should be completed by January. Alarm was felt in Manila, where the force was only 1,200, including the metropolitan police, but not the native police, who were not believed to be trustworthy. The United States Government decided to send out fresh troops to replace those whose time had expired.

Gen. Chaffee considered the physical conformation of the country, the nature of the warfare of the rebels, who could be *amigos* and *enemigos* in the same hour, the humanity of the troops, which was taken advantage of by the rebels and the inhabitants in sympathy with them, and the fear of assassination on the part of those who were friendly in case they gave information to the American forces, to be sufficient reasons for the prolongation of the guerrilla warfare. The gradual replacing of military with civil administration and the cessation of interference with civil affairs does not, in his view, involve the withdrawal of troops from their stations to any considerable extent. That should not take place hastily, and when it is undertaken it should be gradual and more in the nature of concentration than of a reduction of force or the abandonment of any considerable area of territory. The military governor advised against any further material reduction of troops before Jan. 1, 1903. The civil government that was being organized is new and untried, and the observation of the army affords the only reliable method of ascertaining the progress of the Filipinos in self-government.

PHYSICS, PROGRESS OF, IN 1901. Mechanics; Constitution and Properties of Matter. *Gravitation.*—Eötvös (International Physical Congress at Paris, Report, 3, p. 371, 1900) has determined by a torsion-balance method the derivatives of the components of gravity in the neighborhood of a point. The method gives indications of underground rocks and their distribution, and is more sensitive than any pendulum method. Bessel's conclusion that attraction is independent of the nature of the attracting masses to within $\frac{1}{100000}$ has been pushed much farther, and it is shown that the sun's attraction is not modified one-hundred-millionth part by the interposition of 1 kilometer's thickness of the earth's crust. Similar methods have been applied to the exploration of magnetic fields. R. A. Fessenden (Electrical World and Engineer, Sept. 29, 1900) explains gravitation as a secondary electric effect. The chief results may be summarized as follow: (1) "All simple dielectrics expand under electric stress. The expansion varies as the square of the electric intensity or voltivity, and inversely as the elasticity." (2) When a dielectric is placed in an electric field, there is a change in the density of the substance, and in the density of the ether. The former gives Kerr's phenomenon, the latter alters the weight of the condenser. (3) The value of the electrostatic stress at the surface of a corpuscle is of the order 10^{20} , and the elasticity of the ether has been shown to be of the order 6×10^{20} . There is accordingly an enormous stress next the corpuscle, producing a change of density whose amount varies inversely with the fourth power of the distance from the center of the corpuscle while the total expansion varies inversely as the square. Newton showed that change of density in the medium around a particle would account for gravitation, and the present method gives an effect of approximately the right order. Thus (4) "inertia is an electromagnetic induction effect due to the corpuscular charge. (5) Gravitation is a secondary effect, the electrostatic intensity due to

the corpuscular charge causing a change of density in the ether surrounding it, this latter giving the gravitational attraction." Grounds are adduced for holding that (6) "gravitational force is propagated at practically infinite velocity as an expansional wave."

Molecular Theories.—J. J. Thomson (Paris Physical Congress Report, 1900, 3, p. 138) elaborates his new theory of subatomic corpuscles, starting from an estimation of the mass of cathode-ray corpuscles in which he concludes that each has about $\frac{1}{1800}$ the mass of a hydrogen atom. We have thus, he says, a new state of matter, consisting of corpuscles whose mass is the same, no matter from what material they may be derived. Each carries a fixed charge of negative electricity. The corpuscular condition is presented not only in cathode and Lenard rays, but also near a metal plate under ultra-violet light, near a filament incandescent in a very high vacuum, and in the radiations from radio-active substances. The author thinks that it also exists throughout metals and causes their conductivity. Under an electric force, the corpuscles in the metal move in an opposed direction with their charges, and the metal appears to carry current. If they travel to a cooler part of the metal, they carry kinetic energy with them; whence thermal conductivity. If we calculate on this theory the ratio of the thermal to the electric conductivity, the result is fairly in accordance with facts, but is not quite conclusive; and the observed ratio is not exactly the same in all metals, as it should be on this theory. Each molecule of bismuth seems to shed and reabsorb corpuscles about 40,000,000 times per second on the average; molecules of other metals much oftener than this. W. Voigt (Annalen der Physik, March) criticizes the older views as to solids. He attacks the theory that the behavior of a solid is expressible by a few constants throughout its substance, including the surface, and also objects to the application of the laws of homogeneous strain without modification to heterogeneous strain. The author concludes that much searching experiment is needed before a satisfactory theory of solids can be framed.

Relations of Ether and Matter.—Kelvin (Philosophical Magazine, July), in discussing the relative motion of ether and ponderable bodies, suggests that as Fresnel's and Young's hypotheses are inconsistent with the elastic-solid theory of ether, we may have to relinquish the doctrine that two portions of matter can not jointly occupy the same space. Ponderable bodies may then be assumed not to displace ether as they move, while each atom alters the density distribution of the ether within the space which it occupies itself. This hypothesis will explain (1) how matter can act on ether so as to produce light, (2) why the speed of light is less in transparent ponderable matter than in pure ether, and (3) the aberration of light. It is inconsistent, however, with Michelson and Morley's experimental conclusion that ether in the earth's atmosphere is motionless relatively to the earth unless indeed the motion of ether through matter alters its linear dimensions. In a subsequent article (ibid., August) the author asserts that we have strong reason for believing the density of ether to be constant throughout space, and that this density (water being unity) should be not less than 5×10^{-18} . He concludes that ether and matter are not mutually exclusive, but may freely occupy the same space, or interpenetrate each other. He also asserts that the mean density of ponderable matter throughout any very large spherical volume in space is less the greater the radius. W. Wien (Archives Néer-

landaises, 5, p. 96, 1900) advances the view that the most promising direction for the future work in mechanics and electricity lies in the reversal of the usual methods, and the seeking of a possible electromagnetic theory of mechanics instead of a mechanical theory of electromagnetism. The writer takes as fundamental the conception of the electric and magnetic polarizations of the ether, and develops his equations from this, assuming also that mechanical phenomena are electromagnetic, and further that what is termed matter is made up of the positive and negative electric quantities or elements which we regard as the convergence points of the lines of force. The ether is regarded as at rest, and the electric quantities are the only ones supposed to change position. All forces are considered to be electromagnetic and due to stresses in the ether. By different groupings of positive and negative quantities at different distances very complex effects may be obtained, and the author thus believes it possible to reconcile Michelson's interference experiment with the theory of the ether at rest. For Lorentz has shown that the length of a body in the direction of the earth's motion is shortened if the molecular forces can be replaced by electrostatic forces. Hence Michelson's result is explained, if we can apply this to the molecular motions. L. Graetz (Annalen der Physik, May 29), in an attempt at a mechanical representation of electric and magnetic phenomena, arrives at the conclusion that in a vacuum ether behaves as an elastic body. In ponderable bodies action takes place between the disturbed ether and the molecules, which action is electrostatic force, those parts of a substance where it continues to exist being ions. Magnetic polarization is the torsion of ether, while electric forces, other than electrostatic, are its translation velocities. The so-called true magnetization has neither existence nor meaning. True electrification is the excess of the included ether above the normal. Electric conduction consists in the motion of molecules. The motions of matter and ether are not independent. The theory can easily be extended to explain the phenomena of dispersion.

Hardness.—F. Auerbach (Annalen der Physik, September, 1900) defines hardness for the case of plastic bodies, including metals, by the limiting pressure per unit surface attainable between a lens and a plate of the same substance. He gives the following table of the hardnesses of various fairly well-defined metals, as compared with minerals:

Steel.....	361	Quartz.
Copper (hard).....	143	
Bronze.....	127	Apatite.
Brass.....	107	Feldspar.
Gold.....	97	
Copper.....	95	Calc spar.
Silver.....	91	
Aluminum.....	52	Boric acid.
Lead.....	10	Gypsum.

C. Benedicks (Zeitschrift für Physikalische Chemie, April 2) notes that the hardness of steel depends on the formation of a homogeneous solid solution of carbide (C_2Fe_3) with iron, while in soft steel the carbide is only mechanically mixed with the iron. As in general a solvent expands only slightly on dissolving small quantities of foreign substances, such solution increases the number of atoms present in a given volume, or the atomic concentration (density \div atomic weight). Bottonne has shown that for 24 pure metals the hardness is proportional to the atomic concentration, but, by Avogadro's law, atomic concentration in gases determines their pressure, and analogy therefore suggests that hardness in simple bodies

may be of the character of a pressure. The hardness of solid solutions—i. e., of alloys—will thus be of the nature of an osmotic pressure, and this conclusion explains the varied hardness of iron when alloyed with different metals.

Viscosity.—R. Reiger (Physikalische Zeitschrift, Jan. 5), from a study of the "time of relaxation" in colophonium gelatin, and chilled glass, finds that in their plastic state these substances show a relaxation in accordance with Maxwell's theory, whereas in the hard state the viscosity rises first to a maximum before relaxation sets in. With falling temperatures the time of relaxation and the viscosity increase rapidly.

Elasticity.—M. Cantone and G. Contino (Nuovo Cimento, 1900) have studied the influence of traction and torsion on the red variety of caoutchouc, and also its thermal expansion. As the load increases there is an increase in the modulus, and not a diminution as postulated by Villari and Röntgen. This is opposed to the behavior of the metals. As regards torsion, the material behaves in essentially the same manner as do the hard metals. Rudeloff has investigated the influence of heat on elasticity in cast iron, cast steel, beaten bronze, and lead by bending and stretching rods at various temperatures. Most metals were found to be as strong for small loads at fairly high temperatures as at low temperatures; but for greater loads they are much weaker. A. Gray, V. J. Blyth, and J. S. Dunlop (Royal Society Proceedings, Oct. 31, 1900) have determined the Young's and rigidity moduli of metal wires at different temperatures between that of the atmosphere and 100° C. German silver, mild steel, brass, copper (commercial), copper (hard-drawn electrolytic), and soft iron were tested. In determining the rigidity moduli by the vibration method, the authors noticed that the decrement of the vibrations appears to be a function of the temperature and of the amplitude. In German silver the decrement is smaller at the high temperatures instead of larger as in the others. A. Lafay (Annales de Chimie et de Physique, June) has measured the deformations of two steel or bronze spheres in contact under different pressures; also the deformations when a sphere is in contact with a plane surface. Hertz's mathematical analysis of the problem only imperfectly represents the real phenomena, and in particular his conclusion that the diminution of distance between centers of two bodies varies as the two-thirds power of the pressure is only true where the deformations are relatively large. The divergence from theory becomes greater as the deformations become less, notwithstanding the fact that the theory is based on conditions of small deformation.

Rigidity.—T. C. Hebb (Transactions of the Nova Scotian Institute, 10, pp. 273-286, 1900) has confirmed the experiments of W. A. Macdonald which show that the rigidity (kinetically determined) of a fresh or partially fatigued vulcanized rubber cord, when subjected to increasing tension, at first diminishes, then reaches a minimum, and finally increases. In the case of a sufficiently fatigued cord, the minimum point seems to disappear. Increase of tension in a cord that has been stretched for some time immediately decreases the rigidity, but if the cord is left under the tension the rigidity increases again.

Polish.—Rayleigh (Nature, Aug. 15) states that with finely ground, as distinguished from polished, glass surfaces, such fineness may be attained that a candle is seen reflected at an angle not exceeding 60°, measured from the perpendicular. Such surfaces are still too coarse for per-

pendicular specular reflection of the longest visible waves of light, although they are fine enough to reflect without sensible diffusion the waves one hundred times longer than those of red light. The balance of evidence, however, indicates that grinding and polishing are essentially different. In grinding, the powder hits the surface, breaking out small fragments, while polishing is in all probability a molecular operation, no coherent fragments being broken out. In one case the author finds that a thickness of about six wave-lengths of mean light was removed during the polishing of a piece of glass; in another case, with very finely ground surfaces, polishing lowered the mean surface two or three wave-lengths.

Liquids and Gases. Kinetic Theory.—Jeans (Philosophical Transactions, May 22) notes that if the mean kinetic energy is the same for each degree of freedom as postulated in the Maxwell-Boltzmann theory of gases, results follow which are irreconcilable with experiment. But he remarks that Boltzmann's law of distribution of energy is proved to be the necessary law only if certain conditions postulated by Boltzmann are fulfilled. It fails altogether if there be dissipation, even though the conditions in other respects are fulfilled. There is dissipation if we admit any interaction, however small, between molecules and the surrounding ether. That such interaction exists is proved by the phenomena of radiation. He finds that the second law of thermodynamics will not generally hold for a gas emitting radiation.

Solution.—L. Bruner and S. Tolloczek (Zeitschrift für Physikalische Chemie, Nov. 2, 1900), in experiments with gypsum, acetanilid, phenylacetic acid, phenylpropionic acid, and benzoic acid, have confirmed the formula of Noyes and Whitney, according to which the velocity of solution is logarithmic. In addition, they have determined the value of the constant per square centimeter of surface. The system, solid substance—unsaturated solution, is considered to be practically unrealizable, and the solid substance is regarded as being in contact with a layer of saturated solution from which diffusion takes place into the surrounding liquid. The constants found are therefore diffusion—constants. N. Schiller (Annalen der Physik, May 29), in a thermodynamical investigation of the saturated solutions as modified by varying external conditions, shows that when a single substance is in solution, external pressure in general promotes solution and increases the osmotic pressure. Where two fluids dissolve into one another and form two saturated solutions the effect of the external pressure in general depends on the relative quantities of the two fluids. Guinchant (Comptes Rendus, Feb. 25) has sought an expression for the variation of the volume of a dissolved body with pressure. Defining the volume of the dissolved body as the difference between the volume of the solution and that of the solvent, the author finds that it is independent of the pressure, at least up to 4 atmospheres. The variation of volume which accompanies the simple solution of a body in water must then be due to a variation in the state of aggregation of the solvent rather than to the volume occupied by the dissolved molecules. F. G. Donnan (Philosophical Magazine, June) explains colloidal solutions by means of Laplace's theory of intermolecular attraction. Any small volume-element in the bounding interface of a solid immersed in a liquid is acted on by two forces, one due to the attraction of the solid, and the other to that of the liquid. For crystalline solids the former is greater than the latter, while for colloidal matter in contact with certain liq-

uids it is assumed that the reverse is the case. The solid will therefore begin to disintegrate into the liquid, but the process stops before true solution sets in, and to account for this the author assumes that the molecular adhesion between the liquid and solid is greater than the molecular cohesion of the colloid, and that for the latter the intermolecular attractive forces fall off more rapidly with increasing distance than for the former. Hence there exists a critical thickness of the colloidal substance such that the forces defined above just balance, and when this state is reached disintegration ceases.

Crystallization.—W. Campbell (London Physical Society Proceedings, 17, pp. 337, 338) finds that pressure may bring about crystallization in solid metals. When a button of slowly cooled tin is hammered it assumes a fine crystalline structure, and a similar crystallization is brought about on the faces of a saw-cut or in filing. A copper-tin alloy containing 1 per cent. of copper gives the same effects as pure tin. The crystallization is only on the surface, as is shown by polishing, when the crystals slowly disappear, giving place to the ordinary structure. G. Tammann (Annalen der Physik, March) throws doubt on the "liquid crystals" whose existence was inferred by Lehmann from the fact that crystals of certain substances, although perfectly clear in the solid state, give rise when melted to turbid liquids that appear bright when viewed between crossed nicols. The author rejects the view that such compounds retain their crystalline structure in the liquid state, and considers the turbid liquids as emulsions of a brown reduction product. He points out that mixtures of powdered glass and water, and other turbid non-crystalline media, give a bright field between crossed nicols. The author's theory does not explain the fact that when such liquids are heated a sudden change in their volume occurs at the point where the turbidity disappears.

Rigidity of Liquids.—T. Schwedoff (International Physical Congress at Paris, Report, 1, 1900) points out that solids show some of the properties commonly ascribed to liquids, and *vice versa*. He discusses the relation between deformation in liquids and internal friction, and arrives at the following results: (1) The viscosity of a liquid depends on its modulus of rigidity, on the limit of its spring, on the speed of relaxation, and on the speed of deformation. (2) The viscosity of a liquid may vary with the speed of deformation. (3) The change in viscosity is more sensible as the limit of elasticity increases. (4) When the rigidity can not be measured directly, the liquid may nevertheless be very viscous, if the speed of relaxation be small. (5) On the other hand, a liquid may present great fluidity and yet have a measurable modulus of rigidity if the speed of relaxation be very great."

Capillarity.—G. van der Mensbrugghe (International Physical Congress at Paris, Report, 1, 1900) concludes from various experimental proofs of the great elasticity of liquids, both under compression and under traction, that liquids can not be regarded practically as incompressible, and that a liquid can not have a uniform density at all points in its substance. He thus believes that superficial tangential tensions must exist in the outer layer of the liquid, and that normal tension must exist, giving rise to evaporation. The author deduces the law that in order that one liquid may spread over the surface of another, it is sufficient and necessary that the mutual action should be greater than the tension of the two surfaces. C. T. Knipp (Physical Review, September, 1900)

has measured the surface tension of water above 100° C. by determining the force required to lift a partly submerged platinum wire. The critical temperature was found to be 374° C., and the pressure 205 atmospheres. The surface tension decreased linearly with increase of temperature until near the critical temperature, when it fell to zero very rapidly. (See also *Electrocapillarity*, under **ELECTRICITY**, below.)

Viscosity.—Hauser (Annalen der Physik, Jan.) has studied the influence of pressure on the viscosity of water up to 500 atmospheres in the temperature range of 15°–100°, using a capillary-tube method. He finds that up to 32° increase of pressure diminishes the viscosity, and that in this temperature region the effect of pressure diminishes with increasing temperature. In the neighborhood of 32°, increase of pressure up to 400 atmospheres has no effect on the viscosity coefficient, while above 32° the viscosity is increased by an increase of pressure of the amount stated.

Sound. Velocity in Hot Air.—E. H. Stevens (German Physical Society) has measured the velocity of sound in hot air by means of a resonance tube of porcelain closed at one end and heated in a coal-stove. The velocity at 950° was found to be 686 meters per second, instead of the theoretical value 701.8. From further experiments with an electrically heated tube, it was found that the divergence between theoretical and actual values increases with the temperature. At 1,000° the actual velocity is 700.3 instead of 716.

"Speaking Flames."—E. Ruhmer (Physikalische Zeitschrift, Feb. 23) finds that flames other than the electric arc will produce sound, relatively weak, under the influence of periodic variations of electric current. If a microphone circuit be connected with the low voltage coil of a transformer, and the current in the secondary coil be led to a Bunsen burner, through the flame, and back through a strip of platinum foil in the flame, the effect is well shown. Higher tones are better transmitted than lower. The author uses with success in reproducing speech loudly with an arc-lamp a transformer with 2½ times as many windings in the secondary as in the primary. With the Bunsen burner, since the resistances are greater, the secondary coil must have a correspondingly greater number of windings.

Mechanical Effect of Sound-Waves.—B. Davis (American Journal of Science, September, 1900) produces by means of stationary sound-waves a continuous rotation of a kind of anemometer wheel in which the cups are replaced by gelatin capsules with flat bottoms, the whole being mounted on a needle-point by means of a glass pivot. The rate of revolution at any point of an organ-pipe is nearly proportional to the velocity of the vibrating air particles at that point. According to Bernoulli, a gas in motion is virtually less dense than a gas at rest. The air in each capsule cylinder is at rest, while that on the outside of it is in motion. The kinetic energy evolved is due to the difference of density on the two sides of the closed end of the cylinder.

Musical Intervals in Melody.—G. Zambiasi (Nuovo Cimento, July) has tested the assertion of Cornu and Mercadier that the scale of stringed instruments in unaccompanied melody is a comma ($\frac{81}{80}$) sharper in the third, sixth, and seventh of the scale than in harmony. After investigation with artists' voices and a phonograph the author finds the acoustic scale, not sharpened by a comma, very closely adhered to, with occasional exceptions in the sixth of the scale; but even then only in cases in which it seems to be felt that the fifth has, for the time,

become a keynote. The acoustic scale is therefore the true scale for melody, as well as harmony.

Transmission through Porous Materials.—F. L. Tufts (American Journal of Science, May) has studied this question by using cylindrical vessels filled with shot of various sizes, from 4.37 down to 1.22 millimeters in diameter. The results indicate the law that the resistance offered by granular material to the to-and-fro motion of a sound-wave is proportional to the thickness of the material, other things being equal. Hence the relation between the resistance and the thickness is the same as holds for direct currents or air.

Heat. Expansion.—Lémeray (Comptes Rendus, Dec. 31, 1900) concludes from experiment that if pieces of different metals have equal volumes at absolute zero, their volumes will again be equal to one another at their respective melting-points. Thus the product of the coefficient of linear expansion by the absolute temperature will be constant. The author gives a diagram which shows that in the case of sixteen metals considered the conclusion is verified with reasonable accuracy.

Radiation.—Thiesen and also Michelson state that for any given wave-length the energy of radiation increases indefinitely with the temperature, or, in other words, that there is no limit to the amplitude of the vibration which gives rise to that particular ray. On the other hand, W. Wien considers that with rising temperature the energy of every wave-length approaches a finite limit. Lummer and Jahnke (Annalen der Physik, October, 1900) endeavor to obtain a general formula from which the two contending formulæ could be deduced by altering the constants. The equation so obtained makes Thiesen's view the only admissible one.

Light. Photometry.—J. Violle, in a paper read at the Paris International Electrical Congress (abstract in The Electrician, Sept. 28, 1900), gives the following account of the various photometric standards:

1. Incandescence standards. (1) The platinum international standard is satisfactory provided the materials used are pure. Petavel prefers the Violle standard. The uncertainty relatively to the intensity of the light emitted by the melted platinum under normal conditions does not exceed 1 per cent.

(2) Lummer and Kurlbaum propose to use incandescent platinum below the temperature of fusion and in such condition that $\frac{1}{10}$ of the energy radiated should be absorbed by a layer of water 2 centimeters thick; but a serious objection is that this temperature is too low and the light emitted is too red.

(3) The crater of the positive carbon in the electric arc may be taken as a standard, but a difficulty arises from the fact that when the arc hisses the most brilliant part is displaced.

(4) Incandescence lamps have been introduced as intermediate standards in photometry. In order that the luminous intensity may be constant, very precise regulation of the potential at the terminals is necessary.

II. Flame standards. (1) The Hefner standard, which uses amyl acetate and requires very careful regulation of the height of the flame, is the legal standard in Germany. Its intensity is greater in winter than in summer owing to the presence of water vapor, and the red tint of the flame and its feeble luminous intensity are grave faults.

(2) The pentane standard excels the Hefner lamp in having a more vigorous flame, but requires more attentive regulation. The influence

of humidity is the same as in the Hefner lamp, and it is also affected by pressure.

(3) In the apparatus of Dibdin the air is carburetted by passing over pentane in a reservoir, which forms the base of the apparatus. The proportion of air and of pentane depends on the temperature of the room, and the degree of humidity must also have a great influence. The Methven standard, on the other hand, has a diaphragmed flame, carburetted with pentane and fed by ordinary illuminating gas, and gives better results.

(4) Among various flame standards lately proposed, but not yet adopted in practice, are many acetylene standards. The light from acetylene differs little from that given out by melted platinum.

A bolometric study by Clayton, Sharp, and Turnbull has revealed unexpectedly large variations in the total emission of the different standards. In the English candle the variations may attain 46.5 per cent. of the mean intensity; the maximum variation for the German candle is 24 per cent. The variations of the Hefner standard may reach 22.6 per cent., but they may be reduced to 2 per cent. by careful regulation. The Carcel lamp may have extreme variations of 18.2 per cent., but the changes are slow and the variation may remain for thirty-five minutes inferior to 0.8 per cent. The authors conclude that the Carcel lamp is the most constant of the standards they have examined.

Constitution of White Light.—O. M. Corbino (Comptes Rendus, Aug. 26), after stating Gouy's opinion that the constituents of the spectrum of white light are components of a single complex vibration, and are capable of mutual interference, and that of Carvallo, who regards the separate radiations as completely independent, and therefore incapable of interference, asserts that the latter view is supported by spectroscopic observation of beats produced by two pencils of white light, one of which is slightly altered in period.

Velocity.—Perrotin (Comptes Rendus, Nov. 5, 1900) describes experiments made at the Observatory of Nice to determine anew the velocity of light. The method adopted is that of the toothed wheel of Fizeau as modified by Cornu. In preliminary observations between two stations nearly 12 kilometers apart the value found is 299.90 ± 0.08 for the velocity *in vacuo* expressed in thousands of kilometers. About 1,500 measurements were taken during more than a year, making use only of absolutely still images, and taking observations without precipitation so as to attenuate or eliminate systematic errors, especially physiological ones. The source of light was the filament of an electric lamp of 16 candle-power.

The "Gray-Glow."—O. Lummer criticizes the law of Draper that all bodies begin to emit light at the same temperature. According to the more recent researches the first sensation of light as the temperature of a body is gradually raised in a dark room is the "gray-glow," now known to be due to the rods in the retina, but this can scarcely be called emission of light, since the human eye can not then bring the body to a focus, the attempt only serving to make the body invisible again. The first real sensation of light takes place at a much higher temperature, which varies with the body emitting it, so that here Draper's law does not apply. Whether it applies to the "gray-glow" is very doubtful. The author has observed the gray-glow as low as 360°C .

Absorption.—Koenigsberger (Annalen der Physik, April) has experimentally determined the influence of temperature on the absorption of light by various solids, and finds that in solids having

selective absorption a rise of temperature moves the absorption curve toward the longer wavelengths, and sometimes also increases the width of the absorption band without sensibly altering the magnitude of the maximum absorption. In metals the absorption is not influenced by temperature within the limits 10° – 360° . Platinum shows no influence up to 800° . The author shows that these experiments explain the influence of temperature on the refractive index and the dispersion on the assumption that the dielectric constant always diminishes with increase of temperature.

Refraction.—F. Pockels (*Physikalische Zeitschrift*, Aug. 31) has investigated this problem experimentally and finds that in polarized light the component polarized perpendicular to the direction of the pressure is retarded relatively to that parallel to the pressure, and, contrary to the usual result, the glass becomes positively double refracting.

Interference.—C. Barus (*Science*, 12, 1900) notes that the interferences observed on viewing one grating or piece of gauze through another are very complex. If two gratings are placed at a distance apart along an axis, and the first illuminated by a strong diffuse light, the second will project a real image of the former grating at definite points on the axis. When these images are looked at by the eye in the proper position, they appear as magnifications of the first grating, often enormously large, the size increasing with the distance of the focal plane from the projecting grating. The indefiniteness of focus when viewed by the normal eye is due to its power of accommodation, and the size is an illusion, for the eye is adjusted for an infinite distance and locates the image of unknown position there.

Magneto-optics.—H. A. Lorentz (*International Physical Congress at Paris*, Report, 3, 1900), in a discussion of the various theories of the influence of a magnetic field on the emission of light, shows how, if a radiating molecule is a material system of a certain number of degrees of freedom, there results a spectral ray which splits up under the action of a magnetic field into a number of components corresponding to the frequencies that are equal apart from that magnetic field.

Spectroscopy.—N. E. Dorsey (*Astrophysical Journal*, September, 1900) has made observations to determine whether in the refraction of light the medium requires time to reach a steady state—that is, whether a short train of waves is refracted in the same way as a long train of the same period. If the initial disturbance is refracted differently from a continuous one, then the lines as seen in a prism instrument should be broadened or rendered hazy on one or both sides as compared with the same lines in the grating spectroscope, but no such effect could be observed either with a continuous source of light or an electric spark. Haschek (*Sitzungsberichte of the Vienna Academy*, January–March), in an investigation of a possible connection between the wave-lengths of spectral lines and the mode of production of the incandescent vapor used to produce them, finds that displacements of lines in the arc and spark spectra are common, and, under certain circumstances, reach considerable magnitudes, but that the wave-lengths depend in a high degree on the momentary conditions of the experiment, and these can not always be controlled. The wave-lengths of the lines are to a great extent dependent upon the consumption of energy, and as this is greater with the transformer, some lines are strongly displaced toward

the red. (See also Kerkhoff's experiments under **ELECTRICITY**, *Gases*, below.)

Telescopy.—J. Renton (*Nature*, Aug. 2) discusses a hitherto unexplained anomaly in comparing the zenith distance of a star by direct observation with that obtained by reflection in a pool of mercury. He attributes the difference of temperature in the stagnation in the telescope tube. The upper side of the tube is cooled by radiation, while the lower is protected, causing a transverse gradient of temperature in the air inside. The rays passing through the tube will thus be bent upward. The error is important because it affects the zenith distances of polar stars, and hence the deduced results for latitude. The writer recommends that means should be used for circulating the air in the tube.

Phosphorescence, Radio-activity, etc. (See also **Röntgen Rays** under **ELECTRICITY**.)—The subject is reviewed in the *Revue Scientifique*, Sept. 8–15, 1900, by Gustav le Bon. He asserts that most bodies under the influence of light become radioactive, emitting effluvia or Becquerel rays. He admits no real distinction between fluorescence and evanescent phosphorescence. The spectrum from blue to ultra-violet excites phosphorescence; from green down to infra-red it tends to extinguish it; in an intervening portion it excites up to a certain intensity and reduces all above that intensity. The temperature at which phosphorescence begins is always far below incandescence, and phosphorescence is a "cold" light, but too weak for practical use. This weakness is not the cause of the apparently low temperature; we do not know anything about the infra-red region of the phosphorescence spectrum. Phosphorescence too faint to be seen may continue for eighteen or more months without any heating. Even when invisible phosphorescence has died out, certain dark radiations may reexcite phosphorescence up to the point of visibility. There is, therefore, some "residue" permanently left in the body, as the result of the momentary exposure to light; but this can be dissipated by heat. It is the impact of the particular dark waves, not the heat evolved, that produces the temporarily revivifying effect and the partial or complete exhaustion of the residue. The "heat-waves" are not necessarily infra-red; they may be so when the source is at a low temperature; but when the compression of the whole infra-red into a small space in the ordinary spectrum is taken into account, the maximum heating power in sunlight is found to be near line D. The "residue" mentioned above does not seem to be stored luminous energy, but may consist of decomposition products that unite when the temperature favors combination. Minerals cut in the dark from the interior of very large lumps, and which have therefore not seen the light for ages, shine upon being heated as well as if they had recently been exposed to light. They appear to contain the products of decomposition referred to. The "residue" when stimulated into activity, say by a temperature of 100° , becomes exhausted if this temperature is kept up, but then a temperature of 200° will bring a fresh portion into play, and so on up to say 500° or 600° . Heating to 100° for months will not bring out that portion of the residue which comes into activity only above 100° , and so forth. A body incompletely exhausted at 500° and then cooled down and reheated to 200° will not shine, for all that portion of the residue is exhausted. Phosphorescence by shocks or blows appears not to be due to localized high temperature, but to a conversion of energy similar to an explosion. Phosphorescence under Röntgen

rays is very feeble, while fluorescence is bright. Phosphorescence accompanies oxidation, hydration, and dehydration. In living beings there is probably hydration and dehydration. In radioactive bodies phosphorescence is readily lost by hydration and by heat, which points to chemical reactions rather than to atomic properties as the cause. Perfectly pure substances are not phosphorescent; traces of other substances are necessary. Sulphide of strontium, for example, needs one part per 10,000 of a salt of manganese or bismuth. Phosphorescence of living beings is practically universal in deep-sea life. The phenomenon survives the life of the animal, but deprivation of air and moisture stops it. It is apparently due to chemical reactions. Fluorescence is explicable on principles of resonance, but protracted phosphorescence, visible and invisible, seems hardly so. It seems to be due to chemical reactions going on even within the solid, and yet extremely mobile, so that they can be set up or arrested in fractions of a second, and reversible, but also dependent upon the temperature, so that the combination is promptly broken up by a very high temperature, slowly by a lower, and not at all at a sufficiently low, temperature. This points toward a new field in chemistry. H. Becquerel (Comptes Rendus, July 22), in observations on uranium radiation at very low temperatures, finds no alteration in the amount of radiation emitted, even at the temperature of liquid air. The writer has verified Dewar's experiment, in which, when a crystal of nitrate of uranium is plunged in liquid air, it becomes luminous spontaneously, and believes that Prof. Dewar is correct in attributing this to electrical action provoked by a molecular contraction. Rutherford and McClung (Philosophical Transactions, Feb. 27), in a discussion of the energy of Becquerel rays, note that radium and polonium vary very much from sample to sample, both in intensity and in kind of radiation, while uranium seems constant. Probably the radio-activity of uranium is possessed by the whole mass of the substance. In ten million years each gramme of uranium in pitchblende must have radiated at least 300,000 calories, and radium far more. To consider these substances as transformers of energy leads to many difficulties. Possibly the regrouping of the components of a molecule might explain the supply of energy, but hardly in the case of radium, should it prove to be persistent in its radio-activity.

Electricity. *Electrification.*—W. C. Henderson (Philosophical Magazine, 50, November, 1900) describes experiments to determine whether a liquid when electrified loses any of its charge by evaporation. The loss of charge from an insulated vessel was found to be the same whether the vessel was empty or contained a liquid. Experiments were made with cool water, hot water, and ether, and in each case the result showed no loss of charge by evaporation. These results are in opposition to the recently published observations of Pellat.

Conduction.—E. Grüneisen (Annalen der Physik, September, 1900) finds that the addition of foreign substances reduces electric conductivity to a greater extent than it does thermal conductivity. This is specially evident in iron. F. Streintz (Annalen der Physik, September, 1900) has made some experiments on powdered conductors which indicate something like a transition from metallic to electrolytic conduction. He prepared fine powders of platinum black, graphite, and lampblack, and subjected them to considerable pressure in a hole bored in a block of ebonite. Judged by the temperature coefficient of the re-

sistance, lampblack thus prepared is equivalent to a dilute solution of sulfuric acid, while graphite ranges itself among the metals. V. Crémieu (Comptes Rendus, May 6) follows up his experiments showing that electric convection produces no magnetic effect by an attempt to show that "open currents" exist, as they must if his earlier experiments are correct. (See *Convection*, below.)

Resistance.—H. Chevallier (Comptes Rendus, Dec. 24, 1900), who has previously determined the permanent changes produced in platinum-silver wire under the influence of temperature, especially the change in its electrical resistance, has conducted experiments which show that oscillating temperatures produce a greater change in the resistance than steady temperatures. The author concludes that the permanent modifications in the body itself are mostly due to small oscillations of temperature. J. Patterson (Cambridge Philosophical Society, April 22) has investigated further the facts, discovered by Longden, that the resistance of thin metallic films, deposited on glass by the cathode discharge, is much greater than that calculated from the ordinary specific resistance of the metal. The author tries the effect of a magnetic field upon the resistance of such films, and finds that for bismuth the change of resistance in the field is a small increase, but very much smaller than that for the same metal in the form of wire. The change of resistance decreases with decrease in the thickness of the film.

Coherence.—T. Mizuno (Philosophical Magazine, November, 1900) states that the results of experiment tend to show that the action of the coherer depends in some way on the microscopic sparks produced in fine metallic particles by electric waves, giving rise to a "welding" action that forms conducting chains of particles and lessens resistance. From a series of experiments on metals, alloys, and their mixtures, the author draws the following conclusions: (1) In platinum, lead, nickel, aluminum, cadmium, copper, steel, silver, and potassium coherers the action of electric waves is to reduce resistance at first largely and then irregularly, and the resistance finally assumes a fixed value. (2) With iron, tin, bismuth, zinc, and antimony coherers, the resistances are diminished at first, but soon afterward the changes become very irregular. (3) With one and also two small lead-ball coherers the resistance attains its final value very rapidly. (4) In the alloys the general tendency is to the reduction of resistance to limiting values, with more or less irregularity. (5) With coherers formed of mixed metals, the change of resistance seems to be chiefly governed by the percentage ratios of the constituents. (6) With zinc, lead, potassium, and electric fuse, the resistance suddenly assumes infinite value at a certain stage during the experiment. The results appear to support the view that the action may be due to something like welding. The lower the melting-point the greater is the reduction of resistance. G. Ferrié (Éclair Électrique, Sept. 29, 1900) has experimented with coherers of carbon-carbon, carbon-metal, metal-metal, metal-liquid, in air, oil, and vacuum respectively. The results with metals were always better than with carbon. In general, the most effective coherer has a resistance of 1,000 to 25,000 ohms, and works with a current less than a milliampere. If the initial resistance is too high, the effects are feeble and generally disappear; if too low, the effects at first may be striking, but they may suddenly cease. If the initial resistance is infinite, the action is irregular; the strong impulse necessary for coherence will probably

cause persistent contact. Zinc and its alloys give the greatest sensitiveness, but nickel and platinum the most regular results. The degree of oxidation has great influence on the sensitiveness. P. E. Shaw (Philosophical Magazine, March) has added by his experiments to our knowledge of the nature of coherence due to the incidence of electromagnetic waves. Among his conclusions are the following: (1) The insulating layer between the surfaces of the contact is of importance before the first coherence has occurred. (2) In certain cases there actually is a bridge of metal formed between the surfaces and rigidly connected to both. (3) A peculiar molecular change (called orientation) has been brought to light. After coherence has taken place and the current has passed through the coherer in one direction, suppose decoherence to be brought about so that no current now passes; if then the direction of the electromotive force in the coherer circuit be reversed, coherence immediately occurs.

Electric Waves.—G. Pierce (Philosophical Magazine, May), with reference to previous measurements of refractive indices for electric waves of several doubly refractive media (woods) which were also doubly absorptive, has investigated the question whether the double absorption is sufficient to account for the double refraction, and whether both these properties can be ascribed to differences of conductivity along and across the grain. Mathematical analysis shows that in that orientation of electric force in which absorption is greatest, velocity is least, and therefore index of refraction greatest. This agrees with the results of the experiments on woods. In all the specimens tested, both index and absorption were found to be greater when the grain was parallel to the electric displacement than when it was perpendicular. The author concludes that heterogeneous conductivity plays an important part in the phenomenon. T. Tommasina (Comptes Rendus, Nov. 26, 1900) has used improved carbon coherers as electroradiophones to detect distant thunder-storms. The electrodes are lamp carbons joined to platinum wires and the coherer is sealed to exclude moisture. Three copper antennæ, each 30 meters long, were fixed to insulators at a height of 12 meters, and one end of each was connected to earth. To avoid danger, the antennæ were not vertical, and were disconnected and insulated on the approach of a thunder-storm. J. D. van der Waals, Jr. (Physikalische Zeitschrift, May 4), seeks to explain radiation phenomena by a statical theory. He applies the probability law to an aggregate of radiating molecules. If in an element of space there is an aggregate of molecules radiating to an external point, P , the electric moments of the molecules are as probably in one direction as in the opposite, but, for radiation to reach P , deviations must occur from the most probable distribution of the moments of the molecules; these and the electromagnetic force at P vary as the square root of the number of the molecules. This deduction is based on the assumption that the vibrations are independent of one another, but because of absorption a partial arrangement must exist in the molecular vibrations. The law of this arrangement is yet to be discovered; it involves attractive forces between the molecules, and the author suggests the possibility of thus explaining molecular attraction.

Electrolytic Phenomena.—R. R. Ramsey (Physical Review, July, 1901) has succeeded in measuring the very small electromotive force set up between two metallic electrodes at different heights in an electrolytic solution, owing to the

difference in weight of the ions and their different migration velocities. A tube containing two electrodes of zinc or cadmium electrolyte was filled with zinc or cadmium sulfate and connected in series with a sensitive galvanometer. By turning the tube from a horizontal to a vertical position a deflection of the galvanometer was observed. In the case of zinc electrodes in 10 per cent. zinc sulfate solution the calculated electromotive force was 2.4×10^{-8} volts per centimeter of height between the electrodes. The mean of the last five observations was 3.1×10^{-8} volts. Similar results were obtained with cadmium electrodes in a solution of cadmium sulfate. B. D. Steele (Journal of the Chemical Society, April) has devised a modification of Lodge's method for the measurement of ionic velocity in which the velocity is measured directly by means of the movement of the boundary between a colorless and two colored salts in a gelatinized electrolyte during the passage of a current. The author largely avoids the use of gelatin by employing vertical tubes, and finds it possible under certain conditions to observe the boundary between colorless solutions by means of slight differences in density and refractive power, so that the use of a colored solution is also rendered unnecessary. Riesenfeld (Zeitschrift für Elektrochemie, May 23) shows theoretically that at the interface between solutions of the same electrolyte in two partially miscible solvents concentration will increase at one junction and decrease at the other (supposing the two solutions to be contained in a U-tube), and that this variation will be proportional to the difference between the migration constants of the cation (or anion) in the two solvents.

Phenomena in Rarefied Gases.—W. Kaufmann (German Physical Society) bases an explanation of the negative glow-light and the dark cathode space upon the fact that cathode rays dissociate the gas through which they pass, and render it conducting. As this conductivity disappears rapidly after the discharge ceases, the ions must combine again of themselves, and the author supposes that the negative glow-light arises through the impact of ions during this combination. E. Goldstein (ibid.) adheres to his previously expressed views that the glow-light consists of rectilinear rays that spring not from the cathode itself, but from the ordinary cathode rays, from all parts and in all directions. Owing to the repulsion exerted by the cathode there is formed around it a space free from glow rays—the so-called dark cathode space. Further applications of the principle explain the extension of the dark space when the pressure diminishes; also its restriction by placing another cathode opposite, or by the action of a magnet. J. Stark (Annalen der Physik, October, 1900) finds that under the influence of heat the luminous layers in a vacuum discharge show a decrease of potential gradient and an increase of current intensity. The changes occur first slowly with increasing temperature, then rapidly, and then again slowly. The dark spaces show an opposite behavior. At a red heat the bright layers become dark and acquire the properties of the latter. K. Kerkhof (Annalen der Physik, February) has shown that the temperatures of gases in Geissler tubes of different diameters are not inversely proportional to the cross-sections, as has been supposed. Probably during the discharge heat is given off to the glass and to the surrounding atmosphere. To test the general opinion that the change of the band spectrum to the line spectrum produced by using a spark gap is due to a rise in temperature, the author inserted a spark gap, and found that this

always gave increased temperatures, provided the gap was large. Small spark gaps lowered the temperature, the probable explanation being that while they do not alter the course of the discharge, a part of the energy is lost in the form of heat. The author also finds that when a discharge takes place in a Geissler tube the introduction of a special coil causes a rise of temperature at the positive end and a lowering of temperature in the neighborhood of the cathode. H. Ebert (*Archives des Sciences*, August) has measured the number of free ions in the atmosphere by drawing air through a tube connected with an electrometer and screened by a larger concentric tube. The electrometer remained charged for several days after stopping the air current. The number of free ions in the air seems to increase with the purity and transparency of the air and the intensity of the solar radiation; both the number of free ions and their velocity of discharge vary considerably.

Röntgen Rays.—L. Benoist (*Comptes Rendus*, Feb. 11) finds that (1) the specific opacity of a body for Röntgen rays is independent of its physical state. (2) The opacity is independent of the mode of atomic grouping—e. g., of crystalline form, allotropic state, etc. (3) It is independent of the state of liberty or combination of the atoms. (4) In simple bodies, measured under well-defined conditions, it is a definite function of their atomic weight and increases with the latter. In the same publication (March 4) he shows that transparency for Röntgen rays depends on atomic weight in a large number of elements, and he even (*ibid.*, March 25) infers the atomic weight of an element from its transparency to the rays. Hébert and Reynaud (*ibid.*, Feb. 18) find that the absorption of the rays by saline solutions is proportional to the atomic weight of the metal in the salt. Sagnac (*Annales de Chimie et de Physique*, March) concludes that Röntgen rays travel in straight lines, subject to scattering which bears no relation to the diffusion or reflexion of light on the surface of the body traversed. The peculiarities in the rectilinear propagation of the rays are only apparent, and the course of the rays is the same as that of light rays. At the same time there is no diffraction, refraction, reflection, or regular polarization. All this is brought into harmony by the theory of Stokes and J. J. Thomson, with the additional observation that, with ordinary light, refraction would be impossible if the wave-lengths were less than twice the distance between the particles of the prism. It is also impossible where the train of disturbance of the ether produced by molecule impacts (Stokes) dies out in less than twice the same distance. This result is the same for transverse and longitudinal ether disturbance. W. Rollins (*American Journal of Science*, November, 1900), in a discussion of current opinions, holds that strained ether is necessary for the production of cathode rays, and that the cathode stream is due to gas amalgamated with the cathode and stops when this is exhausted. He asserts that the theory of indivisible atoms is not now admissible, nor is the idea that the particles in the cathode stream are ultimate components, for their spectrum is too familiar, too complex, and not new. The author holds that Röntgen rays are short ether waves due to impact and heating of the impinging particles, which become radiant centers and thus cool down. The transparency of aluminum to Röntgen radiation is explained on the theory that aluminum atoms and cathode-stream subatoms are made up of ultimate atoms proportional in number to the atomic

weight, and themselves identical for all elements, and that there is ether between these. A platinum target faced with aluminum is not an efficient reflector of Röntgen rays, and the author thinks that the aluminum atom is a more open structure than a platinum atom. C. H. Wind (*Physikalische Zeitschrift*, Feb. 9) describes experiments that he considers to be the only ones which have given a positive proof of the diffraction of Röntgen rays. This proof he gives by using a microscopic wedge-shaped slit and observing the widening of the image near the apex. A diagram given shows two bulbous enlargements, one much smaller than the other, the latter being nearer the apex. G. Sagnac (*Annales de Chimie et de Physique*, June) discusses the mechanism of discharge by Röntgen rays, taking secondary and tertiary radiations through the field into account. The result depends upon the thickness of the metal, the volume of air, the nature of the metal, the nature and the pressure of the gas, the strength of the electric field, and the form and area of the metallic surface. The differences due to the nature of the metal may be due to differences in the secondary radiations from the metals, which make the air more conductive. While the bolometric energy of the secondary rays may be much less than that of the Röntgen rays exciting them, the activity of the former may enable us to detect otherwise unperceivable Röntgen rays. The ultra-violet rays studied up to 1900 only dissipated negative charges, and had no effect upon gases, while secondary as well as Röntgen rays affect gases directly. Some peculiarities of the action of Röntgen and secondary rays are readily explained by means of the velocities and energy of the electric charges, liberated by the rays, under the influence of the electric field; and in certain cases these may present analogies to cathodic phenomena. A. Nodon (*Comptes Rendus*, March 25) shows that Röntgen rays may be produced directly in air, and outside the Crookes vacuum, under the simultaneous action of ultra-violet rays and of an electric field. The rays are propagated along the lines of electric force, and are not emitted in other directions. They are more active when the direction of the force lines is that of the propagation of the ultra-violet radiation. The activity of the rays is a function (1) of the intensity of the electric field; (2) of the intensity of the ultra-violet radiation; (3) of the wave-length of the latter; (4) of the nature of the substances at whose surface they originate. The general properties of the rays thus produced are identical with those generated in the usual way by means of Crookes tubes.

Electric Convection.—Lippmann, by applying the principle of the conservation of energy to the experiments of Rowland upon electric convection, showed that, according to his view, changes of magnetic induction ought to produce movements of electrified bodies in the magnetic field. Crémieu (*Comptes Rendus*, Oct. 8, 1900) describes researches made with a pivoted aluminum disk, separated into two parts by mica, and free to turn in its own plane in a magnetic field. As this apparatus did not move perceptibly the author concludes that there is no displacement of a charged body due to magnetic influences. This investigator's failure to verify Rowland's classic experiment showing the magnetic effect of electric convection has caused much discussion. H. A. Wilson (*Philosophical Magazine*, July) maintains that it is to be attributed rather to the methods employed than to the non-existence of the effect. H. Pender (*ibid.*, August) has suc-

ceeded in observing the effect described by Rowland, using the same method employed in Crémieu's first experiment, having avoided certain things that, according to him, vitiated Crémieu's results. Crémieu, however (*ibid.*, August), asserts the validity of his investigation and abides by his results as announced.

Photoelectricity.—J. Zeleny (Physical Review, June) has experimented on the influence of the temperature of a body upon the rate at which electricity is discharged from its surface by ultra-violet light. From a platinum wire the negative electricity is at first discharged more slowly as the temperature is increased; but the rate of discharge reaches a minimum and then increases as far as the highest temperature used (about 700° C.). The rate also depends upon the previous history of the wire, being much greater after the wire has just fallen in temperature than when it has just risen. An iron wire also descends at first to a minimum rate of discharge, but the final value is many times that for ordinary room temperature. Heating the wire does not change the inability of ultra-violet light to discharge positive electricity, even though the wire is raised to a temperature where the positive electricity is being discharged on account of the heat alone. The author concludes that the variations observed are mostly due to changes at the metal surface, and not in the gas between the electrodes.

Electrocapillarity.—S. Lemström (Annalen der Physik, July) describes experiments on the behavior of liquids in capillary tubes under the influence of an electric discharge. He finds that under the influence of an electric current passing through a stratum of air, water rises along the sides of the tube, and forms drops in the upper end; but this phenomenon takes place only when the metal point from which the discharge passes to the tube is connected with the negative pole of the machine.

The writer believes that the phenomena described may be related to the influence of electricity on plants.

Hysteresis.—Krogh and Rikli (Elektrotechnische Zeitschrift, Dec. 27, 1900) have investigated the effect of wave-form on loss by hysteresis, and find that for a given maximum induction, a peaked electromotive force wave (and therefore a flat-topped induction wave) corresponds to a higher hysteresis loss. They remark that the result might have been anticipated, since with a flat-topped induction wave the changes in the induction are more rapid—except, of course, near the maximum points.

Electric Inertia.—A. Schuster (Philosophical Magazine, February) notes that in the immediate neighborhood of an ion the magnetic field will be many times greater than that calculated on the supposition of continuous distribution, and hence the total magnetic energy is underestimated, and the flow of electricity will behave as if it had inertia. In calculating the chances of verifying this inertia experimentally, the author finds that the effect would be much smaller than the extreme limits of Hertz's experiments on electric inertia. In metals, therefore, no results need be looked for, but in a bad conductor, like carbon, we might get within the limits to which Hertz worked. In the case of liquids and gases, the chances of experimental verification of inertia are equally remote, but a clear proof of such inertia may be looked for in the domain of luminous vibrations.

Motion of an Electrified Particle.—E. Riecke (Physikalische Zeitschrift, Jan. 5) has investigated the motion of an electrified particle of ion

in a uniform magnetic field upon which a uniform electric field is superimposed. The author's analysis shows that the particle moves along a cycloidal curve, whose axis is a parabola. The generating curve is not a circle but an ellipse, and the arcs of the cycloid expand during the motion. These results bear upon the cathode phenomena, the changes in luminous layers under magnetic influence, and the theory of the aurora.

The Wehnelt Interrupter.—Lampa (Sitzungsberichte of the Vienna Academy of Sciences, 109, IIa) has sought to find the reason why a Wehnelt interrupter is less efficient when the smaller electrode is negative. Using a coherer circuit containing a galvanometer, the author finds that the effect upon the coherer under continued sparking at the interrupter is very pronounced when the smaller electrode is negative, but very small when it is positive. The effect is apparently greatest when the interrupter is working quietly, and least when it is working violently. Variation of the length of the smaller electrode showed that the effect is in a measure a periodic function of this length. The phenomenon seems to be a resonance effect, depending upon the resistance, self-induction, and electrolytic capacity of the circuit at the moment of interruption. It is to be noted also that the resistance is smaller when the small electrode is positive than when it is negative. A rotating mirror shows that the spark is of shorter duration when the small electrode is positive than when it is negative.

Instruments for Electric Measurement.—M. Alliamet (Bulletin of the International Electrical Society, July–August and September–October, 1900, reported in Science Abstracts) describes new forms of instruments shown at the Paris Exposition, as follows:

Galvanometers.—In the Broca astatic galvanometer there are two vertical needles, each with a consequent pole at its center and of opposite polarity. The system is astatic, even when the needles have different strengths. One pair of bobbins is fixed with its axis at the height of the consequent poles, the end poles being outside the bobbins. A ballistic d'Arsonval galvanometer has a moving coil, of 500 ohms resistance, very long in a horizontal direction so as to increase the moment of inertia. The suspension consists of three metallic wires attached to the galvanometer in a plane containing its center of gravity. To avoid swinging, vanes dipping in oil are attached to the bottom. A registering d'Arsonval galvanometer has six horizontal circular magnets, and the moving coil carries a flexible arm with a pen which is pressed against the registering drum by an electromagnet. A portable mirror galvanometer carries on one tripod a scale and telescope supported on an arm that is jointed in the middle of its length. In Callendar's registering galvanometer a deflection closes one of two relay circuits and releases a clockwork mechanism, which moves a carriage with registering pen along the slide wire of a Wheatstone bridge until balance is obtained.

Ammeters and Voltmeters.—The Caron alternate-current ammeter consists of a pair of horseshoe electromagnets acting on a flat, oblong coil which is pivoted at one end. The current which is introduced through a transformer, with a single turn in the primary and a high resistance secondary, causes the coil to move in its own plane from one magnet toward the other. The voltmeter is exactly similar, except that the magnets are wound with German silver to diminish the effect of their self-induction. Siemens and Halske showed a rotary field ammeter, constructed on the

lines of a four-pole induction motor, with an aluminum drum as rotor. The current passes through one pair of field coils, while the other pair are short-circuited on themselves. Horn constructs an electromagnetic voltmeter with two scales, one in black for continuous currents, the other in red for alternate currents. Two short cylinders of sheet iron are supported eccentrically in a solenoid, one on each side of the axis and at each end of the solenoid. Their motion, under the influence of the field in the solenoid, tends to place them coaxial with the solenoid, and it is transmitted to the needle by a jointed frame. A novel exhibit is Arnö's electrostatic voltmeter, based on the principle that a dielectric in a rotary electrostatic field tends to rotate with the field by reason of the lag in its polarization. Three segments of a metal cylinder, connected to a three-phase supply, surround a paraffined paper cylinder whose rotation is controlled by a spiral spring.

Resistances.—Constantan is employed in the construction of some recent resistances, and to avoid the effect of this alloy's high thermoelectric power the terminals, slides, and all fittings are also of constantan. In high resistances made by Kundt's process, a spiral line is painted on a porcelain tube with a mixture of gold and platinum chloride in camomile oil. This spiral is reduced to the metallic state by burning in a muffle, and then possesses a very high resistance.

Potentiometer.—A portable potentiometer was shown, having a slide-wire contact adjustable relatively to its index, so as to compensate for the temperature variation of the standard cell.

Ohmmeters.—Several direct-reading instruments with one fixed and one moving coil were shown. Another ohmmeter had two fixed coils acting on a soft-iron needle, to which was attached a pointer prevented from oscillating by a fork. The fork can be moved by a milled head to the position of equilibrium.

Earth Detectors.—In an electrostatic voltmeter for indicating the insulation of live conductors, the two conductors of a line are connected to the two pairs of quadrants, while the other needle is connected to earth. If the insulation of one conductor diminishes, the needle deflects toward the other quadrants.

Condensers.—Standard condensers are now sometimes made of sheets of mica silvered by chemical deposition. A condenser having a very small residual charge is made of chemically pure paper impregnated with an insulating material, the nature of which is kept secret.

Wattmeters.—With few exceptions, those exhibited were of the electrodynamic type. Siemens and Halske make non-inductive resistances for connecting in series with the pressure coil of their wattmeters by winding flat wires on thin sheets of mica, fixed side by side in a box about 7 millimeters apart.

Phasemeters.—In the Siemens type two coils, at right angles, carry the two currents, and produce a rotary field whose amplitude varies with the difference of phase between the currents. This amplitude is measured by the rotation of a metallic disk, embraced by the coils, and controlled by a spring. In Arnö's phasemeter an electrodynamic meter with torsion head has two coils that carry the two currents, and inside them is suspended a pair of coils perpendicular to each other and short-circuited on themselves. This system is also provided with a torsion head. From the readings of the two torsion heads may be calculated the tangent of the angle of phase difference.

Curve Tracer for Alternate Currents.—Abraham's rheograph has a galvanometer coil of very long period. In order that the force acting on the coil may be at all times proportional to the current this is transformed by two pairs of flat coils, one within the other, and relatively adjustable in plane. The fourth coil is in series with the galvanometer coil and with an adjustable resistance in the main circuit of the first coil, and also receives an induced electromotive force impressed by the first coil, and adjusted by varying the relative inclinations of the planes of the coils. These adjustments are made till the galvanometer correctly registers the curve of an interrupted continuous current.

Permeameters.—Carpentier's permeameter consists of a massive iron ring with two air-gaps diametrically opposite. In one is suspended a magnetized needle with torsion head and scale. The test-rod, surrounded by a magnetizing coil, is fixed across the ring on a diameter perpendicular to that on which are the air-gaps; the induction in the test-rod is then proportional to the torsion required to bring the needle to zero. The effects of hysteresis are eliminated by a double reading. A complete apparatus for measuring permeability by means of a bismuth spiral contains an iron yoke to take the test-pieces, an ammeter, and a slide-wire resistance bridge to measure the variations in resistance of the spiral. A permeameter designed by Kath consists of a d'Arsonval galvanometer, an iron yoke with magnetizing coil replacing the usual permanent magnet. The test-rod completes the magnetic circuit of the yoke and carries the coil. A constant current is passed through the moving coil, the index of which moves over an arbitrary scale.

Magnetism. Magnetization.—I. Klemenčič (Sitzungsberichte of the Vienna Academy of Sciences, 109 IIa, p. 827) discusses the decrease of magnetic moment with time, and assigns the loss chiefly to two causes. The after-effects of magnetization are responsible for the greatest loss, occurring in the first two days after magnetization. The other cause, which acts more slowly, is the change in molecular structure brought about by previous deformations, and especially by former temperature changes such as those by which the steel is hardened. The greatest loss of moment takes place in summer, little or none occurring in winter. K. Krüse (Sitzungsberichte of the Vienna Academy, January-March, 1900) has subjected bar magnets to violent treatment, and measured the resulting change of magnetic moment. It is found that the greatest decrease is after the first fall, and that the moment seldom remains unchanged after frequent falls from the same height, the total decrease varying between 1.6 and 25.6 per cent. When the magnets are pulled from contact with a soft iron bar the moment increases slightly after the first separation, changing to a decrease after ten separations. Drawing a magnet from a soft iron plate sometimes diminishes its moment 28 per cent.

Residual Magnetism.—P. Holitscher (Annalen der Physik, December, 1900), in experiments on an ellipsoid of Jura iron, by magnetometric measurement, finds that the residual magnetic moment reaches a maximum only after magnetizing for a certain time. Repeated magnetizations, if in one direction only, give continually increasing residual moments up to 100 magnetizations, beyond which the author did not go. If the successive magnetizations are alternately in each direction, the maximum residual moment is acquired after the first or second, and is about 12 per cent. lower than that when the iron is magnetized in

one direction only. The magnetic moment due to the magnetization is affected neither by duration nor number of magnetizations. With sudden removal of the magnetizing force, the residual moment is somewhat smaller than with gradual removal, or removal by steps of not more than 3 per cent.; but a sudden and a gradual magnetization has the same effect. Contrary to the generally accepted results, the author finds that a small value of H , amounting to 0.055, produces a residual magnetic moment equal to 6 per cent. of the temporary moment. The author explains his results according to the theory that assumes the existence of frictional or cohesion forces between the molecular magnets.

Detection of Ancient Magnetic Fields.—Brunhes and David (*Comptes Rendus*, July 15) have applied Folgeraiter's idea that the direction of the magnetic field during the baking of bricks may be ascertained by measuring their permanent magnetism to the beds of clay in the Puy-de-Dôme region which have been baked by lava-streams. Small cubes of the baked clay were cut out, and the directions of their permanent magnetization were determined. In the case of cubes taken from the same lava-stream the results agree fairly well; cubes taken, however, from different lava-streams give widely divergent results, and the authors suggest that the method might be of use in determining whether two lava-streams were contemporaneous or not.

PHYSIOLOGY. Historical and Theoretical.—In the section of physiology of the British Association, Prof. McKendrick, of Glasgow, began his presidential address on the relation of physical and chemical structure as understood at present in our conception of the structure of living matter, with a reference to the advance that had been made in physiology during the past quarter of a century. In its progress physiology had proved a living and logical inductive science, grappling its problems successfully by the help of the same laws that physics and chemistry apply to non-living matter and its phenomena. It had in the last quarter of a century proved fruitful of discovery to an astonishing extent. Many of its discoveries were of high practical use in medicine as well as of theoretical value. It had struck deep into the soil, acquiring many new data of extreme accuracy, and obtaining much profounder insight into the concatenations of the machinery of life. The phenomena of muscular contraction, the process of secretion by gland cells, the mutual synergy of organs as illustrated by internal secretion, the functional architecture of the nervous system, the mechanics of rejuvenescence of protoplasm by sexual recombination (fertilization); all these branches of the physiological tree of knowledge had, under the cultivation of the last twenty-five years, grown greatly in extent and yielded blossom and valuable fruit. Facts more accurate and theories more profound had drawn their science closer to the elder sister sciences of more systematic measurement, and at the same time had created, it must be admitted, a gap between it and subjects with which it had formerly been associated in teaching. Its advance had widened the educational field and educational worth of physiology, releasing it from former restriction to narrower technical applications. Save in mathematics, knowledge can not be absolute in any domain of science. Physiology shared with the sister sciences their birthright of problems that were, to speak a paradox, the more insoluble the farther we progressed toward their solution.

The volume on the history of physiology during the sixteenth, seventeenth, and eighteenth cen-

turies, by Sir Michael Foster, published in the Cambridge University Press Biological Series, consists of lectures delivered in the summer of 1900 before the Cooper Medical College, San Francisco, Cal. Without claiming to be a complete history of the subject, the book contains a high summary of the chief advances made in physiology in the time of Vesalius until the beginning of the nineteenth century.

The lines along which sound theory would direct the teaching of physiology in medical schools are laid down by Dr. W. T. Porter, of the Harvard Medical School, in the *Philadelphia Medical Journal*, in a series of maxims as follow: "Deal so far as possible with the phenomena themselves, and not with the description of them. Where the fundamental experiments can not be performed, fill the gap with the original protocols from the classical sources. Associate facts which the student can observe for himself with those which he can not observe. Use as the basis of professional instruction, where practicable, the facts and methods to be used by the student in earning his living. Teach the elements by practical work. Let the student state his observations and results in a laboratory note-book, which, with the graphic records of his experiments, shall form one of the requirements for the degree. Control his progress and remove his difficulties by a daily written examination and a daily conference, in which the instructor shall discuss the observations made by the student, and supplement them from his own reading. . . . Demand of every student a written discussion of some very limited thesis, giving the results of the original investigators, together with any observations the student has made for himself. Give the more capable students opportunity for original experimental work. Toward the end of the instruction, when the student is ripe for such work, offer a liberal number of courses of didactic lectures, with demonstrations. . . . These lectures should show the student the historical development of scientific problems, the nature of scientific evidence, and the canons of criticism that help to sift the wheat from the chaff of controversy. From the beginning to the end of the instruction hold fast to concentration, sequence, and election." Concentration upon the one subject in hand, a correct sequence of study, and election, from the numerous objects of study that present themselves, of those which are directly associated with his future work as practitioner or investigator. To meet the needs of the several classes of students, the department of physiology should provide the primary course, suitable for every student of biological science, including medicine. An advanced course, intermediate between the primary course and research, and opportunities for physiological research.

The theory that life is a form of energy nearly allied to chemism has been further elaborated by Prof. Giglio-Tos in a book entitled *Les Problèmes de la Vie*. This author assumes that the function of assimilation, or the transformation of digested food into an integral part of the organism, is a chemical phenomenon, quite analogous to the transformations which many organic chemical compounds may be made to undergo in laboratories. Having established five fundamental conditions to which a molecule must conform in order to manifest the phenomena of assimilation, the author explains his theory of the process. It supposes that protoplasm consists of ultimate assimilative living particles called "bimolecules," which unite into polymolecular aggregates called biomeres, which in turn unite into an aggregate

called a bioplasma, which performs all the functions of life, and is, substantially, a cell. Reproduction is under this view discontinuous growth due to chemical assimilation as described, while the figures accompanying cell division are the morphological consequences of the chemical assimilative powers of the bimolecules constituting the cell.

Respiration.—A special interest is attached to hibernating mammals, because the rise which occurs in the temperature of their bodies during the awakening from torpidity is greater and more rapid than any other elevation of temperature that can be observed in animals. Hibernation is, moreover, a physiological condition in which the processes of combustion are reduced to the lowest ebb compatible with the life of mammals. During this winter sleep the animal responds to changes in the external temperature in a similar way to that shown by a cold-blooded animal. In summer, when it is awake and active, it has the characteristics of a warm-blooded animal. From his studies of the phenomena in the marmot, M. S. Pembrey has found that in the active animal the respiratory change differs somewhat from that of the rabbit. The discharge of water from the lungs is much smaller, and greater variations are seen in the respiratory quotient. During torpidity the respiratory change is small and characterized by the small respiratory quotient, 0.53. The sleeping animal gains in weight, for although it loses water and carbonic dioxid, it absorbs a greater weight of oxygen. The amount of moisture given off is small, and relatively to the carbon dioxid dissolved is much smaller than in the active animal. The respiratory quotient 0.53 observed in the hibernating mammal is probably to be explained by the combustion of fat and the formation of sugar, which is stored up as glycogen in the liver and muscles. During the awakening or passage from torpidity to activity, a great increase takes place in the respiratory exchange, and the respiratory quotient rises. The discharge of moisture is only slightly augmented, and thus the ratio $\frac{\text{CO}_2}{\text{H}_2\text{O}}$ is even as high as 16, whereas the corresponding figure for the active animal is about 3. During the awakening, increased muscular action is observed, even violent shivering. The metabolism at this stage is probably the conversion of glycogen into sugar and the combustion of the latter during muscular contraction; at the same time there appears to be a combustion of fat and the formation of more glycogen and sugar. The respiratory movements show in frequency and type a relation to the animal's internal temperature and activity. Periodic breathing, Cheyne-Stokes respiration, is frequently seen when torpidity is not profound. During the stage of most rapid rise in the temperature of the awakening marmot shivering is observed, especially in the anterior half of the body, and the temperature of the mouth is several degrees above that of the rectum.

In experiments on the cat, T. G. Brodie found that the immediate action of intravenous injection of blood-serum is to cause arrest of inspiration, inhibition of the heart, and vascular dilatation, and that the effect persists for some time. The symptoms are reflex and are almost entirely absent if the vagi be previously divided in the neck. The effect is due to excitation of the pulmonary nerves, and is cut out by division of the pulmonary branches of the vagus, but not by division of the cardiac or lower branches. Repetition of the injection leads to the production of an immune state. The active substance in the serum is

a proteid of the albumin class, and is coagulated on being heated to 86° C. It is produced only when the blood clots. Serum obtained from plasma is inactive.

Of the branches of the vagus, excitation of the central end of which causes reflex inhibition of the heart, the pulmonary fibers were found by T. G. Brodie and A. F. Russell to be in dogs the ones that produce the most marked reaction. The cardiac fibers were much less effective, and the branches below the pulmonary were still less so. The connection of the respiratory tract with the cardio-inhibitory center is very close. Thus stimulation of the nasal mucous membrane at once arrests the heart. Stimulation of the laryngeal mucous membrane is only a little less effective. Stimulation of the trachea and large bronchi is apparently without effect, but stimulation of the alveolar nerves is about as effective as of the laryngeal. These nerves produce a result when excited electrically in their course from the mucous membrane or when stimulated mechanically or chemically in the mucous membrane itself. Excitation of the pulmonary nerves also acts upon the respiratory and vasomotor centers, producing arrest of respiration and fall of blood-pressure. Alveolar nerves can be excited chemically by inhalation through a tracheal tube of irritant vapors or by injection of such substances as serum or egg white. Division of the pulmonary nerves on both sides abolishes the effect on the cardiac, respiratory, and vasomotor centers.

Circulation.—By means of a new method for investigation of the action of drugs on the mammalian heart, Dr. T. G. Brodie, of London, found that chloroform depressed the working capacity vastly more than ether in ethylene chlorid. Suprarenal extract much increased the amount of work performed by the heart, and also its rate of beat. It acted as an antidote to chloroform. If it was administered before chloroform it was found that the heart could withstand much larger doses of that drug. Moreover, a heart deeply injured by chloroform would rapidly and completely recover if suprarenal extract was administered. It had been constantly found in the course of the research that the heart was very sensitive to the blood of different mammalian species. Thus the heart of the dog went quickly into fibrillar incoordination unless fed with dog's blood; ox blood and other kinds of blood acting deleteriously at once.

In experiments of Dr. F. S. Locke, of London, on the action of dextrose on the mammalian heart, the heart, removed from a freshly killed rabbit, was washed clear from blood and suspended freely, and an arrangement was made for recording the contractions by means of a lever attached to the apex. Kept at a temperature of 35° C., and fed with a moderate Ringer's fluid, the contractions gradually grew feeble and ultimately very weak. If, then, oxygen under pressure was introduced into the fluid feeding the coronary arteries, the beats rapidly increased and remained good for about an hour; then they once more diminished and failed. Dextrose then added to the feeding fluid to the extent of 1 per cent. restored the beat, and it continued with hardly noticeable failure for about ten hours. The beating fell at once if for the dextrose in the feeding fluid the oxygenated Ringer solution without any dextrose was substituted, but the beat was restored on returning again to the sugared fluid. Sucrose, levulose, and other sugars as yet tried failed to give evidence of this restorative power.

It is shown by Prof. Hédon, of Montpellier,

that the hemolytic glucosides are more globulicidal in saline solutions than in serum. Substances therefore exist in the serum that may be regarded as protecting the red corpuscles against the toxicity of these glucosides. A little serum added to the water in which they are swimming protects tadpoles against the toxicity of glucosides (saponin, cyclamin) that are otherwise violently poisonous to them. Similarly, acid sodium phosphate protects the red corpuscles from the action of solenin, and protects fish if added to the water of the aquarium.

In the International Physiological Congress in Turin, Prof. Hürthle, of Breslau, demonstrated by graphic records obtained by his new *Stromuhr* that an increase in the speed of the flow of blood in the carotid was produced by compression of the opposite carotid; increase by section of the vago-sympathetic; slowing of the blood-stream in the crural artery by stimulation of the nerves of the limb muscles; and that the blood-stream in the arteries as measured by the volume of blood flowing along the channel in a given time increased not in simple proportion to the increase of actual pressure, but in much greater ratio.

The studies of Prof. Kemp, of Illinois, and Miss Calhoun of the blood-platelets in their relation to coagulation of the blood-plasma go to confirm the observation of Bizzozzo that the blood of a living dog can be reduced to an incoagulable condition by repeated "whippings" and reinjections. The incoagulable blood contains no platelets, but has some, though few, leucocytes. The authors find that in normal clotting the blood-platelets break down, while the leucocytes do not. The fibrin filaments radiate from disintegrating blood-platelets at the nodes of the network they form.

Dr. Uhlen-Luth, of Greifswald, and Drs. Wassermann and Schutze, of Berlin, are independent discoverers of a method of distinguishing human blood from the blood of animals. The reaction upon which it depends is obtainable from blood-stains, however old, and corresponds with the fact that the blood-serum of animals which have been injected with the blood of an animal of a different species, when added to a dilution of blood from the latter, produces a well-marked precipitate in it. Thus, if a rabbit be injected with human blood, the serum of the rabbit blood, when added to a dilution of human blood, causes immediate turbidity, while it does not when added to dilutions of any other kind of blood. One element of uncertainty arises from the fact that the blood of monkeys reacts, to some extent, in the same way as human blood, but there is considerable difference in the length of time required for the two reactions to produce cloudiness.

Digestion.—Experiments on forced feeding are described by W. Hale White and E. I. Spriggs, in which the intake and output of a subject put on a varied diet for fifty-five days were estimated. During the period the subject increased in weight 13.256 kilos, which, the initial weight being 39.23 kilos, represented an addition of one-third. Of fat taken daily, 96.5 per cent. was utilized. The average intake of nitrogen was 38.95 grams, equivalent to 244 grams of proteid, per day. The average quantity of fat being 251.88 grams, it follows that about equal quantities of fat and proteid were given. The observations were held fully to support the fact that if much fat is given in proportion to proteid, nitrogenous equilibrium is only slowly attained. The total amount of nitrogen given during the fifty-five days was 2,142.54 grams (average, as above, 38.95 grams a day). Of this amount, 1,481.50 grams were recovered in urine and feces, leaving 661.04 grams stored in

the body to be got rid of in some other way. The conclusion is drawn that there was a deficiency of output as compared with intake of nitrogen in fifty-five days of at least 120 grams, or 2.3 per cent. of the amount ingested; and that the increase in weight was no doubt due to the fact that was probably nearer 10 per cent.

The movements of the large intestine differ from the studies of W. M. Bayless and R. H. Starling to be, like those of the small intestine, under the control of the local nervous mechanism. The peristaltic contraction of the isolated bowel is due to the combination of ascending excitatory and descending inhibitory impulses started in local nerve plexuses by the presence of a stimulating agent in the lumen of the bowel. The activity of the local mechanism diminishes from the ileo-cæcal valve to the anus, so that under normal circumstances the extrinsic innervation is of more importance than the intrinsic in the emptying of the lower segment of the colon. Sympathetic supply to the colon (colonic splanchnia) has a purely inhibitory effect on both coats of the bowel. The pelvic visceral nerve is motor to both coats.

Dr. O. Cohnheim, of Heidelberg, reported to the International Physiological Congress in Turin that in his experiments on the disappearance of peptones placed under the influence of intestinal mucose the pepsins were not changed by albumin, but were split up into crystallized cleavage products. The cleavage was accomplished by means of a ferment—crepsin—produced by the intestine, which was active on peptones but not on albumin.

In his investigations of the subject, Prof. Alberoni, of Bologna, found that the sugars (glucose, saccharose, and levulose) were not absorbed in the ratio of their osmotic tensions. The absorption of lactose, whether in low-tension or high-tension solutions, was always less than the rate for glucose or saccharose. In the intestine the author always found a field of higher osmotic tension than that of the blood. A slight increase of the osmotic tension of the blood was observed during the absorption of sugar.

In experiments on the part played by the spleen in pancreatic digestion, Dr. Drouin, of Paris, united the esophagus to the duodenum in the dog, and converting the stomach into an independent *cul-de-sac* opening on the surface by a fistula, eliminated gastric digestion, and leaving pancreatic action to perform the chief part in the work, excised the spleen. The excision produced no appreciable difference in the assimilative powers, digestive activity, or apparent well-being of the animal. The removal of the spleen seemed, further, in no way to alter the quality or quantity of the juice excreted by the fistulous stomach.

The Glands.—Changes in the volume of the submaxillary gland as recorded plethysmographically have been studied by J. L. Bunch and classed as passive and active. The author finds that the gland reacts passively to changes in the general blood-pressure, its volume rising and falling synchronously with the latter. Thus we get a shrinkage of the gland on stimulating the vagus or on clamping both carotids, either of which procedures diminishes the supply of blood to the gland. On the other hand, the gland swells synchronously with the rise of blood-pressure which normally follows cessation of vagal inhibition. The active changes in volume of the gland are conditioned by two factors, vascular and secretory. In many cases both of these factors are involved, the result being an algebraic summation of the effects of each factor. All activity of the gland accom-

panied by secretion causes a diminution in its volume so marked that in most cases it overpowers the effects of any simultaneous vasodilatation. Since there is no diminution in the lymph flow from the gland, but rather a slight increase during the period of stimulation, we must conclude that the effect of the secretory nerves is simply and solely upon the secretory cells, the increased exudation from the blood-vessels which must in the last instance supply the fluid for the secretion being a secondary phenomenon determined entirely by the metabolic changes of the cells and lagging behind these to a considerable extent. There is no evidence to show that a sympathetic secretion is brought about through the medium of a muscular mechanism.

In a study of the gaseous metabolism of the submaxillary gland, with especial reference to the effect of chorda activity on the respiration of the gland, Mr. Joseph Bancroft, of Cambridge, found that, during the excretion of saliva induced by the stimulation of the chorda tympani, the oxygen taken from the submaxillary gland was increased to an amount three or four times that taken up by the resting gland; that the carbonic acid given out by the gland was increased under the same circumstances to an equal or even greater extent; and that after an injection of atropin sufficient to cause paralysis of the secretion, the intake of oxygen by the gland was not increased by stimulation of the chorda tympani, while, on the other hand, the output of carbonic acid was increased, at least for a time.

Experiments made by Drs. Gull and Fowler in the study of the question whether the spleen is connected with the production of blood-corpuscles gave results—as to the blood entering and leaving the spleen—that there was no difference in the blood of the splenic vein and the splenic artery, and further, that removal of the spleen (of the dog, rabbit, and cat) produced no perceptible change in the number of the corpuscles of the blood; and that the recovery of the number of corpuscles after hemorrhage and hemolytics proceeded as fast in animals without spleen as in those with spleen.

In a preliminary communication on the metabolism of creatinin, J. J. R. Macleod sets forth several facts of peculiar interest which presented themselves in his investigation, especially with regard to variations in the quantity of that substance excreted in urine in various diseases. The experiments indicate that creatinin excreted by urine may be divided into an endogenous and an exogenous quotient, the former arising from the metabolism in the animal's own tissues, the latter from the creatin and creatinin introduced in the food. Since the total amount of creatinin excreted, therefore, must vary with the diet in the omnivorous animal, it is necessary, in studying the variations in the excretion of this body in the intestine, to place the patient on a creatinin-free diet. This was done in several diseases, more especially in muscular atrophy and splenic enlargement. In the former disease no diminution was found. In splenic enlargement, however, a diminution of the excretion of about 50 per cent. was obtained. Reasons are given for supposing that the diminution is probably not dependent on the number of leucocytes, but on the size of the spleen. In other words, it would appear that the spleen exercises some influence on the metabolism of creatinin.

The evidence afforded by the experiments of Prof. Gley, of Paris, on the function and interdependence of the thyroid and parathyroid glands was both chemical and biological. The author

regarded the parathyroids as complementary in functions and structure to the main thyroid.

Secretions.—In a paper communicated to the Royal Society by Benjamin Moore and W. H. Parker evidence was brought forward that the bile exercises an important action as a solvent; and this the authors claimed to be the chief, if not the only, function of that secretion. It was pointed out that the bile in this respect has a two-fold action: first, in aiding the secretion of cholesterolin and lecithin; and, second, in aiding the absorption of fatty acids and sodium soaps from the intestine. All these substances possess a low solubility in water, and have their solubility increased in bile chiefly by the virtue of the properties of the bile salts. The fact that cholesterolin is but slightly soluble in bile explains the fact that gall-stones are composed almost exclusively of that substance, while lecithin is very soluble in bile, and hence is never deposited. This view as to the action of the bile is regarded as also furnishing an easy explanation for what is called circulation of the bile, and as accounting for the faulty absorption of fat in the absence of either bile or pancreatic juice, and the almost complete failure of fat absorption when both of these excretions are excluded from the pancreatic canal.

Studies are reported by Prof. Moussu, of Alfort, of the lymph flow in the limbs of the larger animals (horse, ox, etc.) during repose and inaction and then under conditions of local vasoconstriction and vasodilatation and under those of general augmentation of blood-pressure and of copious venous depletion. The author had further observed the lymph flow under the influence of muscular work and under conditions of great activity. The general conclusions reached by him are that the lymph is not a simple product of a translation from the blood-plasma through the capillary wall under the mechanical pressure of the blood circulation; that filtration is always quite a minor factor in the production of lymph; that the lymph is mostly a product of the tissues comparable to a secretion from them; that the quantity of its production is in direct relation to the functional activity of the tissues; and that the peripheral (limb) lymphatic apparatus is in large measure an apparatus for secretion.

Studies of the effects of venous obstruction on the secretion of urine by D. H. De Souza go to show that ligation of the renal vein is not followed within the duration of an ordinary experiment by coagulation of the blood within the vein or its branches. Obstruction of the renal vein, whether partial or complete, always caused diminution or cessation of urinary secretion, which, however, was not immediate. The flow of urine from the kidney was directly proportional, other things being equal, to the velocity of the blood flow through the kidney. The nature of the glomerular function must be regarded as still undecided. Secretory activity on the part of the cells of the glomerular epithelium is still unproved, and the majority of the facts may be explained without ascribing to this epithelium other than a purely passive function as a filtering membrane, impermeable in most cases to proteids. Such an explanation, however, throws all the work of regulation of urinary composition, either in a positive or negative direction, on the cells of the urinary tubules.

Watery extracts of the pituitary body have been found by R. Magnus and E. A. Schäfer to produce rise of blood-pressure by contracting the systematic arterioles, much in the same way as extracts of suprarenal medulla produces its well-known pressure reaction.

The origin of the pepsin which is secreted by the urine has been found by Drs. Delezenne and Drouin, of Paris, to be in the gastric juice.

Muscular System.—An investigation of the isometric value of active muscle excited directly and indirectly was undertaken by H. R. Dean with the view of comparing the tension developed in active muscle when directly stimulated and when stimulated through its nerve. The conclusion was reached that the total tension developed by a muscle in response to a direct excitation is greater than that which can be elicited by the maximal stimulation of its nerve, and that the increased mechanical efficiency of the directly excited muscle is not due to the summation of an indirect with a direct response, or to variations in the position of the starting-point of the response; it is thus little influenced by such alteration in the time of the active processes, as must occur if the position of the starting-point is changed. The result presents several points of interest in connection with muscular activity, which are described in the author's paper.

The influence of the ingestion of sugar upon rigor mortis was the subject of experiments by Dr. Frederick Lee, of New York, and Dr. C. C. Harrold, who found that the administration of dextrin before their death to fasting cats which had been treated with phlorizin delayed the rigor of the muscles which usually ensues a few minutes afterward. Absence of carbohydrate from the muscles favored the development of rigor, but was unfavorable to contraction.

The use of the telephone in investigating the rhythmic phenomena of the muscles was described in the British Association by Sir J. Burdon-Sanderson, whose paper was based largely on the researches of Miss Florence Buchanan.

In sixteen experiments on the effect of muscular work upon the digestibility of food and the metabolism of nitrogen carried on by Prof. C. F. Wait at the University of Tennessee, it appeared that, comparing the elimination of nitrogen in the urine during the periods of little muscular activity and normal diet with that during periods of increased activity and a diet furnishing energy largely in excess of the heat equivalent of the measured work performed, a slight decrease took place under the latter condition. This was true even when the possibility of a lag of considerable duration between the breaking down of nitrogenous material within the body and the excretion of nitrogen in the urine was admitted.

The presence of some enzyme in muscle having the power of breaking up the sugar with which the muscle is supplied through the blood, and converting this food into energy with the formation of simpler organized bodies, had been suspected by physiologists for some time. An experiment by Brunton in 1873 which seemed to prove it was liable to criticism for its method; and other experiments reported were inexact, because the material used had not been proved free from possible fermentative organisms. In a research described by T. Lauder Brunton and Herbert Rhodes before the Royal Society the muscle juice, collected with great care, was filtered through a Pasteur-Chamberland candle, the other fluids were boiled, and the apparatus was disinfected by steam. Two flasks were prepared, each containing fresh sterile muscle juice and sugar solution. In one flask the muscle juice was boiled previous to adding the sugar solution. After incubation at body temperature, the sugar in each flask was estimated quantitatively, when a very marked diminution was observed in the percentage of sugar in the flask containing unboiled juice. It was

thus shown that a substance exists in the muscle which has the power of breaking up the sugar molecules; and this substance, it may be said, partakes of the nature of a ferment. Although an attempt has been made to isolate the enzyme, it is of such a delicate nature that the isolating process adopted destroyed its fermenting powers.

From the results of an investigation of the effect of the substitution of alcohol for sugar in the food upon muscular action in the dog, carried on through observations of the respiratory coefficient, M. A. Chauveau concludes that the alcohol introduced, although very rapidly absorbed by the organism, participates only to a small extent, if at all, in the combustions from which the muscular system draws the energy necessary to its working. The alcohol is not an energy-producing food, but its introduction into food has rather the opposite effect. This effect is pronounced unfavorable from all points of view, being marked by a diminution in the absolute value of the muscular work, and an increase in the food used up with respect to the amount of work accomplished.

The Nervous System.—It was for a long time regarded as impossible for an adult creature so high in the animal kingdom as a dog to live for any considerable time after being deprived of both cerebral hemispheres. Prof. Goltz has, however, succeeded in removing both hemispheres from a dog and keeping the animal alive in this brainless condition for several months. He first removed the left hemisphere by two separate operations, in June and November, 1889; and afterward the right hemisphere, in June, 1890. The basal part of the temporal lobe was allowed to remain, lest the optic tracts should be injured in their removal. The animal was finally killed, in December, 1890. Its physiological condition was described by the experimenter in the German Archives for General Physiology, and a full abstract of the paper is given in Schäfer's Text-Book of Physiology, vol. ii, page 302. No complete anatomical examination of the nervous system had been published till the subject was undertaken by Gordon H. Holmes, who found that removal of the cerebral cortex caused complete degeneration in most of the cells and sclerosis in the glia of the optic thalamus and diminution in the myelinated fibers in the gray matter of the interbrain, though both changes were less marked in the ventral nucleus—results that go far to show that Goltz's hope that a subsequent operation would succeed in removing the mantle and leaving the interbrain in the normal state will never be realized, so clearly is the existence of the one dependent on the integrity of the other. Degeneration was also observed in the cortico-spinal and cortico-pontal tracts, in all parts of the fornix which are separated from the cornu ammonis, and a localized degeneration in the corpora-mammillaria. Removal of the cortex had no appreciable influence on the corpus striatum or the radiatio striothalamia, but the latter tract degenerated when the corpus striatum was injured, and proportionately to the extent of the injury. Great degeneration was caused in certain nerve-cells of the primary optic centers—viz., the pulvinar lateral geniculate bodies and anterior quadrigeminal bodies, but the splittings up of the optic fibers within the gray masses remained unaffected, and no appreciable changes occurred in the optic tracts or nerves which could be attributed to this degeneration. As a whole, the parts of the brain of the animal which degenerated on removal of the cerebral cortex were those which are not repre-

sented in the brains of those lower animals that have no functional pallium.

In a paper in the British Association on the return of voluntary movements after alteration of nerve supply by nerve crossing or anastomosis, Dr. Kennedy, of Glasgow, said that his experiments on animals had shown that when the nerves supplying the flexor muscles of a limb were divided and cross-united to the nerves supplying the extensor muscles, the animal in time regained the functional use of the limb, although the innervation of the muscle group was reversed. The principle of nerve crossing found a practical application in many cases of paralysis of a muscle or group of muscles supplied by a particular nerve.

Prof. Langendorff reported to the International Physiological Congress in Turin upon a restoration of function which had occurred one hundred and five days after total extirpation of the superior cervical ganglion of the cat. The signs of paralysis in the eye had then nearly passed off; they returned at once on section of the sympathetic nerve in the neck. Electrical excitation of the upper end of the cut nerve trunk gave strong dilatation of the pupil and the palpebral fissure and retraction of the membrana nictitans. Microscopical examination failed to reveal any reappearance or regeneration of the ganglion, but the sympathetic fibers must have found their way to their appropriate end-stations.

It is maintained by Prof. Wedenski, of St. Petersburg, that all general excitants of nerve exhibit three successive phases of influence, viz., a phase in which the rhythm of the excitation exhibits modification in the rhythm of the response; a phase in which there is a depression of conductivity of the excited state; and a phase of depression of all response to excitation. The author supposes a fundamental similarity of inhibition to necrosis of nerve.

Experiments made by Prof. Vitzou, of Bucharest, to test the supposed inexcitability of the gray matter of the spinal cord to artificial stimuli are regarded by him as demonstrating that the spinal gray matter is excitable by faradic currents.

Prof. J. N. Langley, of Cambridge, England, reported to the International Congress of Physiology in Turin concerning his investigations of the group reactions to drugs and blood conditions of the different neurons which make up the nerve system. He demonstrated the stimulating action of nicotine on the neurons of the superior cervical ganglion in evidence of his view that the drug alters the cell-bodies of that ganglion. Since the suggestion of Carl Huber, of Ann Arbor, it had been customary to suppose that the incidence of the action of nicotine on the sympathetic ganglia lies at the terminal fibrils of the preganglion neurons. The author found that if the preganglion fibers were cut and allowed time for regeneration, the local application of nicotine to the ganglion produced its normal stimulation effect. Applied to a ganglion of the sympathetic chain, nicotine caused erection of hairs only in the region supplied by the ganglion; if it stimulated the preganglionic nerve-endings, axon-reflexes would move the hairs in other regions. Nicotin probably did not paralyze spinal ganglion cells; it did not stop the passage of impulses through the bipolar cells of the spinal ganglions of the skate. The erection of the hairs of the cat which occurs after asphyxia does not occur if the sympathetic pilomotor nerve-cells have been separated from the spinal cord. This blood stimulant acts, therefore, on the intraspinal pilomotor cells.

Prof. Langley also spoke, in illustration of the

same theme, of the effects of suprarenal extract on a number of tissues and organs where he had examined its action. His new results, together with those previously ascertained, showed that in all cases the extract produced an effect of the same kind as that produced by stimulation of the sympathetic nerve, and not like that produced by a cranial or sacral autonomic nerve. Notwithstanding this, the action of the extract appeared to be directly upon the tissue, not upon the sympathetic nerve-endings; thus it produced pallor and secretion of the submaxillary gland, and this after degeneration of the post-ganglionic fibers of the cervical sympathetic. The inhibitory effect of the vagus upon the cardiac sphincter of the stomach was demonstrated to the meeting.

From experiments relating to the centripetal and centrifugal medullated nerve-fibers arising in the spinal ganglia of mammals, H. H. Dale finds that there are a few more medullated fibers in the trunk than in the nerve-roots, the excess consisting probably of fibers which pass the trunk by way of the gray portion of the ramus communicans and end in connection with the vessels or other tissue of the ganglion.

In studies of the action of anesthetics on the neurons of rabbits and dogs, H. Wright found that ether and chloroform anesthesia cause certain changes in the nerve-cells of both brain and spinal cord. These are slight at first, but become more pronounced as the anesthesia is continued. The Nissl granules lost their affinity for methylene blue, and the cells presented a rarefied or, in extreme cases, a skeleton-like appearance. In rabbits there also appeared an early and constant moniliform enlargement of the tips and stems of the chief dendritic extensions of many pyramidal cells, growing in size and spreading along the dendrons toward the cell body as the anesthesia was continued. The changes were regarded as due directly to the influence of the anesthetics. A venous congestion observed also appears to be a secondary phenomenon and is not to be regarded as the cause of changes in nerve-cells. As ether and chloroform are said to circulate in the blood as such, neuronal changes are regarded as biochemical in nature, and produced by the anesthetic that reaches them through blood-streams. Whether the facts described occur also in the human subject, it is impossible to say. But the author does not consider that there is any analogy between the changes described and the biochemical anabolic and katabolic changes that occur in daily life and mark our waking and sleeping hours. He regards the action of the narcotics here as pathological—not intensely so, but remote from physiological processes. These observations were afterward supplemented and extended by additional experiments on dogs, with the twofold object of determining whether a still more prolonged period of anesthesia renders the changes more intense and of ascertaining, by examining the tissues of the animals after the anesthesia had passed off, whether the pseudo-degenerative change is permanent. The answer to the first question was affirmative; to the second negative. The results confirmed the previous work, and show that ether and chloroform act directly upon the chromatic substance of the perikaryon, chemically changing it so that it loses its affinity for anilin dyes. The biochemical change was more intense in the later experiments than in the others, because the anesthesia was kept up longer. Indications were found that after a certain period of anesthesia (six hours in the dog) the depression of the neuronal function becomes more rapidly profound, and there is a limit

of time of safe anesthesia. The histological changes, too, support this view. The changes described in the cells were only transitory, and disappeared with the disappearance of the drugs from the circulation and tissues, or soon after. Further evidence was afforded that the moniliform swelling of the dendrons was not due to simple retraction of the neurons, but was the result of a pathological change in the trophic center of the neuron. It appears analogous to the swelling observed in the first stage of atrophy in axons when cut off from their trophic centers. Rarefaction of all substance and function of the moniliform swellings may modify nervous functions, and to such changes may perhaps be attributed those losses of memory, slight manias, and melancholias that are now and then reported to follow prolonged anesthesia in the human subject.

Special Senses.—Describing studies of dilatation of the pupil from stimulation of the cortex cerebri, Herbert Parsons observes that the effect is best obtained with slight anesthesia. It often occurs without any movement of the eyes or body, but most markedly in those epileptic convulsions that often follow frequent or prolonged excitation. It is never seen with deep anesthesia. In the absence of epileptic conditions it is only obtained from those parts of the brain which are concerned in eye movements. When well marked, dilatation of the pupil is accompanied by all the usual effects of stimulating the cervical sympathetic. The effect is sometimes more marked on the opposite eye, and is diminished, but by no means abolished, by section of both sympathetic nerves in the neck. Other sympathetic effects are abolished. It is not influenced by section of the fifth nerves intracranially after previous section of the cervical sympathetics, but is abolished after such section of the third nerves. It is not abolished on either side by section of the corpus callosum. In the absence of the usual dilator tracts, the effect is probably due to an inhibition of the tonic action of the third nerves.

The principal cause of irregular astigmatism is found by F. J. Allen to be fibrous structure of the crystalline lens. The three groups of fibers in the lens cause unequal bending of the sight in three different directions, so that a luminous point appears to a normal eye to be surrounded by three groups of radiating lines, in the form of an inverted V. The author has tried to discover the exact *modus operandi* of the lens fibers and its bearing on ordinary defects of refraction and their correction by glasses. It is not clear whether the distortion is due to diffraction or to uneven refraction. The following features can be demonstrated by experiment: 1. The radiating lines which appear on any side of the subjective rational image are caused by fibers which lie on the same actual side of the lens. 2. The focus of the aberrant rays is nearer the lens than the proper or general focus, therefore convex spectacles increase the distortion of the image, and concave spectacles diminish it. 3. Distortion increases as the pupil dilates, bringing the peripheral fibers of the lens into the field. It follows that convex glasses, which improve definition in a good light, may sometimes cause blurring when the light is weak enough to allow the pupil to dilate widely. Irregular astigmatism increases with age. Owing to presbyopia it may not be apparent to the naked eye. But when the general refraction is corrected by convex lenses, the exaggerated distortion becomes evident.

In an investigation of the monaural localization of sound, Prof. J. R. Angell and Dr. Warner Fite made observations on a person entirely deaf

in one ear, with parallel observations in some cases upon a person with normal hearing. The results point to qualitative differences in sounds coming from different directions as due to the localization. Such qualitative differences may be due to the damping or reinforcing of certain partial tones by the organs of the ear and head, and it is noteworthy that generally some tones are unlocalizable in monaural hearing. The presence of eye-reflexes was often very marked, and the final localization was frequently made on the basis of the eye-strain and the supposed direction of the sound. This statement, however, leaves untouched the physiological basis of the eye-movements. Finally, there is no good evidence for supposing that extraneous sensations play any part in the localization.

Experiments were described by Prof. Hensen, of Kiel, at the International Physiological Congress, which afford evidence of the existence of an accommodation mechanism for the ear.

Miscellaneous.—In the Wilde Lecture at Manchester, England, the subject being the microbial flora of the human body, Dr. Elie Metchnikoff, after describing the various microbial growths on various parts of the body—in the conjunctiva of the eye, the follicles of the skin, the teeth, and the digestive organs—considered their functions. Speaking of the greater rapidity with which wounds inside the mouth are healed as compared with those on the outer skin, he suggested that, moistened by the saliva, such wounds remained in contact with the microbes and their soluble products, which stimulated the reaction of the human organism. The secretions of the microbes attracted a great number of white blood-corpuscles, which cleaned the wound—cleared it of microbes and mortified tissues—and so favored the process of recovery. In the lower parts of the digestive system this function of microbes was less important, the mucous membrane there being much more seldom torn. But it was probable that the acids secreted by many bacteria in the small intestine rendered a real service by preventing the development of certain other microbes which might impede digestion. This preventive function was also manifested in the course of conflict between the human organism and microbes of a very dangerous kind, and there was reason to believe that in some cases the germs of Asiatic cholera were rendered innocuous by the action of the microbes which they encountered in the intestines. It had also been contended by some authorities that the microbes in the digestive system played an important part in the digestion of food, and that without them blood could not be assimilated; but the data available would lead rather to the general conclusion that for the normal action of the human digestion the presence of the intestinal microbes was by no means indispensable. They should now try to ascertain whether the microbes in the human system might injure its health. When the defensive forces of the body flagged, the microbes of the skin began to multiply and pour their noxious products into the tissues and the blood. Boils and anthrax were thus often developed in persons suffering from diabetes or other general disease. But the greatest harm was done by the microbes of the stomach and intestines. It had been recognized that the gravity of the danger incurred in cases of perforation of the intestine was due to the inflammatory action of the microbes that escaped into the peritoneum. The microbes further produced soluble substances which could be absorbed through the wall of the intestines and so make their way into the circulation. Several of these

were substances more or less poisonous in their action, and it was very probable that a great many of these toxic products of our intestinal flora had still to be ascertained. There was reason to affirm that the poisons produced by the intestinal microbes played a considerable part in causing many and various maladies.

Muscle serum, although it is taken normally into the stomach as a food substance, has been found by M. C. Richet to produce strong toxic effects when injected under the skin. These effects do not follow when the serum has been coagulated by heat.

A microscopical examination has been made by Dr. R. J. A. Berry for the purpose of determining what, if any, analogy exists between the apex of the cæcum of the lower animals and its equivalent, the vermiform appendix in man. Three types of animals were selected—the rabbit, the cat, and the pigeon. In them a marked accumulation of lymphoid tissue was found at the cæcal apex, which reached its maximum development in the cat within one week after birth. From these developments, combined with the comparison of the corresponding arrangements in other animals, the conclusion was reached that lymphoid tissue is the characteristic feature of the cæcal apex, the vermiform appendix in man being represented in the vertebrate kingdom by a mass of lymphoid tissue, situated more frequently at the cæcal apex; that as the vertebral scale is ascended, the lymphoid tissue tends to be collected into a specially differentiated portion of the intestinal canal, the vermiform appendix; and that this appendix in man is not therefore a vestigial structure, but is a specialized part of the alimentary canal.

The conclusion is drawn from analytical studies by T. B. Osborne and E. F. Campbell that the protein of egg yolk is principally a lecithin compound, soluble in salt solutions, and in its behavior resembling a globulin. Preparations of crystallized egg albumen obtained and described by T. B. Osborne indicated that other proteid bodies are associated with the substance ordinarily known as ovalbumen. The authors have since repeated their work on a larger scale, with confirmation of the earlier observations and the acquisition of a number of facts concerning these and other protein substances.

Some remarkable analogies have been observed by G. Bredig and K. Ikeda and M. V. Berneck between the behavior of a solution of colloidal platinum and that of the organic enzymes, especially those present in the blood. Among them is the fact that just as minute traces of certain substances inhibit the catalytic action of the enzymes of the blood, so traces of the same or similar substances act as "poisons" to colloidal platinum, the quantities necessary being in some cases extremely small. The work of the authors is expected to lead to more quantitative studies of the catalytic action of the enzymes proper, the importance of which in animal and plant physiology is becoming every day more manifest.

Catalase is the name of a new enzyme of general occurrence which is described by Dr. Oscar Loew with special reference to the tobacco plant. It possesses the power of producing catalytic decomposition of hydrogen peroxide—a decomposition which is probably not produced by any other known enzyme. It appears to exist in a soluble and an insoluble form, which are designated as α catalase and β catalase. The former is wholly a compound of the soluble catalase with a nucleoprotein, while the β form is an albumin, and can be liberated by the action of very dilute alkaline

media upon the insoluble catalase. The action of this enzyme appears to be an oxidizing one. The most characteristic reaction studied in this direction has been its rapid oxidation of hydroquinone to quinone. Numerous tests have established the general occurrence of catalase in the vegetable kingdom. No living plant or vegetable organ was found free from it, some plants containing more of the soluble, others more of the insoluble form. In the animal kingdom it also appears to be widely distributed, having been found in aqueous extracts of spleen, pancreas, liver, kidney, brain, muscle, and blood serum. Infusoria, insects, worms, and mollusks were also examined, with positive results.

Existing methods of obtaining actual intercellular tissue are criticized by Sydney Rowland, of London, as having a common defect of principle in that they grind by attrition. The most successful of them is apparently that of Buchner, who has succeeded in obtaining the intracellular juice of yeast-cells. The details of it have not been published. A method described by Mr. Rowland depends on percussion. It is first necessary to reduce the size of the organized elements of the tissue or cell to that of the smallest elements. This is accomplished by submitting the minced organ to the violent and rapidly succeeding impacts of particles of some solid substance harder than the tissue to be ruptured, and of a comparable size with its individual elements. The mass of material thus resulting is a paste consisting of minute particles of proteid or other constituent material, suspended in the liquefied intracellular substances, and mixed with more or less blood products. The separation of the solids from the liquids of this mass may be produced by centrifugalizing or by filtering. Both of these means are, however, slow and uncertain. A method of interstitial filtration similar to the so-called filter-pressing operation of many industrial processes gives a perfectly clear solution. The material contains the actual intracellular liquid substances, and if the disintegrating processes are carried on at such a temperature as will arrest chemical action—in liquid air, for example—it is difficult to see what (other than physical) differences can exist between such a juice and the living liquid substance. Several ways of using the method thus generalized are indicated by the author. It can be adopted for bacteria, glands, organs, yeast, and even for so refractory a material as lead. Mr. Rowland describes the modification most convenient for glands and organs, and his apparatus adapted to them. It consists of a disintegrator, a vertical revolving steel spindle with horizontal vanes or paddles overlapping one another by 90°, and a filter press, in which the juice is expressed from a mixture of the disintegrated mass and *Kieselguhr*.

The formation of "skin" or film in warming milk has been studied by R. Jamieson and A. J. Hertz, of Oxford, who find that it is not a peculiar property of caseinogen or lactalbumin, as a similar film is produced on warming any proteid solution containing emulsified fat or paraffin; that the film is probably formed of unchanged dried proteid in the case of non-coagulable proteids, and in that of coagulable proteids if the temperature is kept below the coagulation point. If the temperature is higher, the film, with the latter, is composed, partly at any rate, of coagulable proteid. Globules of fat or paraffin are entangled in the skin. Drying is an essential condition for the formation of a film. The authors propose the following as a hypothesis to explain these phenomena: Particles suspended in colloid solution are surrounded by

molecules of the colloid aggregated together to a greater extent than elsewhere in the solution. On warming, the suspended particles circulate; those reaching the surface are dried and aggregate to form films.

It has been found by Dr. Pugliese, of Bologna, and Prof. Aducco that the addition of sodium chlorid to the water taken by fasting animals considerably increases their resistance to inanition. When the tissues of animals as similar as possible in other respects, but in the one case having water only, and in the other salt and water, were analyzed, the tissues under the latter condition were found to contain relatively the more water. Also, the amount of water excreted by the animals receiving salt water was less than the amount excreted by animals receiving water without salt.

The thermal conductivity of the human skin formed the subject of an investigation described by M. J. Lefevre in the *Journal de Physique*. Regarding the skin as a wall about two millimeters thick, three coefficients have to be found—namely, the surface conductivity, the true conductivity through the substance forming the skin, and the internal surface conductivity between the skin and the adjoining tissues. The experiments showed that the skin is a bad conductor, its true conductivity being about the same as that of wood, of the same order as that of gutta-percha, about five or six times that of wool, and seven hundred and fifty times that of air. The conductivity is only half as great at 5° as at 30° C. The exterior surface conductivity of the skin in contact with water appears to be approximately independent of the temperature, but the coefficient across the surface separating the skin from the adjoining tissues increases considerably as the temperature falls from 30° to 5° C.; and the latter increase more than counterbalances the decrease in true conductivity, so that the loss of heat at 5° C. is twice or three times as great as it would be according to Newton's law.

PORTO RICO, formerly a colony of Spain, ceded to the United States in the treaty of peace concluded at Paris on Dec. 11, 1898. The island was under military rule in the beginning of 1901. The Governor was Brig.-Gen. G. W. Davis.

The area of the island is about 3,600 square miles. The population in 1899 was 953,243. There are about 70,000 negroes and 240,000 mulattoes. San Juan, the capital, had 32,048 inhabitants in 1899; Ponce, 27,952; Mayaguez, 15,187. The revenue collected by the Spanish Government in 1895 was 5,454,958 pesos, and the expenditure was 3,905,667 pesos.

The most important product is coffee, which occupies 200,000 acres. The quality is in general superior, and the annual yield is 60,000,000 pounds. Sugar occupies 50,000 acres, the annual product being 47,000 tons. The yield of tobacco from 3,000 acres is 12,000,000 pounds. From July 28, 1898, the date of the American occupation, till Dec. 31, 1899, the imports amounted to \$12,546,542, and exports to \$11,621,049. Cotton goods, rice, flour, and provisions are the principal imports. Of the total imports \$4,815,135 came from the United States, \$2,610,076 from Spain, \$2,070,343 from Great Britain, and \$1,492,577 from Germany. The export of coffee was \$6,482,894 in value; of sugar and molasses, \$3,195,032. Of the total exports \$3,358,980 went to the United States, \$2,856,556 to France, \$1,489,665 to Cuba, and \$1,353,570 to Spain. There are 137 miles of railroads, 470 miles of telegraphs, and an extensive telephone system. During 1897 there were 1,135 vessels, of 1,356,989 tons, entered at Porto Rican ports.

The Foraker act of April 12, 1900, imposed a duty of 15 per cent. of the rates of the Dingley tariff on importations from the United States into Porto Rico and importation into the United States of Porto Rican products, the duty collected to be paid over to the insular treasury. This duty was declared by the Supreme Court of the United States in a decision rendered on May 27, 1901, to be legal, but not the duties collected prior to the enactment of the law, Porto Rico being from the time of the cession of Spain appurtenant to the United States as a possession and not foreign territory, but not a part of the United States, and therefore not subject to the clause of the Constitution which requires that duties, imposts, and excises shall be uniform throughout the United States. The Hollander act imposed an excise duty of 60 cents a gallon on rum in Porto Rico, payable at the time of the sale and shipment from the distillery, the stamp being attached to the bill of lading. A similar duty was imposed on Porto Rican cigars. In 1900 there were produced 801,858 gallons of rum and \$364,951 worth of cigars.

PORTUGAL, a kingdom in southwestern Europe. The throne is hereditary in the family of Saxe-Coburg-Braganza. The reigning sovereign is King Carlos I, born Sept. 28, 1863, successor to his father, Luiz I, who died Oct. 19, 1889. The heir apparent is Luiz Philippe, Duke of Braganza, born March 21, 1887, son of the King and Marie Amélie, daughter of Philippe, Duke of Orleans, the late Count of Paris. The legislative power is vested in the Cortes, consisting of a Chamber of Peers, containing 52 hereditary, 13 spiritual, and 90 life members, and a Chamber of Deputies, containing 120 members elected by the direct suffrage of citizens possessing an elementary education or an income of 500 milreis. The Cabinet of Ministers, constituted on June 25, 1900, consisted in the beginning of 1901 of the following members: Prime Minister and Minister of the Interior, E. R. Hintze Ribeiro; Minister of Foreign Affairs, João M. Arroyo; Minister of Finance, A. Andrade; Minister of Justice and Worship, A. Campos Henriques; Minister of War, L. A. Pimentel Pinto; Minister of Marine and the Colonies, A. Teixeira de Sousa; Minister of Public Works, Industry, and Commerce, J. J. Pereira dos Santos.

Area and Population.—Portugal has an area of 34,528 square miles, with 4,660,095 inhabitants on Dec. 31, 1890, exclusive of the Atlantic islands, of which the Azores, with an area of 1,005 square miles, had 255,594, and Madeira, with an area of 505 square miles, had 134,040 inhabitants, making the total area of the kingdom 36,038 square miles and the total population 5,049,729. Lisbon, the capital, had 301,206 inhabitants. The number of emigrants in 1897 was 21,612, of whom 243 were destined for European countries, 3 for Asia, 1,541 for Africa, 17,993 for Brazil, 1,815 for other parts of America, and 16 for Oceania. In 1898 the total number was 23,510, of whom 230 went to Europe, 4 to Asia, 1,854 to Africa, and 21,422 to America. Education, though nominally compulsory, is not general. In 1890 only 20.8 per cent. of the population could read and write. There were 4,483 primary public schools in 1899, the expenditure on education being 1,178,593 milreis for that year.

Finance.—The revenue for the fiscal year 1900 was estimated at 49,713,000 milreis, and expenditure at 49,941,000 milreis. For 1901 the approved estimates were 52,188,125 milreis for revenue, including 1,150,000 milreis of extraordinary receipts, and 54,848,957 milreis for expenditure, including

2,112,229 milreis of extraordinary expenditure, leaving a deficit of 2,660,832 milreis. For 1902 the revenue was estimated at 53,269,000 milreis, and expenditure at 55,239,000 milreis.

The public debt in 1900 consisted of £41,727,171 of external 3-per-cent. consolidated bonds, £1,818,914 of 4-per-cent., and £12,779,780 of 4½-per-cent. redeemable external bonds, £8,773,000 of the 4½-per-cent. tobacco loan, and £87,894,879 of 3-per-cent. internal bonds, making the total debt outstanding £152,993,744, not including £6,148,820 of 4- and 4½-per-cent. bonds of other classes and the floating debt, which amounted to 44,653,414 milreis on Jan. 1, 1900.

The Army and Navy.—The military law of Sept. 7, 1899, divides continental Portugal into four military districts and the islands into two commands. The army is organized into 27 regiments of infantry, 4 regiments of chasseurs, 8 regiments of cavalry, 4 regiments of field-artillery, 2 batteries of horse-artillery, 2 batteries of mountain-artillery, 2 regiments of garrison-artillery, and 1 regiment of engineers. The active army on the peace footing consists of 1,723 officers and 29,703 men, with 5,404 horses and mules, and 144 guns. There are besides 81 officers and 297 men of the reserve troops in active service, and 80 officers and 2,176 men of the municipal guards, and 136 officers and 5,619 men of the fiscal guard that are incorporated with the army in case of war. The war strength of the active army is 2,029 officers and 82,843 men, with 10,736 horses and mules and 216 guns; and the strength of the reserves is 1,447 officers and 62,796 men, with 5,113 horses and mules and 46 guns, making the total war effective 3,476 officers and 145,639 men, with 15,849 horses and mules and 312 guns.

The Portuguese navy consists of 1 armor-clad, 5 protected cruisers of from 1,800 to 4,100 tons, 2 new and 4 old cruisers, 16 gunboats, 10 river gunboats, and 15 first-class and 30 small torpedo-boats. By the aid of a national defense association the cruiser *Adamaster*, of 1,933 tons, has been built at Leghorn and the *Rainha Amelia*, of 1,660 tons, at Lisbon. The *São Gabriel* and *São Raphael*, of 1,800 tons, were launched at Havre in 1898. The *Don Carlos I.*, of 4,100 tons, launched at Elswick in 1899, has a 4-inch deck, carries 4 6-inch, 8 4.7-inch, 12 3-pounder, and 6 smaller quick-firers, and can steam 22 knots. The old ironclad *Vasco da Gama*, of 2,420 tons, is being reconstructed and armed with 4 8-inch quick-firing guns.

Commerce and Production.—Wine is the chief product of the country, and next comes cork. Olive-oil is produced in large quantities. Pineapples and figs are the principal fruits, and oranges next. Tomatoes, onions, and potatoes are raised for export. Cotton goods are manufactured and exported to the African colonies. There are mines of copper, sulfur, lead, coal, arsenic, tin, and other ores and minerals. Salt, gypsum, lime, and marble are exported. The total value of special imports in 1899, including precious metals, was 51,522,882 milreis; of exports, 30,052,225 milreis. The imports of live animals were 1,844,727 milreis in value, and the exports 2,647,739 milreis; imports of raw materials for manufactures were 21,348,630 milreis, and the exports 4,931,685 milreis; imports of textile manufactures were 6,252,598 milreis, and exports 2,858,755 milreis; imports of articles of food were 14,095,102 milreis, and exports 16,338,816 milreis; imports of machinery were 3,504,889 milreis, and exports 141,061 milreis; imports of miscellaneous manufactures were 3,476,188 milreis, and exports 1,922,892 milreis; the value of packing in imports was

102,606 milreis; the imports of coin and bullion were 898,142 milreis, and exports 1,216,277 milreis. The larger imports in the special trade were wheat of the value of 4,216,996 milreis; raw cotton, 3,486,001 milreis; coal, 3,213,990 milreis; cotton goods and yarn, 2,615,846 milreis; iron, 2,470,418 milreis; corn, 2,172,301 milreis; sugar, 2,109,776 milreis; codfish, 1,931,589 milreis; wool, 1,661,337 milreis; leather and skins, 1,071,565 milreis; woolen goods and yarn, 1,059,626 milreis; cattle, 783,428 milreis; coffee, 570,909 milreis. The leading exports of domestic products were wine of the value of 10,913,689 milreis; cork, 3,040,556 milreis; cotton manufactures, 2,504,996 milreis; copper ore, 957,142 milreis; sardines, 956,549 milreis; horses, asses, and mules, 854,644 milreis; olive-oil, 552,870 milreis; cattle, 355,579 milreis; eggs, 319,965 milreis; almonds, 264,431 milreis; pineapples, 243,260 milreis; figs, 232,853 milreis; onions, 169,341 milreis; tunny, 135,681 milreis. The exports of wine consisted of 51,846,870 liters of ordinary wine, 765,590 liters of liqueur wine, 2,510,500 liters of Madeira, and 27,916,800 liters of port. The ordinary wine is exported to Brazil and to Portuguese colonies, the heavier wines mainly to Great Britain, of whose total imports of wine in 1899 the wines of Portugal constituted 22.8 per cent. of the quantity and 20.9 per cent. of the value.

Navigation.—The number of vessels in the foreign trade entered at the ports of Portugal, Madeira, and the Azores during 1899 was 5,663, of 8,552,744 tons; cleared, 5,640, of 8,575,971 tons. Of the vessels entered 3,865, of 5,917,374 tons, had cargoes; of those cleared, 4,367, of 6,649,172 tons. The number of vessels entered coastwise during 1899 was 4,149, of 1,226,394 tons; cleared, 4,037, of 1,136,611 tons.

Political Affairs.—The financial question outweighs all others in Portugal. Although a gradual improvement is observable in the development of commerce and navigation and the general well-being of the nation, in the traffic of sea-ports and railroads, in the importance and values of the industries, still in the budget there is an excess of expenditure over revenue year after year, and in 1901 more than in previous years, augmenting the floating debt, while the burden of the rate of exchange was heavier than before, and the circulation of paper money had reached the limit. In the speech from the throne at the opening of the Cortes on Jan. 2 the public authorities were warned not to enter into engagements or authorize expenditure which the resources of the treasury could not meet. To obtain the largest possible amount from the public taxes it was necessary to simplify the methods of procedure in their collection. It was necessary to profit by and utilize the increase in the productive forces of the country, to protect and to promote individual initiative in the carrying out of agricultural development, industrial undertakings, and commercial operations, and so to organize administration that it should be economical and efficient. The Government was unable to present a budget in which revenue and expenditures balanced, and left it for the future to reveal a remedy.

The French creditors of Portugal asked for the intervention of their Government to protect their interests. The French Government, protesting that the financial measures taken by Portugal were in conflict with all established principles, and that the creditors had been robbed of a part of the revenues assigned to them for the payment of the debt, made strong representations to the Portuguese Government, and proposed a convention, to which the Portuguese Government would not agree. This attitude of Portugal made a bad im-

pression in Germany, England, and Belgium, as well as in France, and all the governments raised vigorous protests, to which the Portuguese Government replied with an expression of regret that the financial situation forbade the acceptance of the proposals at the moment, but if this improved sufficiently Portugal would then be willing to take up the negotiations again. The French Minister of Foreign Affairs declared that if Portugal was unwilling to revoke the measures that were prejudicial to the creditors, he possessed means of bringing pressure in Lisbon which he would not hesitate to use. The principal measure referred to was the arbitrary reduction by the law of April 20, 1893, of the interest on the external debt, payable in gold, to only one-third of the agreed interest. The interest on the internal debt, payable in currency, had been reduced 30 per cent. the year before, the finances having become so disordered in 1891 that the treasury could not meet its current obligations. The public debt in 1890, practically the whole of which had been contracted since 1850, was 258,086,897 milreis in internal, 46,366,759 milreis in external, 104,172,464 milreis in redeemable, and 19,565,172 milreis in floating obligations; total, 428,191,292 milreis. In 1900 the total obligations were 756,294,952 milreis, not reckoning the premium on the gold debt. The Government owed the Bank of Portugal 26,750,105 milreis. The bank had 69,833,406 notes in circulation, protected by a metallic reserve of 13,137,683 milreis. These notes are the currency of the country. Gold has been the legal standard of value since 1851, but only 7,950,000 milreis of gold coins have been minted since that date, none at all since 1891, while the silver coinage has amounted to 30,352,436 milreis. When Portugal partially repudiated its foreign debt an international commission of financial control was proposed by several foreign governments. The suggestion roused a storm of protests in Portugal. Minister of Finance Arroyo declared in the Cortes on Feb. 26, 1901, that the Government would in dealing with the foreign debt firmly maintain the position created by the law of 1893, and if any alteration of that law were to be considered the financial independence of the country would be defended and no form of financial control admitted, not even an indirect control, nor should the financial resources of the treasury be unduly weighted.

The anticlerical sentiment which stirred up popular passions in Spain spread into Portugal, and an incident occurred in the early part of 1901 which made the question of the monastic orders one of practical political concern. The Jesuits, who enjoyed the favor of the Queen, influenced the wealthy daughter of Dr. Calmon, the Brazilian consul in Oporto, so that she desired to enter a convent. She was a maiden thirty-two years old, but her parents would not consent. When she was coming with them from church one morning an attempt was made by Jesuits and persons they had brought to help them to tear her away from the parents, which would have succeeded had not friends rushed to their assistance. The Brazilian Government asked an explanation of this attempt to abduct one of its citizens. The Republican newspapers printed virulent attacks on the Clericals, who were fiercely assailed by the whole Liberal press. Students and citizens of Oporto made demonstrations in the streets, and the police used their weapons in attempting to disperse them, wounding some of them. Two days later a mob gathered before the house of the Clerical politician who was believed to have instigated the attempt to take the lady away from her

natural protectors by force, and attempted to burn it down. The police fired into the crowd with their revolvers, and cavalry patrolled the streets for the protection of other citizens. The Portuguese Government ordered the provincial governors of the various provinces to make inquiries into the position of the monastic confraternities with a view to taking measures in regard to them. As a result of the investigations a decree was issued on April 20 requiring the secularization of the existing congregations within six months, and in addition declaring it necessary for them, in order to secure a legal status, to devote themselves to works of benevolence, charity, or education, or to the propagation, but only in the colonies, of the faith and civilization. These conditions involved the closing of 7 Franciscan, Jesuit, and Benedictine establishments, in addition to 10 convents which had already been closed, and their occupants expelled, by the local authorities. The decree announced further that the supreme direction of each association must be in the hands of Portuguese citizens unless the association is composed exclusively of foreigners. The Cortes ended their session on May 27, and were dissolved by royal decree on June 5. Elections were appointed to take place in October for the new Cortes, to meet on Jan. 2, 1902.

The Republicans were greatly excited over a supposed design of the Government to cede colonial territories to a foreign power. In the speech from the throne reference was made to an arrangement with England to permit transit over Portuguese territory in Africa for military purposes in the Transvaal war and to the visit in the Tagus of a British squadron on a special mission as emphasizing the public affirmation of the close alliance and friendship which unites the two nations, and which recent acts had still more strongly accentuated. In South Africa Portuguese action was described as having assured at once the rights of sovereignty and the duties of hospitality enjoined by kindly international customs. The compact entered into with England is supposed to have been, in return for Portugal's compliant action in straining the obligations of neutrality, a promise by Great Britain to respect the sovereign rights of Portugal over her African possessions, to which the concurrence of Germany was obtained. The consul of the Netherlands, Mr. Pott, who protected the interests of the Boers in Lourenço Marques, had his exequatur withdrawn on the ground that he had been engaged in the importation of heliographic apparatus for the Transvaal artillery and had granted passports wrongfully.

An agreement was made with Great Britain for the delimitation of the territory between Angola and Barotseland. The passage of a German expedition through Portuguese territory gave rise to a rumor that the German flag had been raised at Quanhama, and demands were made in the press for a delimitation of the frontier between Angola and German Southwest Africa.

Colonies.—The Portuguese retain in India the small colony of Goa on the Malabar coast. Its area is 1,390 square miles, its population 494,836. The salt-works produce 12,200 tons a year. Salt is produced also in the dependent territory of Damao and on the island of Diu, which have together an area of 168 square miles and a population of 77,454. The revenue of Goa for 1900 was estimated at 940,886 milreis, and expenditure at 1,057,564 milreis. The imports in 1899 were 668,275 rupees in value, and the exports 416,723 rupees. The transit trade with British India was valued at 19,925,350 rupees. A railroad, 51 miles

in length, connects with the British Indian system. There is a military force of 1,630 men, of whom 1,426 are natives.

Macao, an island at the mouth of the Canton river in China, with the dependent islands of Taipa and Coloane, has an area of 4 square miles and a population of 78,627, comprising 3,106 native Portuguese, 615 natives of Portugal, 177 other Portuguese, 161 foreigners, and 74,568 Chinese. The Chinese live in a separate quarter, and have their own administration in the city of Macao. The revenue of the colony for 1900 was estimated at 441,378 milreis, and expenditure at 405,397 milreis. The imports in 1898 were 8,768,356 milreis in value; exports, 8,203,906 milreis. Opium is manufactured in Macao for exportation to the United States and Australia, but this trade, amounting to 1,285,000 milreis in 1896, is on the decline. The commerce is chiefly transit, and is in the hands of Chinese.

The colony of *Timor* occupies the eastern part of the island of that name, and includes the neighboring island of Pulo Cambing. The revenue in 1900 was estimated at 144,531 milreis, of which Macao contributed 32,400 milreis; expenditure, 176,069 milreis. The colony was formerly administered from Macao, but since 1896 has had a separate administration. A delimitation of the Portuguese and Dutch parts of the island has been arranged. The area of the Portuguese possession is estimated at 7,458 square miles; the population at 300,000. Coffee is grown for export, and wax and other products are exported. The value of imports in 1897 was 318,312 milreis; of exports, 246,503 milreis.

In Africa Portugal possesses territories having an estimated total area of 792,040 square miles and 8,197,790 inhabitants. The *Cape Verde Islands* have an area of 1,480 square miles, with 114,130 inhabitants in 1896, mostly of mixed Portuguese and negro descent. Coffee, medicinal plants, and millet are produced. The revenue for 1900 was estimated at 364,129 milreis and expenditure at 319,941 milreis. The imports in 1898 were 1,558,047 milreis; exports, 194,608 milreis. The ports were visited by 3,225 vessels, of 3,365,137 tons.

The area of *Portuguese Guinea* is 4,400 square miles, with 820,000 inhabitants. The revenue in 1900 was estimated at 56,655 milreis, and expenditure at 216,742 milreis. The value of imports in 1898 was 458,566 milreis; exports, 223,136 milreis. The chief articles of export are rubber, wax, oilseeds, ivory, and skins.

The islands of *St. Thomas* and *Principe* have an area of 360 square miles and 24,660 inhabitants. The creole planters raise cacao in St. Thomas and coffee in Principe. Cinchona is another product. The revenue in 1900 was estimated at 404,196 milreis, and expenditure at 322,732 milreis. The value of imports in 1898 was 1,663,914 milreis, and of exports 2,536,978 milreis. The export of coffee was 1,825,776 kilograms, valued at 354,593 milreis; of cacao, 8,323,057 kilograms, valued at 1,132,148 milreis; value of cinchona, 29,686 milreis; of coconuts, 11,500 milreis.

Angola has an estimated area of 484,800 square miles and 4,119,000 inhabitants. The revenue in 1900 was estimated at 1,673,111 milreis, expenditure at 2,013,671 milreis. The military force was 4,010 men, of whom 2,858 were natives. The value of imports in 1899 was 6,314,846 milreis, against 6,187,263 in 1898; exports, 7,035,414 milreis, against 7,169,127 milreis. The number of ocean-going vessels that entered the ports of Ambriz, Loanda, Benguela, and Mossamedes in 1899 was 328, of 566,236 tons. There were 244 miles of

railroad in operation in 1899. The telegraph-lines had a length of 635 miles. The principal products are coffee and rubber, and after these wax, sugar, oils, coconuts, ivory, cattle, and fish. Copper, malachite, iron, petroleum, salt, and gold are found.

On the opposite coast of Africa from Angola Portugal possesses a territory embracing 301,000 square miles, with an estimated population of 3,120,000 (see SOUTH AFRICA).

PRESBYTERIANS. I. Presbyterian Church in the United States of America.—The following is the general summary of the statistics of this Church as they were officially published in the volume of the minutes of the General Assembly for 1901: Number of synods, 32; of presbyteries, 233; of churches, 7,779; of ministers, 7,532; of candidates for the ministry, 917; of licentiates, 336; of elders, 28,764; of deacons, 9,974; of communicants, 1,025,388; of members added during the year on examination, 54,252; of baptisms, 19,072 of adults and 26,163 of infants; of members of Sabbath-schools, 1,058,110; amount of contributions for the year—for home missions, \$1,252,159; for foreign missions, \$907,739; for education, \$93,397; for Sabbath-school work, \$122,850; for church erection, \$179,078; for the Relief fund, \$97,531; for the freedmen, \$144,695; for synodical aid, \$94,728; for the General Assembly, \$74,335; for aid for colleges, \$274,415; for congregational purposes, \$12,152,088; miscellaneous contributions, \$945,361; total, \$16,338,361. The number of communicants was 17,699 larger than in the previous year. The number of candidates for the ministry showed a continuous decrease, it being 591 less than in 1896, while the number of ministers was larger than in any previous year. A decided increase is shown in the total amount of contributions, which was \$1,284,075 larger than in 1900, and the largest in the history of the Church.

The Board of Education closed the year with a surplus, and a reserve fund which, after adding a legacy of \$5,000 recently received, would amount to \$17,973. The number of students under the care of the board had been steadily decreasing for several years, having fallen from 911 in 1897 to 600 in 1901.

The Board of Aid for Colleges during the eighteen years of its existence had aided 78 institutions in 29 States and Territories, while 36 schools had been founded with its help, its investment being secured by bond and mortgage. The total value of the property thus secured was \$1,521,158. The burden of debt had been removed from 26 institutions. The policy of the board now was not further to aid an institution that incurs a debt. Thirteen schools had secured endowment funds, so far amounting to \$413,754. The total sum gathered, used, or invested in eighteen years was \$2,312,909.

The Board of Ministerial Relief had had 931 names upon its roll of beneficiaries, 114 new names having been added during the year. The sum of \$38,825 had been paid to 136 honorably retired ministers. The total receipts for the year had been \$194,146.

The Board of Church Erection reported 227 applications made to it during the year, the total amount asked for (as loans or grants) being \$154,877. Appropriations had been made from the General fund of \$64,554 to 141 churches. From the Manse fund allotments had been made of \$26,780 to 63 churches. Other loans had been made from certain special funds, and special gifts, making the whole year's work amount to \$123,484 appropriated to 224 churches. One hundred and

eighty-four churches and manses, valued at \$476,948, had been completed during the year without debt.

The work of the Sabbath-School and Missionary Department of the Board of Publication and Sabbath-School Work had been carried on in 30 States and Territories, and Havana, Cuba. Ninety-three missionaries had been in commission, 767 Sabbath-schools had been organized and 304 re-organized, having in all 38,260 members. Of 66 churches the outgrowth of Sabbath-schools organized by the missionaries of the board, 54 were Presbyterian, with an aggregate membership of 1,067. The year's business of the publishing house amounted to \$500,000, and the profits to \$24,000, two-thirds of which had been given to the Sabbath-school department for its missionary work. The net capital of the board was now \$218,260.

The report of the Board of Home Missions gave the following statistics of the work: Number of missionaries, including 28 Mexican and Indian helpers, 1,342; of missionary teachers, 425; of members, 76,993; of members of congregations, 86,423; of Sabbath-schools, 2,018, with 117,113 members; of additions during the year on profession of faith, 7,207; of baptisms, 3,050 of adults and 3,386 of infants; of Sabbath-schools organized, 281; of church edifices, 1,520, valued at \$3,116,110; of church edifices built during the year, 63, at a total cost of \$128,164, while 250 church edifices were enlarged and repaired, at a cost of \$67,285; amount of church debts canceled, \$95,681; number of churches having reached self-support, 31; of churches organized, 37; of parsonages, 432, valued at \$464,720.

The Board of Missions to Freedmen had received during the year \$163,265, the amount showing a considerable increase over the receipts of the previous year, which were, in turn, larger than those of the year preceding. The sum of \$82,066, or \$10,304 more than in the previous year, had further been contributed to self-support on the field and reported to the board, but not entered in its accounts. An effort to raise \$250,000 for the endowment of Biddle University was approved by the General Assembly as a part of the Twentieth Century fund movement.

The treasurer's balance sheet of the Board of Foreign Missions showed total current assets of \$609,990; total invested assets, \$1,274,150; current liabilities, \$527,434; other liabilities, \$1,355,093, leaving an apparent surplus of \$1,621.

A considerable part of the report of the board was devoted to an account of affairs and conditions of the missions in China, in connection with the "Boxer" troubles, under which 5 missionaries had lost their lives and 178 communicants had suffered death at Peking and Pao-Ting-Fu. In the other mission fields the work had been prosperous, in some places even more so than in the most fruitful years of the past. The missionary force numbered 299 men and 416 women (715 European missionaries), 583 native ordained preachers and licentiates, and 1,258 other helpers—in all, 1,841 native assistants. The 636 native churches returned 41,599 communicants, 4,481 having been added during the year, while 718 schools were maintained, with 25,910 pupils, besides 38,137 pupils in Sabbath-schools. Eighty-four students were preparing for the ministry. The board had 117 mission stations and 1,182 out-stations in 13 different countries.

The receipts of the Woman's Board of Home Missions for the year had been \$357,201. Especial mention was made in the report of the large amount—\$39,367—paid for tuition. The freed-

men's department had received \$1,000, an increase of \$5,898. An increased demand for Bibles and Testaments was reported. Work among the un-Americanized races had been a feature of the General Assembly as the special field of the board, with responsibility to the Board of Home Missions.

The treasurer of the Women's Board of Home Missions reported that the contributions for the year had amounted to \$70,767.

The one hundred and thirteenth General Assembly met in Philadelphia, Pa., May 15. The Rev. Henry C. Minton, D. D., Stuart Professor of Systematic Theology in San Francisco Theological Seminary, was chosen moderator. A motion to repeal the "Peoria overture" (see Annual Cyclopædia for 1900) adopted by the preceding General Assembly was lost. The second day's sessions of the Assembly were given, in accordance with the program marked out by the previous General Assembly, to the celebration of the Twentieth Century. Three meetings were held in the Academy of Music, where addresses were delivered by selected speakers, and a Historical and Missionary Exhibit of the Church was opened in the Academy of Fine Arts. The treasurer of the Twentieth Century fund reported that the amount contributed to the fund to date—including only gifts actually made in legal form, returns of which had been filed in the treasurer's office—was \$3,397,031. In addition to this amount, mention was made, as not included in report, of contributions in St. Louis, Mo., of \$180,000 to a single enterprise, and of the subscriptions that had been made toward the effort to remove the mortgage on the Presbyterian building in the city of New York. The sum reported as subscribed had come from about 1,000 of the 7,800 churches represented in the General Assembly. The contributions were distributed among the several objects of benevolence, as follows: For the boards of the Church, \$106,030; for colleges and academies, \$330,642; for the theological seminaries, \$110,767; for hospitals, \$61,659; for the Young Men's Christian Association, \$117,464; for miscellaneous purposes, \$30,000; for payment of local debts upon churches, \$1,081,654; for improvements in local congregations (for church edifices and other improvements), \$1,537,913. The committee was continued for another year. In its resolutions on the subject the Assembly called upon every church in the denomination still burdened with debt and thus hindered from giving its full share to missions and benevolence, to remove its indebtedness within two years; invited consideration of the enlarged needs and opportunities of the various boards and other objects of contribution; and expressed its deliberate judgment "that it is the sacred duty and blessed privilege of the Church, at the beginning of the new century, to strengthen all the agencies and institutions employed in our work by furnishing a sum sufficient for their enlarged endowment and support."

The report of the Special Committee on Systematic Benevolence defined that term as applying, first, to the principles that should govern an individual church-member in his giving of money; and second, the arrangements that should be adopted by the churches, as churches, for their benevolent offerings; and expressed the belief that it was the teaching of Scripture that gifts of a church-member ought to be systematic rather than spasmodic; that they should be arranged for in advance, like other uses of money; that they should bear relation to the giver's receiving, never falling below some determined proportion of his income (one-tenth); and that definite accounts should be kept of them, so as to determine

whether the proportion has really been given. The committee recommended that the session of each church should, by some carefully arranged system, furnish the people opportunity to contribute every year to each of the boards. Instruction in methods of leading the people to a clearer recognition of their duty and privilege in the matter of giving was regarded as an important department of the training of young men for the ministry. Resolutions on the Sabbath reaffirmed the settled conviction of the Assembly that the law of the Sabbath is divine and of perpetual obligation upon all men; that the obligation of the preservation of its sacred character rests primarily upon the membership of the Church of Christ; renewed the request expressed in 1900 that Congress and the State legislatures make no more appropriations to industrial exhibitions except on condition that they are closed to visitors on the Lord's Day; affirmed the inalienable right "of every man to rest from labor on the Sabbath day, or the day commonly called Sunday," and requested corporations and all employers of labor to arrange for their men to enjoy it; and "most earnestly protested against any and all use of the Lord's Day as a day for business purposes and commercial interests, as well as against all uses of the day for sports, games, social functions, and worldly pleasures." A report was made by the Rev. Dr. R. S. Holmes on the effort to lift the mortgage on the "Presbyterian Building" in New York, showing that the amount to be raised had been reduced to \$250,000. The clearing away of the annual burden of \$48,000 interest would leave that amount to go into the treasuries of the Home and Foreign Mission Boards. The rentals of the building were about \$113,000 a year. The Special Committee on Theological Seminaries reported concerning conferences with representatives of those institutions that they were found to be agreed upon the more important subjects of conference, and no action of the General Assembly upon them was required. The Committee on Revision of the Confession of Faith reported a tabulated statement showing the votes of the presbyteries upon the questions which had been submitted to them to have been as follow: For revision, 47; for an explanatory statement, 11; for revision and an explanatory statement, 1; for a supplemental statement of doctrine, 52; for revision and a supplemental statement of doctrine, 15; for an explanatory statement and a supplemental statement, 1; for a substitute creed, 14; for an alternative creed, 1; for some change, 6; negative vote on all the questions, 4; indecisive vote, 1; for a dismissal of the whole subject, 50. Fifteen presbyteries in the United States and 16 in foreign lands were returned as not voting, the whole showing that 63 presbyteries favored some revision of the Confession of Faith and that 68 presbyteries favored some form of a supplemental statement of the "doctrines most surely believed among us." Majority and minority reports were presented on the general question. The minority report agreed with that of the majority except with regard to the section marked "B," from which it expressed dissent. This section recommended the appointment of a committee instructed "to prepare a brief summary of the Reformed faith, bearing the same relation to the Confession which the Shorter Catechism bears to the Larger Catechism, and formed on the general model of the Consensus Creed prepared for the Assembly of 1892 or the 'Articles of Faith' of the Presbyterian Church of England." The objection made to this instruction was that the action contemplated in it was not identical with the requests of the presbyteries,

and had therefore no considerable element in the Church which regarded it as at this time desirable; that it was liable to nearly all the objections which lie against a new creed; and that it erected an additional standard of orthodoxy. The Assembly, by a vote of 271 to 237, refused to adopt this report. Amendments were then made to the majority report, among which was one striking out the word "summary" in paragraph B and substituting for it the word "statement." The majority report as amended was adopted section by section, and was then finally adopted, as a whole, unanimously. It is as follows:

"A. We recommend that a committee as provided by the Form of Government, chapter xxiii, section 3, be appointed by this Assembly.

"B. We recommend that this committee be instructed to prepare and to submit to the next General Assembly, for such disposition as may be judged to be wise, a brief statement of the Reformed faith, expressed, as far as possible, in untechnical terms. The said statement is to be prepared with a view to its being employed to give information and a better understanding of our doctrinal beliefs and not with a view to its becoming a substitute for or an alternative of our Confession of Faith.

"C. We further recommend that this committee be instructed to prepare amendments to chapter iii; chapter x, section 3; chapter xvi, section 7; chapter xxii, section 3; and chapter xxv, section 6, of our Confession of Faith, either by modification of the text or by declaratory statement, but so far as possible by declaratory statement, so as more clearly to express the mind of the Church, with additional statements concerning the love of God for all men, missions, and the Holy Spirit. It being understood that the revision shall in no way impair the integrity of the system of doctrine set forth in our Confession and taught in the Holy Scripture."

The committee provided for in this action was made one of 21 members, and included the whole of the committee already existing and Moderator Minton, who was made chairman.

A plan for the institution of judicial commissions was approved to be sent down to be voted on by the presbyteries for adoption as an amendment to the Form of Government. It provides for the appointment of a standing commission of 15—8 ministers and 7 elders—the terms of 5 of whom shall expire every year, to be a court of final jurisdiction and sit by its own appointment. Another proposed amendment to the Form of Government sent down to the presbyteries provides that when societies within the Church for missionary and other benevolent and religious work cover only the territory included within a presbytery or synod, they shall be responsible only to such judicatories; but when they cover the territory of the entire Church they shall be responsible to the General Assembly. A plan of "vacancy and supply" was approved, under which the supervision of all vacant churches, within the bounds of each presbytery is assigned to a committee appointed by it. It shall be the duty of this committee to prepare and keep lists of all vacant churches within the bounds of the presbytery, and of all unemployed ministers available for work, and to arrange for the supply of the vacant churches from the list of available ministers or from such other sources as may be within its reach. The chairmen of all the presbyterial committees will constitute a synodical committee of similar character, which shall report to the General Assembly. A committee was appointed with the special duty of stimulating the

churches in evangelistic work, to consider the methods of such work and its conduct in relation to the churches. The report on Theological Seminaries, as adopted, sanctioned the union of the colleges and the theological seminaries in Kentucky into a single college and a single theological seminary respectively, as had been agreed upon by the local boards and judicatories having charge of the several institutions. Permission was given to the three presbyteries in Mexico to unite with the Southern Presbyterian presbytery there in the erection of the Synod of Mexico.

II. Presbyterian Church in the United States.—The following is a summary of the statistics of this Church reported to the General Assembly in May, 1901: Number of synods, 13; of presbyteries, 79; of ministers, 1,485, with 286 candidates and 64 licentiates; of churches, 2,991; of ruling elders, 9,234; of deacons, 7,876; of communicants, 227,991; of baptized non-communicants, 41,030; of members added on examination during the year, 8,319; of baptisms, 3,168 of adults and 4,596 of infants; of teachers in Sabbath-schools, 20,091; of pupils in Sabbath-schools, 149,567. Amount of contributions: For home missions (Assembly), \$26,317; evangelistic (local), \$124,872; for the Invalid fund, \$14,941; for foreign missions, \$134,745; for education, \$87,553; for publication, \$8,273; for colored evangelization, \$11,327; for the Bible cause, \$4,789; presbyterial, \$17,451; for pastors' salaries, \$814,308; for congregational purposes, \$795,510; miscellaneous contributions, \$125,593.

Small increases appear in most of the more important items.

The Executive Committee of Education reported that 75 of the 77 presbyteries were cooperating with it. One hundred and sixty-six beneficiaries had been enrolled and aided, in comparison with 195 in the previous year. The committee had received \$20,228 during the year, and had expended \$15,045.

The Assembly's home and school at Fredericksburg, Va., reported 37 orphans receiving instruction.

The year's accounts of the Executive Committee of Publication were balanced at \$46,980, while the assets were valued at \$117,185. Ten new books had been issued. The business of the publishing house had not equaled that of the previous year, which was, however, 25 per cent. larger than the average. Seven colporteurs had been in the field, and 10 young men had been employed during the summer months in Sabbath-school missions, and reported 49 Sabbath-schools organized, with 52 teachers and 891 pupils. The sum of \$5,171 had been appropriated for grants to needy Sabbath-schools, churches, and mission fields.

The Executive Committee of Colored Evangelization reported four evangelists engaged in the direct work of preaching to destitute colored people, and 40 mission schools for negroes, with 194 teachers and 2,321 pupils. The committee had aided in the building of 2 churches, had made appropriations for the erection of 4 others, had assisted a number of churches in making repairs, and had expended \$3,366 in keeping the churches under its care supplied with stated preaching. Four hundred and twenty students had been enrolled in the four schools of higher and academic grade. The committee had received \$7,460 on the General fund of colored evangelization, and \$3,009 on the Special Improvement fund of Stillman Institute; and had a balance of \$1,919 to the credit of the General fund.

The year's receipts of the General Assembly's Home Mission and Invalid fund had been \$55,-

356. The receipts for home mission had been \$26,916. Six missionaries had been supported among Mexicans, 75 ministers in Texas, 16 in Arkansas, 8 in Indian Territory, 16 in Florida, and 8 in the Indian schools. For the year the fund \$14,596 had been received, and \$12,413, 233 had been appropriated to 141 beneficiaries in 51 presbyteries, aiding 32 aged and infirm ministers and 109 widows and orphans of deceased ministers. Reports were made of work in the Indian Territory, Indian schools, the Mexican work in Texas, and work in New Mexico.

The Executive Committee of Foreign Missions had closed its year with a small balance over all liabilities. Its receipts from all sources had been \$163,056, or \$1,885 more than the receipts of the previous year. The sum of \$2,939 had been given for the Congo Boat fund. The total disbursements for the year, including the amount invested, had been \$173,653. One hundred and sixty-six missionaries had been employed. The number of additions to the native churches had been 642, an increase of 119 over the number reported in the previous year or in any year in the history of the board, and showing an average of more than 10 additions to each ordained missionary. A tabular statement was offered by the committee showing the growth of the missionary work and its cost during the past ten years, from which it appeared that the missionary force had increased from 85 in 1891 to 163 in 1900, and the total receipts from \$112,950 to \$161,162. The average cost of the work per missionary during the past five years had been between \$950 and \$1,000. This included the expense for home administration outfit, travel, and salaries of missionaries, house-building, and property purchased or rented, school and medical work, pay of native assistants, and all incidental expenses.

The General Assembly met at Little Rock, Ark., May 16. The Rev. Neander M. Woods, D. D., was chosen moderator. The *ad interim* committee appointed by the previous General Assembly to prepare amendments to the Book of Church Order on the subject of commissions presented majority and minority reports. The minority report was adopted and ordered sent down to the presbyteries for their approval. It defines a commission as "a body of presbyters to which an ecclesiastical court entrusts special powers for the performance of specific business. It differs from a committee in that it provisionally stands for and represents the court itself, and is empowered not only to examine and report, but also to deliberate upon, decide, and conclude the business submitted to it, its judgment on all issues submitted to it being in force from the time of the finding, and subject to the review of the court appointing it. Such review to be confined to errors of law and doctrine, unless by reason of newly discovered evidence it may be manifest that injustice will be done. To this end full records of the proceedings shall be submitted to the court, and if approved the judgment shall be entered on the records of that court as its final judgment. Committees are the executive agents of the Church and its courts, for the transaction of such business and the performance of such duties as may be entrusted to them. Every court of the Church has power to act by a commission, and to it may be properly committed the ordination of probationers for the ministry, the visitation of portions of the Church for the correction of disorders, the organization of churches, including the ordination of officers, the trial of judicial causes and similar cases requiring the exercise of authority and the judgment of the court. No judicial case, however,

coming up by way of appeal or complaint, from a lower to a higher court, shall be tried by commission without consent of parties; and in such cases, no member of a lower court who took part in the trial below shall be appointed on the commission. The ordination of probationers shall not be committed to a commission except in cases in which the presbytery shall have examined them and passed upon their fitness therefor."

Agreements had been made a few weeks before the meeting of the General Assembly, between the trustees of those institutions respectively, for the consolidation of Centre College, Danville, Ky., of the Northern Church, and Central University, Richmond, Ky., of the Southern Church, into a single institution to be known as the Central University of Kentucky; and of the Theological Seminary at Danville, Ky., of the Northern Church, and that at Louisville, Ky., of the Southern Church (Synods of Kentucky and Missouri), into a seminary to be called the Presbyterian Theological Seminary of Kentucky. On April 23, the synods interested in these institutions, the two synods of Kentucky (North and South), and the Synod of Missouri (South), had met in special session and given their sanction to the consolidations. The subject was brought before the Assembly which decided that it would interpose no bar to the union, but gave assent to it, leaving the entire responsibility thereof to the synods of Kentucky and Missouri. An Executive Committee of Ministerial Relief was instituted to take oversight of the whole work, including the administration of a relief fund for meeting the pressing needs of disabled ministers, and those of the families of deceased ministers. For collecting money for the purposes of this fund, the Assembly proposed reliance upon church collections, to be taken in July; "ministers' rates," or the payment of small sums annually by ministers who may be disposed to do so, and gifts and bequests to constitute an endowment. An *ad interim* Committee of Home Missions was designated, to be composed of the chairmen of the synodical committees of home missions, with instructions to take into consideration the whole matter of the home mission work of the Church, "in order to devise," if they "find it practicable, a more efficient plan of home mission work, and report the result to the next Assembly for its action." A department of Sabbath-schools and Young People's Societies was established. The action of the Assembly upon colored evangelization emphasized the duty of the Church toward the colored people, and suggested local organizations for work among them, and for the forcible presentation of the cause to the people. An order of the previous General Assembly directing the insertion of a footnote at the proper place in the Confession of Faith affirming that the Church does not teach the damnation of infants was rescinded. A catechism on The Church, prepared by a committee appointed for that purpose, was referred to the presbyteries for criticism.

III. United Presbyterian Church in North America.—The following is a summary of the statistics of this Church as reported to the General Assembly of 1901: Number of synods, 13; of presbyteries, 68; of ministers, 1,017, of whom 714 are enrolled as "pastors and stated supplies"; of licentiates, 84; of censures, 37; of students of theology, 68; of ruling elders, 3,908; of congregations, 995, of which 827 are provided with pastors and stated supplies; of mission stations in America, 32; of mission stations in the foreign field, 615; of new stations formed during the year, 15; of houses of worship erected, 20, at a

total cost of \$183,000; of parsonages, 350; of members in America, 116,934; in the whole Church, including the mission fields, 130,447; of members received on profession, 7,158; of baptisms, 4,163 of infants and 1,546 of adults; of Sabbath-schools, 1,208, with 12,989 officers and teachers and 120,032 scholars, returning contributions of \$109,446; of Young People's Societies, 1,057, with 41,966 members. Amounts of contributions in America: For salaries of ministers, \$616,789; for congregational purposes, \$627,282; for the boards, \$343,411; for general purposes, \$139,398; total for America, according to the footing of the table, \$1,726,880; total for the whole Church, \$1,751,291; average per member in America, \$14.89; average salary of pastors in America, \$1,009.

At the forty-second annual meeting of the General Committee of Home Missions, May 15 to 22, applications for aid were presented from 241 stations, asking for \$104,413. Appropriations of \$100,550 were made. Investigation was directed to be made with reference to work among the mountain whites of the South.

The permanent fund of the Board of Ministerial Relief amounted to \$116,090, an increase of \$9,890 accruing from a bequest. Sixty beneficiaries had been aided. A special provision has been made for ministers who have reached the age of seventy years and have been engaged in the pastorate thirty years or more.

The report of the Woman's Board of Missions mentioned extension of its work in India and Egypt. The year's receipts of the board had been \$75,805. The sum of \$39,618 had been contributed as thank-offerings.

The forty-third General Assembly met at Des Moines, Iowa, May 22. The Rev. J. A. Thompson, D.D., president of Tarkio College, was chosen moderator. The Committee on the Fifteenth Article of the Testimony, on secret, oath-bound societies, reported that they had not found any extended desire for a change in the article. All that was required was a deliverance by the Assembly as to the proper application of the article in its administration, giving to sessions a certain degree of discretion, as in the administration of other parts of the standards. The minute adopted by the Assembly recites that "in view of the existing diversity in the interpretation of the fifteenth article of the Testimony and in the application of it by sessions in the admission of members of secret orders, and in view of the general multiplication of these orders, and of their diversity in purpose and character, the Assembly adopts the following as expressive of the mind of the Church on the subject. The fifteenth article of the Testimony continues to express the general sentiment of the Church, and is hereby affirmed. Members of the Church of Christ ought not to have fellowship in associations which bind their members by oath or affirmation to obey obligations, and to immoral secrecy, or which establish a fraternal fellowship among men subversive of the unity of the body of Christ. It is especially obligatory upon Christians to stand aloof from the societies which by their moral teachings and religious ritual foster a belief in the salvability of men apart from the mediation of Christ. We condemn such organizations as most dishonoring to our Lord and injurious to men, and persons who, with knowledge of the truth concerning them, wilfully adhere to such associations shall not be received into church-membership. All such societies are included in the phrase of the Testimony "inconsistent with the genius and spirit of Christianity." The entire contents and bearing of the article should be emphasized in the pulpit teaching, and

the Testimony faithfully maintained by all. The article is not to be construed so as to exclude from the Church the membership of all such societies as are not bound by oath or affirmation or do not pledge to secrecy things unknown, or inculcate a Christian religion. In the administration of this article, as of others of the Testimony, sessions possess the right to exercise a wise discretion in dealing with such cases as may arise on their merits and in such a way as may best promote the glory of God and the edification of the Church. It is supposed that sessions are composed of men of understanding, and that they are acquainted with the principles and are faithful to the trust committed to them as officers of the Church. They may safely be trusted in the exercise of this power as courts of the Church, being, of course, responsible for the manner in which they exercise this discretion." The overture to repeal that part of the Confession of Faith referring to marriage with a deceased wife's sister having received a majority of the votes of the presbyteries, the Assembly declared the Confession so amended. It was represented in the report of the Freedmen's missions that the increase by profession of faith had been more than three times as large as in the previous year; that the liberality of the people was increasing and they were making commendable efforts toward self-support, the average per member having been one-third larger than then. The Assembly, holding that evangelization was more vital than secular education, approved the policy of establishing churches among these people; it further instructed the board to embody in its report a statistical table of the educational work among them. In the matter of foreign missions, the Sudan was constituted a distinct mission, and \$5,075 were appropriated for its use in the present year; steps were authorized for the incorporation of Asyut College, Egypt, and the Gordon Mission College in Rawal Pindi, with power to confer academic degrees; and the board was authorized to commission teachers and other helpers as missionaries, but without the right of membership in the Missionary Association. A minute of the Assembly on the subject of increasing the contributions of the Church recommended that each presbytery, at its next meeting, hold a conference on the work of the several boards and adopt a plan for increasing the interest of congregations in it; that pastors and sessions arrange a service in the interest of this work once a quarter during the coming year; that they make a special effort to secure from each member a contribution, and make a proportionate distribution of the funds according to the appropriations of the General Assembly; that the boards, acting jointly, prepare a program to be suggested for the services to be held by congregations; and that work be begun at once, and earnestly continued through the year. The subject of making desired changes in the membership covenant was referred to a special committee to report to the next meeting of the General Assembly.

IV. Reformed Presbyterian Church Synod.—The statistical tables of this body for 1901 give it 112 congregations, 10 mission stations, 125 ministers, 20 licentiates, 7 theological students, 9,733 communicants, 10,489 pupils in Sabbath-schools, and 2,264 members of Young People's Societies.

The Synod met in Pittsburg, Pa., May 29. The Rev. D. C. Martin, of Pittsburg, was chosen moderator. Reports were made by the Boards of Home and Foreign Missions and Church Extension recording advance during the year. The interest-bearing funds of the Church amounted to

\$295,226, and were invested at 5 per cent. Resolutions were passed condemning the liquor traffic and the tobacco habit, and exhorting the disuse of tobacco by members of the Church, urging the President and Congress to secure improved moral conditions in districts under military rule, approving the effort to secure uniformity in the divorce laws throughout the United States; insisting upon regard for the sanctity of the Sabbath, and advising members to refuse to attend the Pan-American Exhibition at Buffalo, N. Y., because of its being open on Sunday; and condemning labor organizations as commonly conducted, but expressing sympathy with efforts to improve the condition of the working men. On the subject of psalmody the Synod advised "the ministers and members of the witnessing Church" to maintain "unflinching fidelity, as in the past, to the divine injunction given by the Redeemer himself to the Church of Thyatira—'That which ye have hold fast till I come.'" Delegates were appointed to attend the Psalmody Convention in Ireland in the summer of 1902. A committee was appointed to formulate a plan for the more equitable distribution of home mission and church extension funds to churches applying for aid. A petition to Congress was adopted asking for the repeal of the Chinese exclusion laws. In it the Synod expressed acquiescence in the exceptions made in the emigration laws with reference to paupers, persons afflicted with infectious diseases, anarchists, and all who are hostile to the Government, but pronounced it "exceedingly unjust and wrong to discriminate against the people of any one nation alone." A delegate from the Christian Reformed Church in America was received, and a committee was appointed to confer with a like committee of that body, with reference to closer relations. A report was brought in to the effect that holding office under the United States, where no immoral oath is required, does not in itself constitute a sin, but warning the Church that discharging the duties of the office might be sinful. Action on this paper was deferred till the next year. Appropriations of \$39,500 were made for mission work.

V. Cumberland Presbyterian Church.—The following is a summary of the statistics of this Church as they were reported to the General Assembly in May, 1901: Number of synods, 16; of presbyteries, 122; of ministers, 1,586; of licentiates, 237; of candidates, 231; of churches, 2,963; of elders, 10,495; of deacons, 4,136; of members, 182,449; of additions during the year by examination, 9,022; of members of Sunday-schools, 104,996; of baptisms during the year, 5,956 of adults and 1,470 of infants; value of church property, \$4,267,561. Amount of contributions: For home missions, \$8,557; for special missions, \$5,078; for church erection, \$2,849; for foreign missions, \$14,445; for the Woman's Board of Missions, \$19,434; for education, \$11,788; for ministerial relief, \$10,939; for local and presbyterial missions, \$7,863; for the Children's Day fund, \$3,024; for synodical church extension, \$20,278; for building and repairing churches, etc., \$243,923; for pastoral support, \$389,695; miscellaneous contributions, \$89,630.

The Board of Ministerial Relief had received \$10,940, of which \$2,220 had been added to the Permanent fund, and \$8,720 had been available for the aid of 56 ministers and 49 widows of ministers. The Board of Publication returned \$5,107 net profits and nearly \$1,000 received by gift and otherwise. From these moneys \$3,769 had been applied to the reduction of the debt, which had been further diminished by the proceeds from the

sale of property \$8,000, while the assets had been increased by about \$2,300.

The Committee on Systematic Benevolence reported that interest was growing.

The report of the Educational Society represented that about 200 of the 505 probationers in the Church had been in school during a part or all of the time, while about 135 had been assisted by loan or gift through the society or by particular congregations and individuals. A home course of study recommended by the Assembly six years before for probationers who could not go to school had been generally adopted and had become a means of elevating the standard for ordination. The total disbursements had been \$11,146. The permanent fund amounted to \$8,000. Accounts were given of the condition of four colleges and universities, the Theological Seminary at Lebanon, Tenn., and six other institutions. Colored schools at Huntsville, Ala., and Newbern, Tenn., had been aided.

Reports were made to the Woman's Board of Missions of synodal and presbyterial work, the mountain mission and school at Hopewell, N. C., the Colegio Morelos, at Aguas Calientes, Mexico, and mission work among the Chinese at San Francisco and Merced, Cal.

The Board of Missions reported estimates for the ensuing year of \$11,000 for home and \$17,000 for foreign missions, involving the need of an increase of \$6,000 in the receipts. Accounts were given of the foreign mission work in China, Japan, and Mexico, and of home mission work at sixteen stations. A Chinese missionary was laboring among the Chinese in the Pacific Synod. Thirteen church extension workers were employed by synods. The receipts for church erection had been \$2,849. The sum of \$5,461 had been returned from loans during the year, while \$2,575 had been loaned to churches. The total missionary receipts for the year had been \$85,550, of which \$19,779 had come through the Woman's Board.

The seventy-first General Assembly met at West Point, Miss., May 16. The Rev. E. E. Morris was chosen moderator. Miss Vianna Woosley appearing as a commissioner from Leitchfield, formerly Nolin, Presbytery, the right of a woman to a seat in the General Assembly was again brought into question. The Assembly decided: "*Whereas*, Some presbyteries have several times in the past sent women as ruling elders to represent them in the Assembly; *And whereas*, This question has tended to disturb the peace of the Church, which peace we have pledged to study; *And whereas*, The General Assembly has declared, and does declare, such elders unconstitutional representatives; *Resolved*, That the presbyteries be instructed not to send women to represent them in the future; *Resolved*, That this shall not unseat nor lead to the unseating or expelling of any commissioner of this present Assembly." A protest was entered against this action, based on the ground that the Assembly had declared it unconstitutional for presbyteries to send women elders as commissioners, and at the same time had conceded Miss Woosley's right to a seat, thus making a conflict deliverance. A proposed constitutional amendment providing for rotation in the office of ruling elder and deacon, having been approved by the presbyteries, was ratified. A ruling of the previous General Assembly practically demitting ministers who have remained out of presbyterial membership more than three years was revoked. A report on divorce was adopted, declaring that according to the Confession of Faith the marriage relation should not be interrupted except upon Scriptural grounds, and that according to Scrip-

tural example and injunction conjugal infidelity is the only cause for the granting of divorce. The report on the theological seminaries embodied a historical citing from the records of all the transactions in relation to the seminary from the beginning, the whole tending to show and leading to the conclusion that "the General Assembly in founding the Theological Seminary designed to control the same." In the light of this statement, the Assembly affirmed that the seminary was its property and under its control, and decided that due provision be made for its management, so as to make it, as it was designed to be, the seminary for the whole Church; that the Board of Trustees should be composed of members of the Cumberland Presbyterian Church; that the principle of rotation as applied to the other boards should prevail in the terms of service of the trustees; that all funds for the seminary should be received and held by the trustees for the Assembly; and that the wording of charters and other documents relating to the seminary should be made to conform to the claim of the Assembly to its control. The Committee on Centennial Endowment reported that \$203,000 had been secured for the endowment of Cumberland, Trinity, and Lincoln Universities, in addition to which a new university, called, after its benefactor, James Miliken University, had been founded.

The General Assembly of the Colored Cumberland Presbyterian Church met at Pratt City, Ala., in May. The Rev. E. J. Simpson was chosen moderator. The reports of the several committees testified to a growing interest among the membership of the Church in the causes of missions, education, and church extension.

VI. Presbyterian Church in Canada.—The statistical reports of this Church, made to the General Assembly in June, showed that almost 10,000 members had been added during the year on profession of faith, and that 71 churches and 27 mansees had been erected. The total contributions of the Church for all purposes were \$2,601,451, of which sum \$347,754 were given to the educational, missionary, and benevolent work. Counting interest on receipts from investments and the contributions for the Century fund, the whole amount of receipts would considerably exceed \$500,000.

The twenty-seventh General Assembly met in Ottawa June 12. The Rev. Dr. Robert H. Warden was chosen moderator. The Committee of the Century Fund reported that the \$1,000,000 aimed at had been secured, and such a sum in addition that it was proposed to make the contribution one of \$1,500,000. A check for \$10,000 had been sent by Lord Strathcona, and a contribution of \$20,000 was expected to be given by Sir Donald Smith to the Aged and Infirm Ministers' fund as soon as certain conditions were complied with. A plan was presented embodying the details for the management of the several departments of the fund. Measures were further recommended and approved by the Assembly for marking the opening of the century by a direct advance movement in spiritual life and religious activity. The condition of the Aged and Infirm Ministers' and the Widows' and Orphans' funds was made the subject of special conferences of the elders members of the Assembly, whose recommendations, adopted by the Assembly, included the giving of greater prominence to the two funds before the Church, and the introduction of business principles into their administration. The home missions were represented as in a state of rapid growth, extending through all the Northwestern States and Territories and calling for constant accessions of

working force; and the estimates for what would be required in the ensuing year considerably exceeded the nearly \$90,000 that had been expended upon them during the past year. An assistant superintendent was appointed. The Board of French Evangelization reported concerning 85 preaching stations, 12 colportage districts, and 16 mission schools. The receipts for foreign missions had been \$35,298 for the Committee of the Eastern Section, and \$105,513 for the Committee of the Western Section. An additional grant was made by the Assembly for educational work (the college) at Indore, India. Notice was taken of the death of Dr. G. L. MacKay, the pioneer missionary of Formosa. Applications for the relaxation of terms of ministerial qualification in particular cases where special needs were to be met, and for the enactment of a uniform minimum standard of qualification for persons who take part in catechetical work in the mission fields, were referred to special commissioners for consideration. Special provisions were made, in view of extraordinary cases seeming to justify such legislation, for giving limited ministerial privileges for not less than one year nor more than three years to persons appointed by the Home Mission Committee with the consent of the presbyteries in which they are to labor. A scheme for the establishment of reading-camps among lumbermen was approved. The Committee on Aids to Public Worship in New Fields was instructed to complete its volume and submit it to the next General Assembly for approval. A proposal for the appointment of an executive for the whole Church was sent down to the presbyteries as a remit.

VII. Presbyterian Church in Mexico.—The Synod of the Presbyterian Church of Mexico was formally organized as an independent branch of the Presbyterian Church July 8. It is composed of the presbyteries of Zacatecas, the city of Mexico, and the Gulf of Mexico, comprising the churches of the Northern Presbyterian Mission, and of Tamaulipas, of the Southern Presbyterian Mission. Systematic Presbyterian mission work in Mexico was begun in 1872, when the Northern Church sent its first missionaries. The Southern Church followed in 1873. The labors of the missionaries have been very successful in gathering converts and training a native ministry. The expediency of consolidating bodies and placing them upon a footing independent of foreign influence had been recognized for some time, and preparations had been gradually making for it. The Northern and Southern General Assemblies of 1901 gave their sanction to the movement. The meetings of organization were held in the city of Mexico. The preliminary meeting, July 6, was presided over by the Rev. Thomas F. Wallace, D. D., of Zacatecas, the oldest of the missionaries, and the address of welcome to the members of the Synod was made by Rev. A. Morales, while responses were made by representatives of the general assemblies and other persons. The formal organization of the Synod, July 8, was preceded by a discussion of its constituent elements, when it was unanimously determined that the missionaries should be members of the body, on the same footing as the native ministers. The communications of the two general assemblies and the action of the presbyteries approving the organization were read, and the Westminster standards and the Form of Government were accepted as the faith and order of the Church. The Rev. Arcadio Morales, pastor of the Church of the Divine Saviour, city of Mexico, was chosen president of the Synod. Fraternal delegates were ap-

pointed to the general assembly in the United States.

VIII. Church of Scotland.—The number of communicants on the rolls of the Church at the end of December, 1900, was 601,629, an increase of 5,517; and the whole number that communicated at least once during the year was 474,929. The number of baptisms was 30,247, and the number admitted to communion for the first time was 26,054. According to the annual report of Christian liberality, the contributions during the year amounted to £444,053, an increase from the previous year of £21,730; of seat rents, £71,378; of ordinary church-door collections, £113,382; of collections for parish or local missions, £17,762; for buildings, £7,811; for general church objects, £93,728. The legacies amounted to £10,583.

The General Assembly met in Edinburgh, May 21. The retiring moderator, the Rev. Dr. Norman Macleod, in his retiring address, after referring to the consummation of the union of the free churches, said that he saw no reason why an end so eminently patriotic and Christian as that of a larger presbyterian union might not be attained. To that end reasonable concessions on the one hand and on the other might be made, but in such a manner as would consume all that was deemed essential to the present constitution of this Church as the national Church of the ancient Kingdom of Scotland. If, however, there might not be an incorporating union, there might, at all events, be a greater amount of harmonious co-operation. The Rev. Dr. M. Mitchell, of Leith, was chosen moderator. A motion was adopted inviting conferences in favor of union, with the reservation that this Church steadfastly adhered "to the principle of the national recognition of religion, and of the conservation for religious uses of the patrimony of the Church." A deputation consisting of representatives of the United Free, the Episcopal, and the Established Churches, asking that a day of prayer in behalf of Christian unity be designated, was received by the Assembly, and it resolved to take whatever steps were necessary to observe such a day. A committee appointed by the previous General Assembly to consider what power, if any, the Assembly possessed to alter the Confession of Faith, brought in three reports, of which the "original report," declaring that the Church has no power to modify, abridge, or extend the Confession of Faith, and that that can be done only by Parliament, was adopted, with an addendum declaring that the Assembly would proceed no further, though it desired to enlarge rather than curtail liberty.

IX. United Free Church of Scotland.—The number of members of this Church as reported to the General Assembly in May (for Dec. 31, 1900) was 488,795, against 495,174 in the Free and the United Presbyterian Churches together on the 31st day of December, 1899. While the Lowland synods had increased from 457,531 to 458,194, the Highland synods had fallen from 37,643 to 30,601. Ninety-eight congregations which had in the previous year returned a membership of 8,364 this year made no return.

The report of the Finance Committee to the General Assembly dealt with the expenditure of the Free Church for nine months and of the United Presbyterian Church for the whole year. The total income in the Free Church for the period designated, excluding certain funds locally administered, amounted to £552,355; that of the United Presbyterian Church to £96,289; and the invested funds were £293,979.

The General Assembly met in Edinburgh May

21. The Rev. Thomas Kennedy was chosen moderator, and in his address spoke in general terms of the results of the union. The Committee on Union presented a short report, which referred principally to the efforts made to unite congregations in localities where that policy might be expedient. The report on the conditions in the Highlands, where many members and congregations of the Free Church refused to be bound by the union, represented that the union had aroused feelings of thankfulness and hope; but undoubtedly in certain parishes strife and division had gone so far that the people had been assembling in hostile camps. It had always been thought desirable to minimize the evils connected with such a state of things by avoiding needless agitation. At the same time it was impossible to leave unsupported and uncared for the ministers of the United Free Church and the people who desired to have Gospel ministrations at their hands. A report from the Committee on Romanism and Ritualism commented on certain ecclesiastical events of the year. A deputation of representatives of the Established Church, the Episcopal Church, and the United Free Church waited upon the Assembly in behalf of the appointment of a day of prayer for unity. The subject was referred to a committee, the report of which as adopted by the Assembly said that any attainable approach to a larger measure of organic unity in the country would best take place by mutual recognition, by cooperation in good works, and by union of churches which are akin to one another in faith and constitution. The report on Church and state affirmed that the termination of the statutory convention now maintained between the state and the Church of Scotland seemed to be a necessary step toward relations between churches in Scotland which were very widely desired.

Judgment was given by Lord Low at Edinburgh, Aug. 9, in the suit brought in behalf of the minority of the Free Church to be declared entitled to possession of its funds and property. The arguments of the plaintiffs were reviewed in the decision. To their plea that the constitution of the Free Church had been violated by the union, the court replied that in its opinion the union did not involve the giving up of any doctrine or principle which formed any part of the essential or fundamental portion of the creed of the Free Church, and that although the Establishment principle was an essential principle of the Free Church at the time of the disruption in 1843, it had become unessential. The second plea, that the union was incompetent in the face of the dissentient minority, was characterized as absurd. Concerning the claim of the plaintiffs to participation in the funds and property of the Free Church, the court held that the minority either constituted the Free Church or were entirely separated from it. It took the view that they were separated, and consequently had no right to participate.

X. Free Church of Scotland.—The General Assembly, representing those ministers and members of the Free Church of Scotland who refused to enter the union with the United Presbyterian Church (see the *Annual Cyclopædia for 1900*) met in Edinburgh, May 21. The Rev. J. D. McCulloch, of Glasgow, was chosen moderator. In nominating him to the Assembly, the retiring moderator, the Rev. Colin A. Bannatyne, asserted that the Assembly met in circumstances more prosperous and full of hope than the most sanguine could have anticipated six months before. The business of the Assembly consisted mainly in the reorgani-

zation of the concerns and committees of the Church, which had been disorganized, so far as this body was concerned, by the going over of those who had chiefly managed them, into the union. A resolution was passed denouncing the "Deceased Wife's Sister bill," the adoption of which, it was declared, would constitute "an assault upon the requirements of divine law and the Confession of Faith." A committee report stated that the strength of the Church was in the Gaelic-speaking part of Scotland. Twenty-five ministers were in charges, but there were several vacancies. The income of the committee had been £283, an amount which would be fully required to settle the accounts.

At the meeting of the Commission of this Church, held at Edinburgh, March 6, it appeared that 92 congregations in at least 11 presbyteries, 26 ministers, and 18 regular paid agents, with 50 preaching stations, adhered to the principles of the protest. Twenty-five applications for employment had been received.

XI. Presbyterian Church in England.—The statistical reports of this Church submitted to the Synod of 1901 show that it had 321 congregations, 76,111 church-members (an increase of 1,570), with 166,391 sittings in the churches, and church buildings having an estimated value of £2,004,450, less indebtedness of £101,659. The total income of the Church had been £298,711, against £306,847 in the previous year. The aggregate amount paid for stipends was £98,848, an average of about £300 per minister. Other items reported were 80,983 pupils in Sunday-schools (a falling off of about 3,000), 14,664 teachers in Sunday-schools, district visitors, and members of Dorcas Societies, and 6,614 members of Young Men's Societies.

The contributions for foreign missions amounted to £35,363, showing an increase of £6,000 over the previous year. There were now in the field 20 ministerial missionaries, 13 doctors, 4 missionary teachers, 24 Women's Missionary Association agents, and 4 woman doctors, besides 27 wives of missionaries; with native pastors and evangelists. The native members numbered 7,157, showing an increase of 419. Notwithstanding the outbreak in China, the work had made a distinct advance.

The Synod met in London, April 29. The Rev. James Christie was chosen moderator, and spoke in his address of the coronation oath, the sanctions of which he thought would be strengthened "by expunging the acerbities of an age of fierce antagonisms," Presbyterian union, and the forward movement in the Free Churches. The Synod expressed thankfulness that the Church Building fund of £50,000 had been successfully raised, and instructed the Home Mission Committee to bring up rules to the next Synod for the establishment of a permanent Church Building fund. Instead of appointing a stated evangelist, it was decided to set apart three ministers to carry on evangelistic work during a part of the year; and "inasmuch as the Church's ordinary methods of work were not fully suited to reach the poorer classes of the people," a special committee was appointed to consider respecting provision for undertaking work on lines which have been found successful in other churches.

XII. Welsh Calvinistic Methodist Church.—The statistical reports of this Church, made to the General Assembly in May, showed that it had 1,572 chapels, with 879 other buildings, apart from chapel houses and manse, with 158,114 communicants, showing an increase of 2,056, and 319,261 hearers. The aggregate of collections for the past year had been £283,903.

The General Assembly met at Aberystwith, May 21. The Rev. T. J. Wheldon was chosen moderator. It appeared from the reports that of the 18 new churches which had been planted during the year, 11 were English. Welsh Wales had been abundantly supplied, and it was urged that the home missionary efforts of the Connection must now be brought to bear upon English Wales. The Welsh churches had increased 1.04 per cent. during the year, and the English churches 3.58 per cent. The committee having the care of provision for the spiritual wants of Welsh people in other countries reported that there were 5,000 Welsh in Australia, and that while 4,000 persons left Wales every year for London, the Welsh churches of all denominations in the metropolis could account for no more than 1,000 of this number. The foreign mission report showed an increase of 413 communicants in the Indian mission (Khassia, Jaintia, and Sylhet), with 15,048 adherents, 19,335 hearers, and 13,878 members of Sunday-schools, while the collections in the native churches amounted to £1,440. The native churches had started a century collection. Another mission of the denomination is in Brittany. The receipts for missions from all sources had been £7,978, and the expenditures £13,397. The report on temperance called attention to laxity in practise by many members of the Church. A handbook containing all the connectional rules was ordered prepared for publication.

XIII. Presbyterian Church of Australia.—The Presbyterian Church of Australia, formed by the organic union of the Presbyterian Churches of the six states of the commonwealth, was constituted, and the first General Assembly met July 24. The drawing together of the Presbyterian churches in the Australasian colonies began as far back as 1865, when the three branches of Presbyterianism in New South Wales united. The movement that has culminated in the present general union began about twenty years ago, when a federation of the churches was established, and a Federal Assembly was constituted, which has met regularly since. But this was a body without powers. In the meantime the disposition to unite organically has been developed, and the steps necessary to effect a legal union have been taken. Among them was the obtaining of legislation in the several states, permitting and confirming the adjustments of property which would have to be made. The Federal Assembly met for the last time on the evening of the day preceding the meeting of the United Assembly, July 23. The final report of the Committee on Union was submitted by the Rev. John Meiklejohn, setting forth that the scheme of union had been unanimously agreed to by all the state assemblies, and that the necessary parliamentary legislation had been obtained in all the states except West Australia, which would also shortly pass the necessary act. The moderators of each of the several local assemblies in turn made a declaration in behalf of their assemblies of the adhesion of those bodies to the deed of union, and of their authorization to affix their official signatures to the paper. The balance-sheet was read, showing a handsome balance, which was passed on to the United Church. After the completion of these acts the Federal Assembly was declared dissolved. At the meeting of the new General Assembly the Rev. James Cameron, moderator of the General Assembly of the Presbyterian Church of New South Wales, was appointed temporary chairman. The basis and articles of union were adopted, and the deed of union was signed by all the moderators, when the union was declared consummated, and

the present meeting was constituted the first General Assembly of the new Church. The Rev. John Meiklejohn, of Melbourne, was chosen moderator. At an evening public meeting held at the same time congratulatory greetings were received from the evangelical churches of Australia and New Zealand, and the Presbyterian Churches of Scotland and England. A resolution was adopted expressing a desire for closer relations with other evangelical churches, and inviting steps toward a federation.

The union embraces the Presbyterian Churches of the six states of Australia, viz., New South Wales, Victoria, Queensland, South Australia, West Australia, and Tasmania. The basis of union consists of the Westminster Confession with an annexed declaratory statement, and may be amended upon agreement of a majority of the local assemblies, three-fifths of the presbyteries, and three-fifths of the members of the General Assembly. The articles of agreement, containing the rest of the constitution of the Church, can be altered or added to from time to time with the consent of simple majorities of the local assemblies, the presbyteries, and the General Assembly.

XIV. Presbyterian Churches in New Zealand.—The Presbyterian churches of New Zealand have not entered the Australian union. The two bodies, however—the Presbyterian Church of New Zealand and the Presbyterian Church of Otago—have taken steps toward forming a union of their own. A bill dealing with their property has been introduced into the colonial Parliament, and the subject is under consideration by the assemblies.

PRINCE EDWARD ISLAND, a province of the Dominion of Canada; area, 2,133 square miles; population in 1901, 103,258. Capital, Charlottetown.

Government.—The ministry was practically a continuation of the Liberal Government formed by Hon. Frederick Peters in 1891, succeeded by that of the Hon. A. B. Warburton in October, 1897, and replaced by that of the Hon. Donald Farquharson, which was formed in August, 1898. The elections were held on Dec. 12, and the principal point at issue was the financial condition of the province. It was declared by the Opposition that the public debt had increased from \$500,000 to \$620,000 in the preceding year, and that revenue and expenditure would not meet. The result of the polling was that the Government's very slight majority was greatly increased, the new house showing 23 Liberals and 7 Conservatives. Mr. Gordon was reelected, and the Government was reorganized on Dec. 28, as follows: Prime Minister, Donald Farquharson; Attorney-General, Arthur Peters, K. C.; Provincial Secretary-Treasurer and Commissioner of Agriculture, Benjamin Rogers; Commissioner of Public Works, J. H. Cummiskey; ministers without office, J. W. Richards, Peter McNutt, George Forbes, R. C. McLeod, and M. McDonald.

On Jan. 29 the Hon. Benjamin Rogers, who had recently been appointed to the new post of Commissioner of Agriculture, was reelected to the Legislature over Mr. Dalton by 681 votes to 587.

Legislation.—The first session of the Legislature was opened on March 19 by Lieut.-Gov. P. A. McIntyre, after the members had taken the oath of allegiance to the King and Samuel Edward Reid had been elected Speaker. The speech from the throne contained the following passages: "I am pleased to state that this province has shared in the general prosperity of the Dominion, consequent to a great extent upon the abundant

crops and the fairly good prices obtained for our products.

"It is a matter of devout thanksgiving that in the long and arduous struggle in South Africa British arms have been victorious, and equal rights and freedom, as exemplified under British rule, is assured to the people of that country. We also feel proud of the manner in which our Canadian soldiers acquitted themselves; they have brought credit and honor to this country and raised Canada in the eyes of the world. We rejoice that so many of the brave heroes who went out from this province in the Canadian contingent have been spared to return to home and friends. Two of our young men have laid down their lives for Queen and country, and their memories will ever be cherished by every loyal subject in this their native province.

"The rapid growth and development of the various branches of agriculture upon which the prosperity of our province so largely depends suggests the propriety of giving every encouragement and assistance to our farmers by the dissemination of practical information with regard to the best methods of feeding and caring for stock, as well as the manufacture of dairy-products and fruit-culture. Some superior stock has lately been inspected by my Government which will, I am sure, be of great benefit to the country. At the beginning of the present year the Department of Agriculture was constituted and a commissioner appointed, whose efforts will no doubt result in advancing the agricultural interests of the province.

"A delegation of my Government recently visited Ottawa for the purpose of impressing upon the Federal Government the great necessity of supplementing our annual subsidy. A memorial fully setting forth the demands of the province in this particular respect was presented to the Cabinet, and the matter argued at length. There is good reason to hope that the result will be satisfactory.

"The working of our present road act, while entailing a heavy expenditure, has not proved satisfactory. A measure will be submitted for your consideration for the purpose of enacting some changes in the present method of keeping up our public highways."

The acts that were passed included the following:

A public roads act.

To ratify and confirm agreement between the governments of Canada and Prince Edward Island in respect of claims for non-fulfilment of the terms of union.

To amend an act to impose an income tax.

To amend an act passed in the sixty-third year of the reign of her late Majesty Queen Victoria entitled "An Act to impose certain taxes on certain companies and associations and brewers."

To impose taxes on certain life insurance agents.

For the encouragement of agriculture.

To amend an act prohibiting the sale of intoxicating liquor.

Respecting the use of tobacco by minors.

To prevent the destruction of woods, forests, and other property by fires.

An act to amend several acts relating to congregations of Presbyterians within this province, in connection with the Presbyterian Church in Canada.

Finances.—For several years the finances of the province had not been in a very satisfactory condition, and this fact was one of the issues in elections of 1900 as well as the supposed cause of the Premier's visit to Ottawa about the same

time. On April 12, 1901, the figures were published for the preceding year and showed receipts amounting to \$282,056 and ordinary expenditures of \$308,494, together with expenditures upon capital account of \$47,499. The receipts included the Dominion subsidy of \$181,931; the provincial land tax of \$28,245; the sale of debentures at a price bringing \$22,000; the taxes upon special interests—commercial travelers \$8,140, incorporated companies \$6,062, ferries \$5,706—amounting to \$19,908; the succession duties, \$3,641; and liquor-sellers' registration, \$4,700. The chief items of expenditure were \$16,595 upon the administration of justice; \$129,112 upon education; \$21,123 upon the Hospital for Insane; \$20,861 interest upon loans, etc.; \$7,443 upon legislation; \$7,469 upon the poorhouse and paupers; \$17,118 upon ferries; \$23,503 upon roads; and \$20,496 upon bridges. The expenditure of \$14,920 upon the Prince of Wales College and that of \$20,890 upon the Hospital for the Insane were the principal charges to capital account. At the same date the Premier stated that the debts of the provincial Government included \$112,775 to the Royal Bank of Canada, \$69,411 to the Bank of Nova Scotia, and \$10,396 to the Merchants' Bank of Prince Edward Island. The loans account stood at \$170,858, and the amount due on debentures at \$222,263. This made a total provincial indebtedness of \$585,703.

On May 8 the Hon. Mr. Farquharson delivered his budget statement. He announced that the provincial claims upon the Dominion had at last been recognized, and \$30,000 a year given as compensation for the non-fulfilment of the confederation compact regarding steam communication with the mainland. He then referred to some of the items of expenditure recorded above. The new building for the Prince of Wales College was costing \$38,000; the annex to the Insane Asylum, when finished, would cost about \$50,000. In other directions they had been doing good work. "Our steam service on the ferry routes is more efficient than it was under our friends opposite. The boats and wharves are better kept up, and the cost is \$10,000 a year less. We have introduced 33 road machines, which do efficient work, and have ordered 2 more. We have built some steel bridges, and a number of cedar and stone structures, all over the province." The expenditure on education and on the Hospital for the Insane was yearly increasing, but he did not see how this could be avoided. He defended the principle of issuing debentures for the construction of public works, and stated that the \$35,000 worth sold for building the college and paying 3½ per cent. for thirty years had brought more than their face value. In the past year another \$22,000 has been sold. Turning to the receipts, he said that no other country had so low a succession tax, and that the liquor-sellers' registration would soon cease. The land and income taxes were slow in collection. For the ensuing or current year he estimated the receipts at \$314,581, including \$181,931 from the Dominion, \$30,000 from the land tax, \$16,000 from road revenue, and \$15,000 from the additional (half-year) Dominion subsidy. The estimated expenditure was \$294,127 on general account and \$20,147 on capital account—a total of \$314,274.

The Opposition leader followed, and figured out a deficit in the current year of \$42,000. He based this upon the probable falling off in land-tax returns, the increased cost of roads, and the loss of liquor licenses. The Prince of Wales College, Mr. Gordon thought, was costing a little too much, and the cause of the increased insanity in the province should be investigated.

Tobacco Legislation.—By the terms of a measure introduced in the Legislature, any person who directly or indirectly sells, gives, or furnishes cigarettes, cigars, or tobacco in any form, to a minor under sixteen years of age is subject by summary conviction to a penalty not exceeding \$25, with or without costs, or to imprisonment with or without hard labor, for a term not exceeding thirty days, or to both fine and imprisonment, at the discretion of the convicting magistrate. The youth who is found smoking or possessing cigarettes or tobacco was also made liable to a penalty not exceeding \$5, or to imprisonment for a period not exceeding seven days. The subject was debated in the house on March 25, when Mr. J. F. Whear declared that the use of tobacco was increasing among the young, and expressed his strong belief as to its detrimental effect upon the mental faculties and nervous system. Mr. Gordon thought the law could not be enforced, and would tend to encourage smoking rather than restrict it. A. J. McDonald considered the whole thing a farce and an injury to trade. Mr. Hughes was afraid of the influence this legislation would have upon the tobacco trade, when profits were now very small. He was in the drug business, and could testify to the increase of the habit of smoking cigarettes. The measure finally passed and became law.

Agriculture.—At a meeting of the Charlottetown Board of Trade on March 7, 1901, a resolution was passed recapitulating the dependence of the province upon its agricultural resources; the suitability of the soil and climate for raising the best kind of beets, as demonstrated by experiment and analysis; the fact that a company had been formed for the development of this industry and had announced its intention to establish a factory in the island, provided the Federal Government would pay them a bonus of 1 cent a pound; the benefits which would accrue to the farmers, laborers, and business men from such a policy as well as from the expansion of trade, and the consequent increase in transportation over the island railway. It was therefore resolved: "That in view of securing to the island the establishment of a beet-sugar factory, we urge upon the Dominion Government the necessity of a bounty of 1 cent a pound for a term of three years on the beet-sugar manufactured within this province." But the Federal Government would not go further than the admission of machinery free.

On April 4 the Hon. Mr. Rogers, Commissioner of Agriculture, presented the following motion to the Legislature: "Resolved, that it is desirable to introduce a bill to provide for the appointment of a professor of agriculture, with annual salary to be fixed by the Lieutenant-Governor in Council, and for the organization of agricultural societies throughout the province, and for the encouragement of the various branches of the farming industry of this island by an annual grant of public money to be distributed to such societies in proportion to the number of their paying members." Each agricultural society must have a membership of 50, paying a fee of 50 cents, before the Government grant of \$50 was paid. Their estimate was that 39 societies would ask for this grant, involving an expenditure of \$1,950. The Professor of Agriculture had already been appointed at the Prince of Wales College, and his duties would be the giving of instruction in the college, management of the Government farm, lecturing throughout the province, the improvement of stock-breeding, and filling the post of secretary of the department.

Meanwhile, in March, official statistics were

made public of the work done by the cheese and butter factories of 1900. The figures showed 59,901,455 pounds of milk received; 1,431,539 pounds of cheese made, \$445,663 its gross value of the cheese; 578,726 pounds of butter made, and \$123,052 as its gross value.

Road System.—Perhaps the most important legislation of the session was that relating to public roads. On April 15 the Hon. Mr. Cummiskey moved a resolution declaring that it was desirable to repeal the public road act of 1879, and to provide for the carrying out of the system in a more efficient manner. He declared that people throughout the province were crying out for a change. He gave statistics of expenditure upon the roads—not including the value of statute labor—during the Conservative rule of 1881-90 as having been \$236,728, or an average of \$23,672 a year. Under Liberal government, between 1891 and 1900, the amount was \$238,489, or an average of \$23,848. In place of statute labor, where the indolent man either threw the work upon his neighbor or made himself and his neighbors suffer from bad roads, it was proposed to impose a small tax on men and horses now subject to perform statute labor. Contracts for road construction and repairing were to be thrown open to public tender. Mr. Cummiskey estimated the number of men subject to the new tax at 15,766, and the horses at 20,055. The proposed levy of 75 cents on the former would bring a revenue of \$11,824, and on the latter of \$5,013. The cost of operating the roads under the new system, by which road machines were to be used wherever practicable, he placed at \$20,860, while the average expenditure of recent years had been \$23,848 without including statute labor. One machine and 2 men could do the work of 50 men in the ordinary way.

As finally passed, the measure defined with care the duties of road inspectors, contractors, overseers, justices of the peace, and stipendiary magistrates.

Education.—The annual report of the Chief Superintendent of Education was issued in April, 1901. The number of schools was given as 468, the school districts as 471, and the school departments as 586. There were no schools vacant during the year. The number of teachers employed was 586, of whom 314 were men and 272 women. There was an increase of 13 woman teachers and a decrease of 9 man teachers over 1899. The number of pupils enrolled was 21,289, a decrease of 261 from the previous year, and the smallest number since 1882. The percentage of attendance showed an increase. The expenditure by the Government was \$129,113, the largest in the fifteen years with the exception of 1898. The amounts voted at school meetings was \$34,055. The average salaries of men showed very little change, and included \$774 as the highest down to \$180 as the lowest. The salaries of women ranged from \$357 to \$130. The average time spent in teaching was only four years, and as soon as teachers could see their way to "law, medicine, or husbands" they left the profession. The superintendent summed up with the statement that the close of the year 1900 marked "the highest point yet reached" in the educational progress of the province.

PRINTING, PROGRESS OF, IN RECENT YEARS. Nearly all the improvements that have been made in printing belong to the nineteenth century. In 1800 there were printers in all the large cities of the world, but they were using practically the same rude tools and slow methods that marked the work of Gutenberg, Caxton, and

Manutius. To-day there are single printing-establishments that could turn out as great a volume of printing in a week or a year as did all the printers of the globe in 1800. The industry now ranks as one of three or four that are the greatest in the world. Accurate statistics can not as yet be produced to show this, but the conclusion may be deduced from reasoning and observation. The United States census returns for 1880 show printing and publishing to be the seventh industry in value of products reported, and that this product had more than trebled during the preceding ten years; the rate of growth was greater than that of any other large industry. If the rates of growth for the larger industries of the United States were maintained in the last decade as in the previous, then the printing industry should rank first to-day. In any case, it is reasonably certain that printing and publishing ranks with foundry and machine-shops, iron and steel manufactories, and men's clothing as one of the four greatest industries. There are more than 1,000 printing-offices in New York city alone, and there are about 25,000 newspaper offices, and nearly as many job-printing offices, in the United States and Canada. The total number of printing-establishments of all sorts in the world is believed to be nearly 100,000.

It has been estimated that the newspapers and periodicals of the United States and Canada circulate nearly 4,000,000,000 copies annually, and that the remainder of the world's issue might double these figures; but, as newspapers are prone to overstate the facts, doubtless the truth is well within these figures. Observation indicates that the volume of commercial printing is not greatly below the volume of newspaper-printing.

The quality of printing has increased strikingly, but the cheapening of the work is more remarkable. Forty to sixty years ago 4-page newspapers were sold in the United States for 5 cents, which represented about one-twenty-fifth part of a workman's daily earnings. Now newspapers of 16 pages are sold at 1 cent, and the workman's earnings have doubled, so that the twenty-fifth part (10 cents), will buy 160 pages of newspapers, or forty times as much in bulk. The reduction in the cost of books is almost as great. Neatly bound volumes are now commonly sold at 25 cents each, whereas at the close of the civil war books were mostly quoted at \$2 or more. This reduction in cost has been brought about largely by the following agencies: 1. Rotary printing-machines, operable at much higher speeds than the flat-bed reciprocating presses; 2, the use of paper in the roll, instead of in single sheets that had to be fed in one at a time by hand; 3, the substitution of pulped wood instead of the more costly rags as a material for making paper; 4, the introduction of composing-machines, each of which performs the labor of five to six men; 5, the development of mechanical processes of engraving, making illustrations both better and cheaper than wood-engraving. To these might be added a very great number of minor causes, embodying the general improvement in all sorts of machinery and processes that enter into the production of printing.

Type-Founding.—The early printers cast their own types. Type-founding as a separate business began in England about two hundred years ago. The first permanent foundry in the United States was that of Binny & Ronaldson, established in Philadelphia in 1796. Their successors are in business there to-day as a branch of the American Type-Founders Company. The Bruces, of New York, did more to develop type-founding here

than any other concern. George Bruce accomplished a great deal in the way of systematizing sizes, styles, and bodies of type, and the firm of D. & G. Bruce originated and introduced a great many new faces. David Bruce, Jr., invented the type-casting machine, which came into use about 1840. In 1892 a majority of the type-founders of the United States organized as the American Type-Founders Company, and since that date have largely controlled the business, having branches in the principal cities, and being opposed by only a few large foundries.

About 1890 what is known as the "point system" of type-bodies came into general use. It was started in America by Marder, Luse & Co., in 1873, and proved so convenient that other foundries were eventually driven to its use. The system consists in making the widths of type-bodies—that is, non-technically, the thickness of the lines—all on a uniform scale. The smallest standard size of newspaper advertising type (formerly called agate, and differing a little in size with almost every foundry manufacturing) is now known as 5½-point, and any 5½-point from any foundry can be set in the same line with 5½-point type from any other foundry. This article is set in 8-point type. The well-known size formerly called pica is now 12-point. The point is 0.0138 of an inch, and all type and leads, type-furniture, etc., are now made in even points. Within a few years the Inland Type-Foundry, of St. Louis, has been manufacturing type called "point set," which is made in widths that measure even fractions of a point in the direction of the length of the line. As far as possible the widths are even points and half-points, though in smaller sizes it is necessary to use the quarter-point and eighth-point as the minutest units. The European type-founders have point systems of their own, which are different from the American. Most of their type is made practically of the same height as the American, so that it is possible to print them together in the same page or form, but the differences of body are such that this is not convenient, and very little European type is sold in this country and very little American type sold across the Atlantic.

The Barth automatic type-casting machine was brought out in the Cincinnati Type-Foundry eight years ago, and has been taken up by the American Type-Founders Company, and is now being used to produce a large portion of the body and job type made in America. This machine delivers the type completely dressed and ready for use, requiring only inspection to discover any poor casts that may occur by accident. In England the Wicks rotary type-casting machine was introduced in 1899, and is said to deliver type at the rate of 60,000 an hour, a rate heretofore unknown in type-casting.

Type Composing and Distributing Machines.—Several hundred patents have been granted in England and the United States on machines for doing the work of the compositor. The first machine of any note that attempted to solve the problem of rapid composition was invented by Dr. William Church, of Connecticut, in 1820, and patented in England in 1822, but did not come into practical use. His method was to cast and set the type directly from the molten metal. At the Paris Exposition of 1855, Christian Sörensen, of Copenhagen, exhibited a machine that set type and distributed simultaneously. This also failed of commercial success.

The Alden machine, patented in 1857, and developed in New York, had the type arranged in cells, around the circumference of a horizontal

wheel or cylinder. There were several receivers, which rotated with the wheel, and in their rotation they picked up the type. Its capacity of composition was about 3,500 ems an hour. A great deal of money was spent on this machine, and the company is still in existence.

An English machine, devised by Alexander Mackie, and patented in 1866, was in two parts. One was a little instrument consisting of 14 keys, by means of which a narrow strip of paper was perforated preparatory to being used in the machine proper. This consisted of three flat rings, one above the other, the upper and lower being stationary. On the top ring were 20 pockets, each containing 7 kinds of type. The middle ring traveled around the circle. It had 20 "pick-pockets," each "pick-pocket" being subdivided into 7 legs and 7 fingers. There was a drum over which the perforated paper traveled by a positive motion, about one-tenth of an inch at every movement. The type were gathered from the respective pockets, as the middle wheel went round, and then sent along a delivery-channel to a traveling belt, which carried them along down a siphon spout, one letter upon another, and held ready for justification. The machine is the prototype of the more recent Goodson and Lanston machines.

The Frazer and Kastenbein composing-machines in England and the Burr and McMillan machines in the United States have all met with some success and been sold to some extent in the past twenty years. They may be classed together as gravity machines, in which the types are kept in upright channels and pushed out one at a time from the bottoms of the channels by the operation of a keyboard. They are now all practically out of date, though efforts are being made to modernize them and put them on a basis to compete with the Mergenthaler linotype. About 1895 the Burr was reconstructed as the Empire, and a considerable number were sold. It has since been provided with a justifying mechanism that largely reduces the labor cost.

A large number of other composing-machines have been projected, some of them at enormous cost, yet without finding a market. Among these was the Paige machine, on which nearly \$2,000,000 was spent and lost (the machine being now stored at Cornell University as a mechanical curiosity), the Risley & Lake matrix machine, the Sears typomatrix, Lagerman typotheter, composite type-bar, Goodson matrix machine, Johnson type setter and caster, and others, which are still being experimented with. The Rogers typograph, and also the monoline machine—both somewhat similar to the linotype—were prevented from being used in the United States because of infringing Mergenthaler's patents, but some of them are in use in Europe.

About 1886 the Mergenthaler linotype machine came into commercial use, and after a few years of development and patent suits it took the lead, and since 1894 it has been enormously successful. About 8,000 machines have been sold, and they are still selling at the rate of about 1,000 a year, though the price is \$3,000, with extras. This machine was the invention of Ottmar Mergenthaler, of Baltimore (see Annual Cyclopædia for 1899, page 623), and marks the most radical change in methods of composition since the time of Gutenberg. The line is used as the unit, instead of a single letter. In other words, the machine produces and assembles complete cast lines of type, ready for the column. The machine is worked by finger-keys, as is the typewriter. The fundamental parts are a series of matrices, each containing a single letter or character, and a

series of spacing devices of variable thickness. The matrices are arranged in the channels of a magazine in the upper right-hand corner of the machine, and provided with escapement, so that the operation of a key is followed by the escape of a matrix as required. The space-bars are arranged by themselves, and discharged in like manner by the touch of a key. As the matrices emerge from the magazine they are received on an inclined traveling belt, and delivered, one after another, into a receiver, and assembled into line. When the line is full, the operator touches a lever, and the composed line is transferred

THE MERGENTHALER LINOTYPE.

to the face of a mold. A melting-pot containing a supply of molten type-metal, and provided with a force-pump, is connected with the mold; the casting is made instantly, and the matrices are removed and transferred to the distributing mechanism, by which they are returned to the original magazine channels for further use. The organization of the machine is such that the manipulation of the keys, the casting of the preceding line, and the distribution of a still earlier line, are carried on concurrently and independently. The capacity of the linotype machine is from 3,000 to 10,000 ems an hour, or about five times the speed of a hand compositor. A new face of type is obtained at each casting. The spacing is absolutely uniform, automatic, and instantaneous, by the expansion of the compound space-bars. These spaces are compound wedges, released as required, and at the close of the line are all driven forward until the line space is properly filled.

Though Mr. Mergenthaler was justly entitled to and received the credit of producing this remarkable machine, yet other inventors contributed patents that added much to its commercial success. Among these are John R. Rogers and Philip T. Dodge. A great variety of minor improvements have been added of late years, increasing the usefulness of the linotype. The most recent and valuable of these is the two-letter matrix, which enables both Roman and italic characters to be produced from the same keyboard, through the aid of a shift-key, operated very much as the shift-key of a typewriter.

The present year the Mergenthaler Linotype Company have introduced the "junior linotype" machine, which is an improved and perfected form of the Rogers typograph, and offered it for sale at \$1,500, supplying the demand for a linotype machine in country newspaper offices.

The Scudder monoline machine, producing a product similar to the linotype, is built and sold in Canada.

Thorne's cylindrical type setting and distributing machine was brought out about 1880. It comprises a distributing as well as a setting mechanism, either of which may operate independently, or both work simultaneously. In 1898 it was remodeled and improved, and it is now known as the simplex. The cylinders are mounted vertically one above the other, the dis-

tributing section above and rotating. The type-setting cylinder is stationary. Each cylinder has an equal number of tangentially arranged type-channels, in which the types rest upon their sides in vertical lines, so that when the bottom type of a line is removed the space it occupied is immediately filled by the descent of its line. The distributing-cylinder is caused to rotate by a step-like movement at the top, which brings its channels to coincide with and momentarily rest directly over those of the setting-cylinder. Each type has its appropriate series of nicks, which, coming in contact with the corresponding wards in the channels of the lower cylinder, cause the type to be dislodged and drop into the proper place. In composition the depression of a particular key selects the desired type, which is immediately pushed from the bottom of its line out upon a rapidly revolving disk by means of a rotating driver, which automatically operates the appropriate horizontally moving ejector. The

THE UNITYPE COMPANY'S SIMPLEX TYPESETTING MACHINE.

type, on being ejected from the column recess, is thrown edgewise by the revolving disk against a guard-rail, which rail directs the type lengthwise in its circular travel upon a belt that conveys it to a revolving lifter. By this it is raised into a long setting-stick that extends across the machine in front of the operator. Types successively ejected upon the disk, as their appropriate keys are depressed, follow each other in correct order to the conveying-belt and into a setting-channel. After a quantity equal to six or seven lines in one long strip has been composed, the operator swings his seat over to the left, and takes the lines into a galley and justifies them—that is, spaces out between the words so that every line is of the same length. The distribution of the type is carried on automatically while the composition is being done at the keyboard.

The simplex machine is also to be manufactured with an automatic justifier, in which form it is to be known as the unitype.

The Dow composing- and distributing-machines are now attracting much attention in the printing trade. The composing-machine is the first to be provided with a simple, practical, and inexpensive automatic justifying device. Other type-composing machines have failed to compete successfully

with the linotype because an extra man had to be provided for doing the justification or spacing out of the lines, or because the justifying mechanism provided was too complicated or too costly in its operation. The Dow is the first of the type-setting machines proper that can be operated at a high rate of speed by one man. It is not a gravity machine, like most typesetters, but operates positively, pushing the types with certainty wherever they are wanted. The operator at the keyboard manipulates the keys for a line, decides where to finish the line, ends his word or divides it with a hyphen, and strikes a line-key. The machine then automatically takes the line away, measures the amount of remaining space required to fill the line to the width of the column, divides this space by the number of vacancies between the words in the line, supplies spaces of the proper justifying size, inserts them, and thrusts the completed and perfect line into the galley. In the meantime the operator has been at work on another line, and when that is set the machine handles it automatically as the first, and so on. The distribution is effected by a separate machine, which simply requires to be supplied with "dead" type for distribution, and to have an attendant take away the distributed type, properly arranged in channels for the setting-machine. This distributor will supply enough type for three or four fast operators on the keyboards of the setters. The machines are designed to be used for any ordinary width of measure or size of type, this being the first typesetting machine proper to handle several sizes of type in the same machine.

There are also two or three forms of composing-machines that cast the type and melt it up again instead of distributing. Of these the Lanston monotype has been longest before the public, being first exhibited about 1890. This has been used in several places, formerly on the Philadelphia Inquirer, and now on the New York Sun. The mechanism is ingenious and complicated. The Goodson graphotype is a somewhat similar machine, with much fewer parts. The system used on these machines, originated by Mackie, is based on the use of a punched paper tape, which is prepared on a sort of typewriter. The punched holes represent letters and characters, and when the tape is prepared, it is run backward through a type-casting machine, serving to direct that machine what type to cast. As the type are cast they are set up in lines and columns automatically.

Other composing-machines, known as the St. John, Converse, Johnson, Botz, etc., are announced as in course of preparation, to be marketed within a few years.

Printing-Presses.—The Gutenberg press consisted of a screw, moved by hand, which raised and lowered a platen, thus taking the impression from the form of type placed upon a flat bed. The first advance made upon this was by William J. Blaew, of Amsterdam, about 1620. His press was used in England till the end of the eighteenth century, when the Earl of Stanhope caused to be constructed a press with an iron frame and having a combination of levers to assist the pressman in obtaining a heavier and better impression. In 1827 a hand-press called the Washington, with an improved toggle motion, was invented by Samuel Rust, of New York. This patent became the property of R. Hoe & Co., who since then have made many thousands of these presses, and they are in extensive use to-day for taking proofs and single impressions. The printing-presses in modern use may be divided into several classes: Job

and platen presses are the small machines, frequently run by foot-power with a treadle, used to print stationery, cards, and all sorts of small sheets that are done in small quantities. Cylinder presses are characterized by a flat bed for the type, which reciprocates under a cylinder that gives the pressure for printing. Perfecting presses are those which perfect the sheet by printing it on both sides at a single operation. Web presses print from a roll or web of paper, which is cut up into sheets after printing and before delivery from the machine. In rotary presses the flat reciprocating type-beds are dispensed with, the form usually being made of curved stereotype or electrotypes, mounted on cylinders. This renders it possible to make practically all the mechanism rotary, thus permitting a printing speed about ten times as fast as that obtained from reciprocating type-beds. Rotary presses are usually web presses and also perfecting presses, though flat-bed machines are made that print from the web and that perfect the sheet.

Platen Job-Presses.—The father of the modern platen job-press was the late George P. Gordon, of New York, who received his first letters patent in 1851. He obtained 50 patents, extending over a period of twenty-three years, and brought the machine to a high degree of accuracy, power, and simplicity. In the earlier machines the platen rocked from a horizontal position to receive the impression from a vibrating bed. A simplifying procedure was entered into, and in 1874 the rocking platen was dispensed with, a vibrating platen being substituted. A throw-off was also added, by which an accidental impression was prevented. Further, the adjustment of the parts was so secured that a "dead dwell" or prolonged impression was given on the type before the platen returned. In 1856 the double-disk ink distribution was applied. The demand for cleanliness and clearness in ink-work caused the attempt in 1879 to apply the ink distribution of the cylinder press to the job-press. The system is known as the Glastaeter distribution. The Gordon press has been built in many forms, but that known as the Gordon-Franklin has proved the most popular

from small presses than could be had from those of the Gordon type. The Gordon was simple, and quick, but to meet certain other requirements heavier machines with more elaborate ink distribution were required. Of this class were the Globe, Universal, and Colt's Armory presses. The Globe fell out of use in a few years. The

THE GALLY UNIVERSAL JOB-PRESS.

or Universal press was invented by Merritt Gally, of New York, and patented in 1869. The bed and entire framework of the machine are in one solid casting, thus making the bed rigid, and obviating the possibility of shaking joints. The combination of the platen and crank movement is a special feature, and causes three distinct stages of the platen motion: first, a stop for feeding the sheet, the platen standing at a slight angle; second, a rolling action, bringing the platen parallel with but standing away from the form; third, a forward slide to the impression, where it meets the type direct and square. The press has been successfully used for heavy letterpress and illustrated work, paper-box cutting and creasing, inlaying book-covers, stamping and embossing, printing on tin, wood, etc. The adjustment provides for printing material of any thickness from tissue-paper to $2\frac{1}{2}$ inches. In addition to the corner-screws for setting the platen the press has an impression-adjuster. There is a graduated arc and slide, by means of which a latch may be set to any position on the arc, thus adjusting the impression to any degree of pressure without changing the tympan.

The Thomson Colt's Armory press is of the most solid and strong construction, being designed to bring up the heaviest forms of half-tone or other difficult work. The distribution-cylinder is supplied with a great number of vibrating and other rollers, so that the ink is cut up to the last degree of fineness. The design of this press is mechanically as accurate as any machine can be, and so positive is the register, so firm the impression, and so delicate are the adjustments that the machine is commonly used for the highest grade of three-color and other difficult work.

The Golding jobber is of a type half-way between the two classes described. It is designed to have the speed and easy working of the Gordon, with the capacity for ink distribution and strong impression of the Universal type of presses. It has convenient special devices, and is admirably adapted to a wide range of com-

THE CHANDLER & PRICE COMPANY'S GORDON PRESS.

and outsold any other form of printing-press. The machine as now made by Chandler & Price, the largest manufacturers, is illustrated herewith.

The cylinder-distribution type of platen-jobber was introduced to secure a higher grade of work

cial work. It has been imitated by foreign builders, as have most of the machines named.

The Degener Liberty press was manufactured and sold very widely in the sixties and seventies. The Peerless press also sold very largely in the seventies and eighties, but these machines are now almost out of use. A large variety of machines similar to those described are manufactured and sold under various names all over the world.

Cylinder Presses.—In order to comprehend the working of cylinder presses, it should be understood that each one ordinarily has a flat bed, geared to reciprocate at an even speed with the revolving cylinder. The sheets of paper are fed to the cylinder, and in its revolution are carried on the inked form until printed. The stop-cylinder press is one in which, after the sheet is printed, the cylinder is brought to a stop while the bed is running back, and during this time a fresh sheet is placed in position. In the double-cylinder press, two cylinders are used, and they take sheets alternately. In a two-revolution press there is but one cylinder, and it makes two revolutions, once in contact with the type and once in a slightly raised position while the type is passing back without contact. The drum-cylinder press has a cylinder of large diameter that makes but one revolution to each impression, a segment of the circumference only coming in contact with the type. The first press of this character was devised by Frederick Koenig, a Saxon, about 1806. He introduced these machines into England, in connection with a fellow mechanic named Bauer, placing them first in the office of the London Times. Koenig also invented, about 1814, a press in which the cylinder continuously revolved—that is, it was made to rise on the return motion of the bed, and then to fall again to take the impression as the bed moved under it. The first practical cylinder presses made in the United States were manufactured by the firm of R. Hoe & Co., who also introduced here, in addition to their own patents and improvements, the new devices patented in England by Cowper, Applegath, Napier, and other English makers. As already stated, this firm was established in New York by Robert Hoe before 1820, but these cylinder presses were not introduced into the market to any extent until 1832. Improvements were made in them, the cylinder being reduced in size and arranged to make two or three revolutions to each motion of the bed, thus giving greater speed. Every effort was made so to perfect the movements of the bed backward and forward as to give a greater yield per hour, to supply the demands of newspapers, which were then coming into vogue and having constantly increasing circulations.

The press known as the "stop-cylinder" was first patented and manufactured in 1852 by a Frenchman named Dutartre, and was introduced with patented improvements in the United States by Hoe & Co. in 1853. Machines of this kind, with various alterations and additions, were also made by Campbell, Cottrell, Potter, and others. The stop-cylinder was much favored for many years, because the bringing of the cylinder to a dead stop at the time of the taking of the sheet afforded opportunity for perfect register—that is, printing of the sheet absolutely in the same place at every impression. The two-revolution press was a faster machine, however, and preferred on that account for less particular work. About 1885 Robert Miehle devised a new bed movement for two-revolution presses, besides other useful devices, and built a two-revolution press that gave

increased accuracy and speed. In a few years this press became so popular that it began to drive out the stop-cylinder, and as a consequence many makers have introduced higher grades of two-revolution presses, which meet every demand of quality and can be operated as rapidly as the paper can be supplied by hand.

Hoe & Co. brought out in 1846-'47 what was known as the "Lightning" press, a type-revolving machine, and for several years it was the only available press for daily journals requiring a large edition. In this machine the type was placed upon horizontal cylinders, the column-rules being made V-shaped, so that the type should stand firmly on its feet on the curve, and it was locked up securely by means of screws. Around this cylinder were placed other horizontal cylinders, and the paper was fed directly by each feeder to the impression-cylinder, the patented sheet-flier being brought into play to deliver the sheets on as many separate delivery-tables. Even these were found inadequate to meet the demands of the increasing circulations of the larger journals. Furthermore, ten men as feeders were required on the largest of these machines. Stereotyping on the curve, from papier-maché molds, was introduced about this time, which enabled the duplication of forms at small expense. The first rotary perfecting press that printed from a continuous web or roll of paper was made in Philadelphia in 1865, by William Bullock. His machine was imperfect in the delivery. Meanwhile the proprietors of the London Times made a press known as the Walter, which was used in only one or two offices besides the Times. Marinoni, of Paris, also made presses on a similar principle, with separate fly-boards for delivering the sheets, which were handled by boys. In 1871 Hoe & Co. constructed a press that superseded all these. By means of a patented device, with a gathering-cylinder for receiving the sheets as they came from the press, they were delivered in lots of six papers at a time by a sheet-flier in an even pile. From one set of stereotype plates 15,000 papers an hour were produced. This machine was introduced in most of the large newspaper establishments, and in some instances, owing to the possibility of duplicating the forms by curved stereotype plates, 10 or 12 of these presses were placed in a single office.

Folders.—Up to this time the folding of newspapers was done by hand, by the newsdealer or the carrier. But increasing circulations necessitated some method by which the papers could be folded automatically and as they came from the press. The earliest of these consisted of a series of striking blades forcing the paper consecutively between rollers at right angles, there being a blade for each fold required; but the action of the blades was not rapid enough to keep up with the production, and it was necessary to have for each machine substantially two separate folders on this plan, which was based on the book-folding machines fed by hand, which had been made by Chambers Brothers, of Philadelphia. Something simpler and with less mechanism became a necessity, and the first rotary folders were made by Hoe & Co. in 1875. These were applied to "single" machines.

Large Stereotype Perfecting Machines.—In 1876 Anthony & Taylor, of England, took out patents for methods of turning paper in the web, or roll, so as to present the reverse side to the printing-cylinder before cutting off the sheets. These patents, as well as the patents of L. C. Crowell, of Boston (who had devised ingenious machines for making paper bags), became the property of Hoe & Co., and from these and addi-

tional inventions of their own they evolved the perfect folding apparatus used upon the large double-supplement, quadruple, sextuple, and octuple machines made by them. These presses have revolutionized the art of printing newspapers. They print upon 1, 2, or 3 rolls of paper, giving 4-, 6-, 8-, 10-, 12-, 14-, 16-, 20-, or 24-page papers, as required, delivered folded, pasted, and counted, in piles, at speeds varying from 12,000 to 150,000 perfect papers an hour. These machines may be seen in all the large newspaper offices in the United States, Great Britain, Australia, and New Zealand. The largest of them weighs about 58 tons, and is composed of 16,000 separate parts; but, notwithstanding the number of pieces composing these machines and their apparent intricacy, they are extremely simple in principle and in operation. All the devices in them, including the triangular formers and the principle of handling the paper and keeping it entirely in the endless sheet, or web, until the final fold, are the result of great study and ingenuity, and the subjects of many patents.

Rotary Machines.—The great improvements in the making of electrotypes plates, and the increased economy and accuracy with which they can be produced, have led to their use upon rotary presses. These machines are often referred to as magazine presses, being adapted to the wants of magazines or other illustrated publications requiring a good grade of work at a high rate of speed. Such machines not only print papers of multiple pages, but place upon them, automatically, covers of different colored paper, and stitch the product together with wire staples as the papers issue from the machine, at the running speed of 12,000 or more copies an hour.

The rotary principle has been carried to still greater perfection for fine wood-cut and half-tone work in machines made for Theodore L. De Vinne & Co., printers of the Century Magazine. These machines deliver the pages of periodicals and other similar work, printed on both sides, in signatures, folded together, without smutting, and ready for the binder. Some are made to print from the endless roll, and others to feed by hand; but the curved electrotypes plate is used in all, it being found that equally good work and greater economy in production may be had from the rotary system than from the cylinder presses that take the impressions from type or plates placed upon a reciprocating flat bed. Simultaneous polychromatic printing on the rotary system is one of the most remarkable developments in newspaper and periodical printing. Many journals now print, with their large weekly editions, illustrated supplements in colors and half-tone, one side of the sheet having colors and the other having engravings in black. These machines print at the rate of about 26,000 4-page sheets an hour. They print from curved electrotypes plates, the cylinders being arranged so as to give a separate impression surface for each color. The papers are delivered folded, without marring the pictures.

The Scott rotary web perfecting press is the production of Walter Scott, who began life as an engineer and pressman on a Chicago daily. It was originally an elaboration as well as a systematizing of the Bullock. Scott constructed the first combined printing and folding machine that fed from a roll and produced perfect copies,

cut, pasted, and folded, at one operation. Within recent years his rotary press has been greatly developed. The factory of Walter Scott & Co., at Plainfield, N. J., is one of the largest in the country, and turns out nearly 40 styles of rotary web perfecting presses for newspapers and periodical printing. The straight-run machine shown in the illustration receives paper from rolls at 4 different levels, and prints on both sides, then brings all the paper together, folding, cutting, pasting, and delivering as complete newspapers. It is really 4 8-page printing-machines arranged in stories, to produce 32-page newspapers, or any regular less number, as 24, 16, 8, as may be desired. It is also built of double width, with quadruple folders, in which form it will deliver 100,000 8-page papers completed within one hour.

Among the smaller web machines made by Scott & Co., the "all-size" rotary has attracted much attention. Most rotary web printing-presses are built to produce newspapers or periodicals of a certain size, and they will not print a larger or smaller page, though the number of pages issued at a printing is variable. In the "all-size" rotary, any size of page within the capacity of the machine may be produced, the

SCOTT'S FOUR-ROLL STRAIGHT-RUN PERFECTING PRINTING MACHINE.

graduations being in quarter inches. In 1899 Scott & Co. brought out a new two-revolution press with a flyless delivery, and a new bed motion permitting of high speed with accurate register. This machine has been very successful, but has been almost eclipsed by Mr. Scott's latest invention, in which he has combined the good points of the stop-cylinder and the two-revolution machine. This press, as arranged for lithographic work, is illustrated herewith. The bed motion is new to this side of the Atlantic, being an improvement on the German type of "sun and planet" driving gear. The cylinder is made two-revolution, so as to secure small diameter, and is geared to the bed throughout the printing stroke. It comes to a full stop at the point of taking the sheet, thus insuring absolute register, without that loss of speed which has been the drawback to the stop-cylinder class of presses.

The Campbell Printing-Press Company became famous through the inventions of Andrew Campbell. He was the first to build a simple cylinder press for country newspapers, one that could be run without skilled labor, and would do good work, and thousands of them are in use to-day. He built a whole line of cylinder printing-machines for all classes of work, his crowning effort being the production of a web perfecting press in 1875. This machine printed, inset, pasted, and folded any number of pages up to 24. It had

automatic dampening apparatus, positive rotary movements, no tapes, a space for a type column besides the stereotype plate, for the addition of late news, and numerous other devices in use in present-day machines. Campbell built three of these presses, and then sold his patents to Hoe & Co., who thereafter for several years controlled this class of machines. Within recent years the machinery for the Campbell Company has been designed by Henry A. Wise Wood, general manager of the company, who has produced the Century, New Model, and Multipress machines. The Century press is a two-revolution cylinder machine, for high-class work at high speeds. The speed was secured largely through a new bed movement, which imparted an even movement to the cylinder during the printing stroke. The methods of supporting the bed and bracing the cylinder also gave increased rigidity, while the gearing together of the bed and cylinder compelled accurate register. Minor devices insured accuracy in the taking of the sheet from the feed-table. The press has been widely introduced for three-color printing and other work difficult of registration, or requiring superior ink distribution. The Multipress is a flat-bed perfecting machine, printing from type. It is based on the original Stonemetz patent, and is especially adapted for the use of newspapers that wish a perfecting press that avoids the use of a stereotype plant. The type-beds are stationary, on different levels, and the cylinders reciprocate over them. The machine does four times the work of an ordinary cylinder press, and dispenses with the hand feeder. The New Model is a web stereotype perfecting press of very simple construction, for general newspaper use.

GOSS THREE-DECK STRAIGHT-LINE PERFECTING PRESS.

The Cottrell cylinder presses were brought out by C. B. Cottrell, of Westerly, R. I., who built a variety of forms, consisting mainly of stop-cylinders, drum-cylinders, and two-revolutions. He was among the first to appreciate the value of delivering the sheet printed side up. He did much to perfect the air-spring, which has now been adopted by nearly all manufacturers for reversing the type-beds without severe jar. The firm is now C. B. Cottrell & Sons Company, and within recent years it has made great progress in the development of machines suited to the manufacture of magazines and periodicals of large circulation. Its flat-bed perfecting press with shifting tympan has been a great boon to the dime magazines, which required faster work than the single-cylinder could produce, and better printing than could be had from the ordinary web perfecting machine. The trouble in doing fine work on a perfecting press has been that, in printing the second side of the sheet immediately after the

first side, there was not time for the ink to dry, and it offset against the tympan or printing surface of the press and smutted succeeding sheets. On the Cottrell perfecter the tympan is entirely changed or shifted every one, two, three, or five minutes, as desired, the shift being set so that there is always a clean tympan back of the paper, to absorb any surplus of ink before it can offset. The sheets are fed into this machine, as into an ordinary cylinder press, by hand or with automatic feeding-machine, and are printed on one side from the first cylinder, then transferred to a second cylinder, which prints the second side, and then delivered perfect on a table. This not only saves a second feeding and printing, but the labor of spreading, drying, jogging, etc., between printings. The whole success of the machine hangs on the admirable self-shifting tympan, which can be changed in a second's time while the press is running at high speed. The floor space occupied is only one foot greater in length than for a single-cylinder machine.

The Goss Printing-Press Company, of Chicago, has developed a line of web perfecting machines for daily newspapers, based principally on the patents of Joseph L. Firm, of Jersey City. They are largely in use. One of its most ingenious devices is an offsetting arrangement which absorbs all the extra ink from the newly printed page, and transfers it to a cylinder, whence it is wiped off by a cloth-wound roller. The inventor, acting upon the fact that a composition roller of glue and molasses has a suction power upon the surfaces upon which it moves, conceived the idea of making such a roller act as a blotter on the newly printed pages. He arranged a pair of composition rollers to pass over the sheet on its transit to the second form, and remove the surplus ink. Before the roller had in its revolution touched the printed paper again, it had passed against a polished steel cylinder, on which it left its ink; in other words, the roller took up the ink and transferred it in its revolution to a receiving-cylinder, which in its turn was kept clean by a cylindrical cotton wiper. The apparatus occupies an exceedingly small space, and is comparatively inexpensive. This combination obviates the necessity for the use of endless aprons or blankets, slip or blank sheets, rolls in the web, or cylinders or rollers of any kind for the printed sheet to travel over.

The Goss press is the regular three-deck straight-line press, with three-color mechanism added on the top deck, so that the machine will print a newspaper in black, but with four colors on the two outer pages.

The Huber cylinder presses are distinguished by the use of a simple crank movement of the bed, which affords very smooth running, without cams or cam-gears. The Huber Press Company builds a variety of styles for general commercial printing, including a double-inking book-press. They also make a sheet-perfecting press, commonly abbreviated to "perfecter," this being a machine with 2 cylinders, one for printing on each side of a sheet, so that it delivers the sheet printed on both sides, or "perfected." The offsetting de-

vice consists of 2 wiping rollers covered with plush having a long silk nap, traveling in opposite directions at twice the surface speed of the cylinder. These rollers are kept thoroughly lubricated, and are automatically brought into contact with the tympan of the second impression-cylinder, twice before each impression, rendering it free from contaminating matter. This machine is adapted to a high grade of work. Another Huber press has two cylinders, each for printing a different color. The method of carrying the sheet from one color-cylinder to the other insures absolute register, and the speed is 10,000 sheets a day, or about the same as a one-color machine. It is in demand for labels, fancy posters, and similar work.

The Whitlock cylinder printing-presses were originally based upon what was known as the Henry bed movement, but as the two-revolution class of machines was improved, they were built with a crank movement, modified by elliptical gears, thus securing an ideal motion. The flyless delivery and modern minor devices have placed these machines in the front rank.

The Babcock Printing-Press Company have built cylinder presses for many years at New London, Conn. Their most important machine at this time is the Optimus, a two-revolution cylinder, which contains many improvements that are radical departures from old ideas. The innovations are chiefly the inventions of George P. Fenner, of New London, Conn. The sheet is delivered printed side up and stops on its journey after it leaves the cylinder, and is exposed to the view of the feeder, while the next sheet is being printed and taken up, so that it can be fully inspected both as to ink and register. The press is especially convenient for making ready. It has a still gripper, whose motion exactly coincides with that of the cylinder at all speeds—a most important matter in its relation to the register—and uniformity of margin. It has an improved air-cushion, an adjustable piston, a special reversing mechanism, and an impression trip, which can be operated instantly and effectually. There is also a cylinder-lifting mechanism, which dispenses with the heavy counterbalancing used in some other presses.

The Cox Duplex newspaper press is made in Battle Creek, Mich., and was developed for the purpose of providing a moderately fast web machine to print from type, as desired by many daily newspapers with 3,000 to 10,000 circulation. The type-beds are placed one above the other, and are stationary, while the cylinders roll back and forth upon them, and the web of paper, which winds in and out between the cylinders, type, and rollers, is drawn forward the width of one newspaper at each reversal of the cylinders. As two impressions are made during the travel of the cylinders in each direction, the result is a quadrupling of the work that can be done on a single cylinder press, and hand-feeding is dispensed with.

The Kidder Company, of Boston, have built many styles of web feeding-machines for special work, and there are other press-builders in the United States who have built good machines more or less similar to those that have been described above, which have been selected as typical of certain classes. One special design of press that forms a class by itself is the Harris Automatic Press, of Niles, Ohio. This is a rotary job-press, designed for doing the work of the small platen-machines at a much greater speed. It has tiny cylinders and is mounted on a pedestal. For envelopes and cards there is an automatic feed, so that these can be printed at six

or eight times the speed possible with hand-feeding on a platen-jobber. Many sheets require to be hand-fed on the Harris press, but can be put through at three times the speed of the ordinary job-press. The printing surface is not a fixed electrotype plate, but the method is such that type can be adapted to direct use to some extent.

Automatic Paper-Feeding Machines. Until about 1875 no other way of feeding the paper into printing-machines had been devised than by the tedious method of placing the sheets in position one at a time by hand; but the introduction of rotary presses supplying the paper from a roll turned the attention of inventors to the problem of feeding single sheets automatically. One of the first successful machines of this class was the Economic paper-feeder sold by E. C. Fuller & Co., of New York. This was introduced to feed book-binders' ruling-machines, and was generally adopted for that purpose. As ruling-machines commonly use only papers of good quality, and not very large sheets, the problem was not so serious as was the feeding of sheets to cylinder presses that take on all qualities and sizes of sheets. After an expenditure of a very large amount of money, however, the machines were perfected so that they could be applied to cylinder presses with economy, and these feeders are in use in many large book-printing houses and in magazine-publishing plants, as well as private offices.

The Dexter Folder Company, of Pearl River, N. Y., also went into the manufacture of feeding-machines, and T. C. Dexter took out a large number of patents, which cover the improvements embodied in their machines. The Dexter feeders use purely mechanical devices, avoiding electrical attachments. One of the great difficulties in securing exact operation from this class of machines has been the tendency of the sheets to stick together. In the Dexter feeder, if more than one sheet is advanced from the pile, a mechanical sheet-caliper attachment discovers the fact, and sets in play mechanism for stopping the printing-machine so that the attendant can remedy the difficulty before any damage results. The squaring of the sheet as it approaches the guides of the printing-press is accomplished automatically, even if the sheet is not placed squarely in the pile from which the paper is being fed.

Several other automatic paper-feeding machines are before the public, or in a condition to be placed on the market shortly.

In the bookbinding branch of the printing industry a variety of machinery has been introduced, the most recent and important of which is Sheridan's case-making machine, which makes what are technically called book-cases—that is, covers for books—automatically at the rate of 22 a minute. The boards for the sides and the cloth are supplied automatically, and the machine puts all together with greater precision than it can be done by hand, besides saving cloth and glue. The case-maker is such a labor-saver that within a very short time it has found its way into all the larger cities of the world.
